- iii. What is the impact of Agile Adaptive Planning (AAP) on the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria?
- iv. How does Agile Continuous Integration and Testing (ACIT) contribute to the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria?

Objectives of the Study

The main objective of this study is to investigate the impact of agile methodologies on the organizational performance of selected aluminum manufacturing

firms in Delta State, Nigeria. The specific objectives are:

- i. To examine the impact of Agile Iterative Development (AID) on the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.
- ii. To assess the influence of Agile Collaboration and Communication (ACC) on the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.
- iii. To determine the impact of Agile Adaptive Planning (AAP) on the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.
- iv. To evaluate the contribution of Agile Continuous Integration and Testing (ACIT) to the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.

Research Hypotheses

H₀₁: Agile Iterative Development (AID) has no significant impact organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.

H₀₂: Agile Collaboration and Communication (ACC) has no significant impact organizational

team collaboration, and responding quickly to market or operational changes (Highsmith, 2020).

The principles of Agile, including collaboration and continuous feedback, are particularly valuable in complex environments where projects and processes are subject to frequent change. In manufacturing, Agile helps firms adapt to fluctuations in market demand, production schedules, and supply chain disruptions (Dingsøyr et al., 2020). However, the adoption of Agile in manufacturing sectors like aluminum production remains under-explored, creating a gap in understanding how these methodologies can be effectively applied to enhance organizational performance (Li et al., 2020).

Agile Iterative Development (AID)

Agile Iterative Development (AID) refers to the practice of breaking down large projects into smaller, manageable iterations or cycles (sprints), with each iteration producing a tangible outcome or product feature (Beck et al., 2020). Each iteration is typically followed by a review, allowing teams to make adjustments and improvements based on feedback before moving to the next phase. This iterative process helps organizations respond to changes quickly, reducing risks and ensuring that the final product meets evolving requirements (Conforto et al., 2021).

performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.

H₀₃: Agile Adaptive Planning (AAP) has no significant impact organizational performance

(ORGP) of aluminum manufacturing firms in Delta State, Nigeria.

H₀₄: Agile Continuous Integration and Testing (ACIT) has no significant impact organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria.

ptual Review

Agile Methodologies

Agile methodologies have become widely adopted in industries outside of software development, particularly in sectors where flexibility, adaptability, and speed are crucial for operational success. Agile methodologies emphasize iterative development, continuous improvement, close collaboration, and responsiveness to change (Beck et al., 2020). Originally developed for software projects, Agile approaches have been successfully adapted to various industries, including manufacturing, to improve project outcomes, efficiency, and innovation (Vaidya et al., 2020). Agile's core principles include delivering working products incrementally, encouraging

In manufacturing, AID helps organizations manage the complexity of production processes by focusing on incremental improvements, which can lead to more efficient workflows and higher product quality (Humble et al., 2021). By implementing AID, manufacturing firms can address issues such as long lead times and fluctuating customer demands by refining their processes step-by-step. However, the integration of AID in aluminum manufacturing has not been well documented, and further research is needed to evaluate its impact on production efficiency and performance.

Agile Collaboration and Communication (ACC)

Agile Collaboration and Communication (ACC) emphasize the importance of effective communication and teamwork in achieving project success. ACC encourages cross-functional teams to work together, share knowledge, and engage in continuous dialogue to ensure that everyone is aligned with the project's goals and progress (Humble et al., 2021). Frequent interactions among team members and stakeholders, coupled with transparent communication, enable quick decision-making and foster innovation (Vaidya et al., 2020).

In the context of manufacturing, ACC can be particularly valuable for fostering better coordination among departments involved in the production process,

such as design, production, and quality assurance teams (Sharma et al., 2022). For example, regular communication between teams allows for the identification of bottlenecks, quality issues, and potential improvements early in the production cycle. ACC also contributes to a positive organizational culture, where employees are more engaged and motivated (Dingsøyr et al., 2020). However, the extent to which these practices influence organizational performance in the aluminum manufacturing sector remains underexplored.

Agile Adaptive Planning (AAP)

Agile Adaptive Planning (AAP) is a critical component of Agile methodologies, allowing organizations to adjust their plans and strategies based on changing circumstances, feedback, or new information (Beck et al., 2020). Unlike traditional project management approaches, which rely on rigid, long-term plans, AAP allows manufacturing firms to remain flexible and responsive to unforeseen challenges, such as supply chain disruptions or changes in customer preferences (Conforto et al., 2021). This adaptability is essential for firms in competitive sectors like aluminum manufacturing, where production schedules and market demands are often unpredictable (Sharma et al., 2022). AAP promotes the idea that planning is a dynamic and ongoing process, rather than a one-time event, and encourages continuous reevaluation of project goals and timelines (Li et al., 2020). For aluminum manufacturers, this means that production strategies can be refined continuously, ensuring that firms are always working towards the most relevant goals. However, despite its potential benefits, the adoption of AAP in the manufacturing sector has not been thoroughly studied, especially in regions like Delta State, Nigeria.

Agile Continuous Integration and Testing (ACIT)

Agile Continuous Integration and Testing (ACIT) is a practice where software or product features are integrated and tested continuously throughout the development cycle. This process ensures that any issues are detected early, and that the final product meets the required standards of quality and reliability (Humble et al., 2021). While ACIT is commonly associated with software development, its principles can be applied to manufacturing processes where continuous testing and integration are necessary to ensure product consistency and quality (Bhardwaj et al., 2022).

For aluminum manufacturing firms, ACIT can facilitate improvements in production processes by ensuring that quality checks are carried out throughout the production cycle, rather than just at the end (Dingsøyr et al., 2020). This approach helps to detect

and resolve defects early, reducing the likelihood of delays or costly rework. Furthermore, ACIT fosters a culture of continuous improvement, where teams are encouraged to identify opportunities for process optimization regularly. However, research on the application of ACIT in the manufacturing industry is sparse, particularly in developing economies like Nigeria, which presents an opportunity for further investigation.

Organizational Performance (ORGP)

Organizational performance (ORGP) refers to a company's ability to achieve its goals and objectives through effective management of resources, processes, and operations (Munteanu et al., 2021). In the context of manufacturing firms, organizational performance is often measured through indicators such as product quality, lead time, operational efficiency, profitability, and customer satisfaction (Vaidya et al., 2020). The implementation of Agile methodologies is believed to improve these indicators by promoting greater efficiency, flexibility, and responsiveness to market changes (Li et al., 2020).

Agile methodologies can positively affect organizational performance by enabling firms to improve product quality, reduce lead times, enhance customer satisfaction, and adapt to market changes more quickly (Humble et al., 2021). In the aluminum manufacturing sector, the integration of Agile practices can lead to streamlined processes, higher production efficiency, and the ability to quickly adjust to shifting customer needs and market conditions (Bhardwaj et al., 2022). Despite the potential advantages, the relationship between Agile practices and organizational performance in aluminum manufacturing has not been extensively studied, especially within the Nigerian context.

Theoretical Review

To understand how these Agile practices contribute to organizational performance, it is essential to examine the theoretical frameworks that support Agile methodologies, including Lean Theory, Complex Adaptive Systems (CAS) Theory, and Empirical Process Control Theory. This section explores the origins of these theories and their relevance to Agile practices, specifically in the context of aluminum manufacturing firms in Delta State, Nigeria.

Lean Theory (Lean Software Development)

Lean Theory, originally developed in the context of manufacturing, has its roots in the Toyota Production System (TPS), which was introduced by Taiichi Ohno and Eiji Toyoda in the 1950s. Lean focuses on eliminating waste (non-value-adding activities), improving quality, and increasing efficiency through

continuous improvement (Womack & Jones, 2020). Lean principles were later adapted to software development in the early 2000s by Mary and Tom Poppendieck, who coined the term "Lean Software Development" (Poppendieck & Poppendieck, 2020). Lean Software Development applies the core principles of Lean, such as eliminating waste, empowering teams, and enhancing flow, to software projects by promoting iterative and incremental development processes (Womack & Jones, 2020).

Lean's alignment with Agile methodologies is clear, particularly in Agile Iterative Development (AID) and Agile Continuous Integration and Testing (ACIT). Lean's emphasis on eliminating waste directly correlates with the Agile practice of breaking down projects into smaller, manageable iterations, where teams continuously refine products and processes based on feedback (Humble et al., 2021). Moreover, Lean's focus on increasing efficiency and reducing cycle times complements Agile's aim to produce incremental improvements in short bursts. In the context of aluminum manufacturing firms in Delta State, Nigeria, adopting Lean Software Development principles through Agile practices can lead to reduced production costs, improved operational efficiency, and better product quality, all of which contribute to enhanced organizational performance (Vaidya et al., 2020).

Complex Adaptive Systems (CAS) Theory

Complex Adaptive Systems (CAS) Theory emerged from the study of systems that are composed of multiple interacting components, where the behavior of the system as a whole cannot be easily predicted from the behavior of individual components (Holland, 2020). CAS Theory is grounded in the idea that systems, such as organizations, evolve over time through interactions and feedback loops between their components, which allows them to adapt to changing environments. In the early 1990s, the application of CAS principles to organizational theory was popularized by scholars such as Stacey (2020), who emphasized the importance of adaptability, flexibility, and learning within complex systems.

CAS Theory is particularly relevant to Agile methodologies, as Agile values self-organizing teams, flexibility, and responsiveness to change—key tenets of CAS. Agile Adaptive Planning (AAP) embodies the CAS principle of continuous adaptation, as plans are adjusted based on evolving feedback and market demands (Beck et al., 2020). Furthermore, Agile Collaboration and Communication (ACC) align with the CAS notion of interdependent agents working together to solve problems and innovate (Vaidya et al., 2020). By applying CAS principles to the context of aluminum manufacturing firms in Delta State, Nigeria, organizations can foster a culture of collaboration,

flexibility, and rapid adaptation to market conditions, resulting in improved decision-making and better overall performance (Conforto et al., 2021).

Empirical Process Control Theory

Empirical Process Control Theory, or the Theory of Empiricism, originates from the field of scientific methodology and was adopted by the Agile movement to guide decision-making in environments with high uncertainty and complexity (Schwaber & Sutherland, 2020). This theory emphasizes that knowledge comes from experience and that decisions should be based on what is observable and measurable in the real world rather than theoretical predictions. Empirical Process Control relies on three key principles: transparency, inspection, and adaptation (Schwaber & Sutherland, 2020). Transparency allows all stakeholders to have a clear view of the process and progress, inspection involves frequent checks to detect any issues, and adaptation refers to the continuous refinement of processes based on insights from inspections.

The connection between Empirical Process Control Theory and Agile methodologies is particularly evident in Agile Iterative Development (AID) and Agile Continuous Integration and Testing (ACIT). Both practices are grounded in the idea of frequent testing, feedback loops, and continuous improvements based on empirical evidence. In the context of aluminum manufacturing, AID helps to iterate on products in manageable cycles, while ACIT ensures that product quality is consistently measured and improved through real-time testing (Dingsøyr et al., 2020). By applying Empirical Process Control, aluminum manufacturing firms can make data-driven decisions and continuously adapt to changing conditions, leading to improved performance metrics such as reduced defects, shorter lead times, and increased customer satisfaction (Humble et al., 2021).

Relevance of Theories to Agile Methodologies and Organizational Performance

The application of Lean Theory, CAS Theory, and Empirical Process Control Theory to Agile methodologies has significant implications for the organizational performance (ORGP) of aluminum manufacturing firms in Delta State, Nigeria. Lean Theory enhances Agile practices by focusing on the elimination of waste and improving efficiency, directly impacting organizational performance by reducing costs and increasing product quality. CAS Theory fosters a culture of adaptability and collaboration, encouraging teams to continuously respond to feedback and change, which can enhance decision-making and innovation in manufacturing processes. Finally, Empirical Process Control Theory ensures that Agile practices, such as AID and ACIT, are grounded in real-

world data and continuous improvement, leading to greater operational efficiency and customer satisfaction. By integrating these theories with Agile methodologies, aluminum manufacturing firms can optimize their production processes, foster better team communication and collaboration, and respond more effectively to market demands. In turn, this will lead to enhanced organizational performance, characterized by improved product quality, increased production efficiency, and a more competitive position in the market.

Empirical Review

In a study by Akinbile and Adepoju (2022), the relationship between Agile Collaboration and Communication (ACC) and organizational performance was examined in Nigeria's financial services sector. The objective was to determine how improved collaboration and communication within Agile teams affect service delivery and customer satisfaction. The research employed a descriptive survey design, with data collected from 25 financial institutions in Nigeria. Data analysis was conducted using SPSS and correlation analysis. The findings revealed that Agile communication practices positively impacted service delivery, with firms reporting better customer satisfaction scores when Agile methodologies were implemented. The study concluded that Agile practices significantly improve organizational performance in the service sector and recommended that financial institutions in Nigeria embrace Agile communication techniques to foster better customer relationships.

In a 2022 study, Adebayo and Olatunji investigated how Agile Adaptive Planning (AAP) influenced the organizational performance of Nigerian construction firms. The study aimed to assess how AAP contributes to project success, particularly in terms of cost management and timely delivery. A mixed-method approach was used, combining surveys and interviews with project managers from 15 Nigerian construction firms. The data were analyzed using SPSS and ANOVA. The study found that firms using Agile Adaptive Planning experienced better cost management and were able to deliver projects on time. The study concluded that AAP has a significant positive effect on project performance and recommended that construction firms in Nigeria adopt Agile planning techniques for more efficient project execution.

In another study, Olajide et al. (2022) investigated the impact of Agile methodologies on the organizational performance of Nigerian service industries. The main objective was to determine how Agile Collaboration and Communication (ACC) affects teamwork, employee satisfaction, and service delivery in Nigerian firms. The researchers utilized a cross-sectional survey

design, distributing questionnaires to employees of 30 service firms across Nigeria. Data were analyzed using multiple regression analysis. The results showed a strong positive correlation between effective communication and collaboration and higher levels of employee satisfaction and improved service delivery. The study concluded that fostering a culture of collaboration within Agile teams could lead to higher performance outcomes in service industries. It recommended the implementation of Agile communication practices to enhance teamwork and service quality in Nigerian firms.

In 2021, Chukwu and Eze examined the effect of Agile Iterative Development (AID) on organizational performance in the Nigerian oil and gas industry. The study's main objective was to assess how iterative development processes impact project completion and operational efficiency. Data were collected using a structured questionnaire distributed to 10 oil and gas firms in Nigeria. Data analysis was conducted using multiple regression analysis. The findings revealed that AID led to better project completion rates and improved operational efficiency. The study concluded that Agile Iterative Development was instrumental in optimizing project execution in the oil and gas sector. It recommended that Nigerian oil and gas firms adopt Agile practices to improve project performance and competitiveness.

Literature Gaps

The empirical studies reviewed above highlight the growing interest in examining the impact of Agile methodologies, particularly Agile Iterative Development (AID), Agile Collaboration and Communication (ACC), Agile Adaptive Planning (AAP), and Agile Continuous Integration and Testing (ACIT), on organizational performance (ORGP) across different sectors in Nigeria. While several studies have contributed to understanding how Agile practices can enhance performance in various industries such as IT, manufacturing, construction, and service sectors, there remain several research gaps that warrant further exploration. These gaps include limitations in the scope of findings, variables considered, methodologies applied, and the geographical focus of the studies. Findings Gaps: Although a significant number of studies have shown positive correlations between Agile methodologies and organizational performance, many findings are confined to specific aspects of performance, such as project success, cost reduction, or product quality. For instance, Adedeji et al. (2020) found a strong link between Agile practices and productivity, but their study did not explore other performance metrics like innovation or market competitiveness. Similarly, Olajide et al. (2022) focused on the link between ACC and service delivery

but did not consider broader organizational performance outcomes such as employee retention or financial performance. Additionally, while the studies predominantly highlight the benefits of Agile practices, more research is needed to explore potential challenges or negative outcomes associated with Agile adoption, such as resistance to change or initial implementation costs. Future studies should aim to provide a more comprehensive understanding of the multifaceted impact of Agile practices on organizational performance (Adedeji et al., 2020; Olajide et al., 2022).

Variables Gaps: The studies reviewed often focus on a limited number of variables when assessing the impact of Agile methodologies on organizational performance. While variables like productivity, cost reduction, and service quality are commonly explored, other crucial variables such as employee engagement, innovation, and organizational culture are often overlooked. For example, Okoye and Okechukwu (2021) focused on production efficiency and cost reduction, but did not examine the effect of Agile practices on innovation or employee satisfaction. Furthermore, Nwachukwu and Akinwale (2020) emphasized the impact of AID and AAP on project timelines and budget, yet the effect of Agile practices on customer satisfaction or market responsiveness was not considered. Expanding the range of performance variables in future studies would provide a more holistic view of how Agile methodologies influence organizational performance in Nigerian firms (Okoye & Okechukwu, 2021; Nwachukwu & Akinwale, 2020).

Methodological Gaps: The methodological approaches used in the reviewed studies also present certain limitations. Many studies, such as those by Nwachukwu and Akinwale (2020), and Akinbile and Adepoju (2022), utilized survey-based research designs, which, while effective in gathering large amounts of data, do not capture the nuances of Agile practices in practice. For instance, interviews or case studies that provide deeper insights into the challenges faced by firms during Agile implementation could complement survey data. Furthermore, while regression analysis was widely used, as seen in studies by Adedeji et al. (2020) and Okoye and Okechukwu (2021), there is limited use of more sophisticated analytical methods such as Structural Equation Modeling (SEM) or System Dynamics modeling that could capture the dynamic relationships between Agile practices and organizational performance over time. Future research could benefit from using mixed-methods approaches, combining quantitative data with qualitative insights to understand the broader organizational context of Agile adoption (Adedeji et al., 2020; Akinbile & Adepoju, 2022).

Geographical Gaps: A major gap in the empirical studies reviewed is the limited geographical scope, with most research focusing on urban areas such as Lagos and Abuja or specific sectors like IT and telecommunications. While studies like those by Okoye and Okechukwu (2021) and Adedeji et al. (2020) considered firms in major Nigerian cities, they did not explore how Agile methodologies might affect firms in rural or less industrialized regions of Nigeria. Additionally, the studies predominantly focus on specific industries, with limited exploration of sectors like agriculture, education, and energy, which could also benefit from Agile practices. Furthermore, there is a lack of comparative studies between Nigerian firms and firms in other African countries, which could provide a broader perspective on the effectiveness of Agile methodologies in different cultural and economic contexts. Future studies should aim to address these geographical gaps by including a wider range of Nigerian regions and industries, as well as conducting cross-country comparisons within the African continent (Adedeji et al., 2020; Okoye & Okechukwu, 2021).

Methodology

This study adopted a correlational research design to examine the relationship between Agile methodologies—Agile Iterative Development (AID), Agile Collaboration and Communication (ACC), Agile Adaptive Planning (AAP), and Agile Continuous Integration and Testing (ACIT)—and organizational performance (ORGP) in selected aluminum manufacturing firms in Delta State, Nigeria. The design enabled the researcher to determine the strength and direction of the relationships between these variables without manipulating them. The population comprised 1,200 employees drawn from four major aluminum firms: Delta Aluminum Limited (Warri), Sapphire Aluminum Industry (Asaba), Deltalux Aluminum Fabrication (Ughelli), and Universal Aluminum Company (Effurun). These firms were chosen due to their significance in the state's industrial landscape. Using the Taro Yamane formula, a sample size of 300 respondents was determined to ensure representativeness. A stratified random sampling technique was employed, dividing respondents into strata based on job roles (managers, production staff, and quality control officers) to ensure fair representation of all groups. Data were collected through a structured, self-administered questionnaire, which included two sections: Section A (demographics) and Section B (questions on Agile methodologies and performance). The instrument was designed using a 5-point Likert scale and distributed both physically and electronically. The validity of the instrument was ensured through expert review (content validity) and a pilot test involving 30 employees (construct validity),

after which necessary adjustments were made. The reliability of the instrument was confirmed through Cronbach's alpha, yielding coefficients ranging from 0.78 to 0.87, indicating strong internal consistency across all variables (AID = 0.82, ACC = 0.85, AAP = 0.78, ACIT = 0.80, ORGP = 0.87). For data analysis, both descriptive and inferential statistical techniques were employed. Descriptive statistics (means, frequencies, percentages, and standard deviations) summarized the data, while multiple regression analysis was used to determine the individual and combined effects of AID, ACC, AAP, and ACIT on organizational performance. The model specification was:

$ORGP = \beta_0 + \beta_1(AID) + \beta_2(ACC) + \beta_3(AAP) + \beta_4(ACIT) + \epsilon$
This analytical approach enabled the researcher to identify which Agile practices most significantly influenced organizational performance and to make data-driven recommendations for improving productivity and efficiency in Nigeria's aluminum manufacturing sector.

Variable	N	Mean	Std. Deviation	Interpretation*
AID (Agile Iterative Development)	255	3.98	0.72	Moderately high adoption
ACC (Agile Collaboration & Communication)	255	4.12	0.68	High adoption
AAP (Agile Adaptive Planning)	255	3.86	0.75	Moderate adoption
ACIT (Agile Continuous Integration & Testing)	255	4.25	0.61	High adoption
ORGP (Organizational Performance)	255	4.05	0.69	Above-average performance

*

Interpretation bands: 1.00–1.99 (low), 2.00–2.99 (moderate-low), 3.00–3.99 (moderate), 4.00–5.00 (high). Descriptives indicate that respondents report relatively strong uptake of collaboration practices and continuous integration/testing, with iterative development and adaptive planning present but slightly less pervasive.

Reliability check

Cronbach's alpha for each scale (computed in SPSS) indicated acceptable internal consistency:

- AID $\alpha = 0.78$
- ACC $\alpha = 0.83$
- AAP $\alpha = 0.76$
- ACIT $\alpha = 0.85$
- ORGP $\alpha = 0.81$

(These values indicate satisfactory scale reliability for multivariate analysis.)

Correlation analysis

Pearson correlations showed positive, significant relationships between all agile dimensions and

Analysis, Results and Discussion

Response rate and sample profile

A total of **300** questionnaires were distributed to managers and supervisory staff across selected aluminium manufacturing firms; 255 were returned and usable, yielding a response rate of 85.0%. Respondents represented production, engineering, quality, supply chain, and IT/operations units, giving a cross-functional perspective on agile implementation and organizational performance.

Descriptive statistics

Descriptive statistics (means and standard deviations) were computed in SPSS for the four agile constructs — Agile Iterative Development (AID), Agile Collaboration & Communication (ACC), Agile Adaptive Planning (AAP), Agile Continuous Integration & Testing (ACIT) — and the dependent variable Organizational Performance (ORGP).

organizational performance ($p < 0.01$). Correlation coefficients ranged approximately from $r = 0.45$ to $r = 0.63$, signalling moderate to strong associations and justifying regression analysis.

Regression analysis: effect of agile dimensions on organizational performance

A multiple linear regression was performed with ORGP as the dependent variable and the four agile constructs as independent predictors.

Model summary (SPSS-style):

- $R = 0.810$
- $R^2 = 0.656$
- Adjusted $R^2 = 0.649$
- $F(4, 250) = 116.30, p < 0.001$

This model suggests that 65.6% of the variance in organizational performance is explained collectively by the four agile variables — a substantial effect for organizational research.

Coefficients (standardized β , t, p):

Predictor	Std. Beta (β)	t	p
AID (Iterative Development)	0.212	4.83	< 0.001
ACC (Collab. & Comm.)	0.278	6.21	< 0.001
AAP (Adaptive Planning)	0.194	4.19	< 0.001
ACIT (Continuous Integration & Testing)	0.291	6.58	< 0.001

All four predictors are statistically significant ($p < 0.001$). **ACIT** (Continuous Integration & Testing) shows the largest standardized effect ($\beta = 0.291$), followed closely by **ACC** ($\beta = 0.278$), **AID** ($\beta = 0.212$) and **AAP** ($\beta = 0.194$).

Interpretation of quantitative findings

- **Continuous Integration & Testing (ACIT)** produces the strongest positive impact on organizational performance. This suggests that automated, continuous quality checks and rapid feedback loops materially improve product quality, reduce rework, and shorten lead times in aluminium manufacturing operations.
- **Collaboration & Communication (ACC)** is also a major driver. Firms reporting stronger cross-functional collaboration and transparent communication practices tend to exhibit higher performance metrics — likely via faster decision-making, fewer hand-off errors, and better alignment with customer requirements.
- **Iterative Development (AID)** contributes positively by enabling incremental improvements and faster learning cycles; this supports responsiveness to process and market demands.
- **Adaptive Planning (AAP)**, though slightly smaller in effect, remains significant: firms that flex plan and re-prioritise tasks respond better to operational variability (e.g., raw material supply fluctuations). Collectively, these results indicate that complementary agile practices — technical (CI/testing) and social/managerial (collaboration, iterative work, adaptive planning) — combine to drive superior organizational outcomes. In summary, aluminium manufacturing firms should strengthen digital agility through investment in automation, real-time systems, and integration tools; foster collaboration and adaptability by promoting open communication and iterative planning; build organisational capability through continuous training and committed leadership; and institutionalise regular performance evaluation to sustain continuous improvement and long-term competitiveness.

Discussion

The study's results substantiate the proposition that agile methodologies — when adapted for manufacturing contexts — have meaningful, measurable effects on organizational performance. The dominant effect of Continuous Integration & Testing resonates with literature that emphasises the importance of technical practices and automation in delivering consistent quality and shorter feedback loops. Likewise, the strong role of Collaboration & Communication aligns with research highlighting how social practices underpin agility's success.

The findings extend agile research beyond software development into heavy manufacturing, demonstrating that iterative work patterns, adaptive planning, and CI approaches can be successfully translated to physical production settings (e.g., by using short improvement cycles, digital checklists, and automated quality monitoring). The qualitative evidence highlights practical enablers (training, infrastructure, leadership support) and barriers (cultural resistance, legacy systems) that explain variation in adoption and outcomes.

Conclusion

This study investigated the impact of Agile Methodologies on the organizational performance of selected aluminium manufacturing firms in Delta State, Nigeria, using data from 255 valid responses out of 300 distributed questionnaires, complemented by managerial interviews. The empirical findings revealed that Agile Iterative Development (AID), Agile Collaboration and Communication (ACC), Agile Adaptive Planning (AAP), and Agile Continuous Integration and Testing (ACIT) all have significant and positive effects on organizational performance (ORGP).

Among the four dimensions, Agile Continuous Integration and Testing (ACIT) and Agile Collaboration and Communication (ACC) exhibited the strongest influence on performance outcomes, indicating that both technological and human-centric aspects of agility are crucial for operational success in manufacturing contexts. The results affirm that agile practices—originally rooted in software development—can be effectively adapted to manufacturing environments to enhance productivity, product quality, responsiveness, and overall competitiveness.

Qualitative insights further supported these results, highlighting improved process efficiency, faster problem resolution, and stronger team alignment as major outcomes of agile adoption. However, the study also identified practical challenges such as limited digital infrastructure, cultural resistance to change, and a need for greater training in agile principles.

In sum, the study concludes that the successful implementation of agile methodologies provides a strategic pathway for aluminium manufacturers to achieve superior organizational performance, provided that firms integrate both technical and collaborative agility, invest in human capacity development, and tailor practices to fit their production realities.

Recommendations

Based on the study's findings and conclusions, the following key recommendations are proposed:

- Invest in digital infrastructure, automation, and real-time feedback systems to enhance reliability, efficiency, and integration.

- ii. Promote open communication and adaptive planning through agile teamwork and iterative processes for continuous improvement.
- iii. Implement continuous training and leadership commitment to strengthen agility, digital skills, and organisational culture.
- iv. Establish performance dashboards and feedback systems to evaluate agile outcomes and sustain long-term innovation and competitiveness.

Publication Date: 2025/11/28

Abstract

This research investigated the impact of monetary policy on deposit money banks' performance in Nigeria: a post covid-19 analysis. The independent variables were monetary policy rate, cash reserve ratio, credit to private sector and digital banking transactions. The study used a monthly data ranging from January 2021 to December 2024 with net interest margin (NIM) as a measure of banks' performance (dependent variable). Data were analyzed using Error Correction Model (ECM). The results revealed that monetary policy rate exerted a strong and negative effect on bank performance, credit to the private sector also negatively influenced net interest margin of banks, contrary to theoretical expectations. Interestingly, the cash reserve ratio displayed a positive and significant relationship with bank performance while digital banking transactions, as expected, significantly improved banks' performance. The study concluded that while conventional monetary policy tools like MPR and CRR exert strong influences on bank performance, the resilience of Nigerian banks in the post-COVID era has increasingly depended on technological innovation and strategic adjustments. It is recommended that the Central Bank of Nigeria should avoid prolonged reliance on high monetary policy rates, make cash reserve ratio to be more flexible to avoid crowding out private sector lending and encourage continued investment in digital banking platforms to enhance banks' performance in the post-covid-19 period.

Key words: Banks Performance, Credit to Private Sector, Error Correction Model, Monetary Policy Rate, Net Interest Margin

Introduction and Background to the Study

The role of monetary policy in shaping the performance and stability of banks has long been recognized in financial economics. In Nigeria, the conduct of monetary policy which is anchored primarily on instruments such as the monetary policy rate, cash reserve ratio, and credit allocation policies remains central to the performance of deposit money banks, particularly in the aftermath of major economic shocks. The COVID-19 pandemic of 2020 constituted one of the most disruptive episodes in modern economic history, triggering contractions in global output, trade flows, and financial markets. Nigeria's economy, heavily dependent on oil revenues, was severely hit as crude prices plummeted, leading to a 1.92% contraction in GDP in 2020, while inflation surged to over 15% (National Bureau of Statistics, 2021).

During this crisis, Nigerian banks faced dual challenges: declining asset quality from non-performing loans and shrinking net interest margins as monetary authorities attempted to stimulate growth with accommodative policies. For instance, the Central Bank of Nigeria (CBN) slashed the

monetary policy rate to 11.5% in September 2020, the lowest in four years, in a bid to stimulate credit expansion to the private sector (CBN, 2020). Consequently, credit to the private sector as a percentage of GDP rose from 12.1% in 2019 to 14.2% by 2021, reflecting the CBN's push for financial intermediation despite systemic risks (Gbarawae & Chinaka, 2024). Yet, while increased lending supported short-term liquidity, it also heightened exposure to credit risk, which weighed heavily on bank performance. Recent studies such as Ozili (2025), Andabai and Oyakegha (2025), Ebinum (2025) confirm that increased cash reserve ratio such as the unprecedented 32.5% ratio imposed in 2023 posed a serious constraint to banks' capacity to intermediate funds profitably, thereby squeezing net interest margins. This was particularly problematic for smaller banks whose performance relies significantly on interest spreads (Erhijakpor, 2025). Simultaneously, the period after COVID-19 witnessed an unprecedented acceleration in digital financial services in Nigeria. With lockdowns and social distancing fueling demand for online and mobile transactions, digital banking volumes surged.

By 2022, electronic payment transactions in Nigeria exceeded ₦500 trillion, marking a 42% year-on-year increase (NIBSS, 2022). This structural shift introduced new dynamics into bank performance: while transaction fees and efficiency gains boosted revenues, the capital expenditure on digital infrastructure and cybersecurity posed fresh challenges (Nwala, Gimba & Ukachukwu, 2024). Empirical evidence shows that digital banking adoption significantly altered the revenue mix of Nigerian banks, reducing their reliance on traditional interest-based income while diversifying toward fee-based and digital services (Taiwo & Akande, 2024). In effect, monetary policy in the post-pandemic period has operated alongside the digitalization wave, jointly shaping performance outcomes in ways that are both complex and unprecedented.

The Nigerian banking sector operates at the intersection of monetary policy decisions and rapidly evolving financial technologies. In the aftermath of the COVID-19 pandemic, the Central Bank of Nigeria adopted a mix of accommodative and contractionary policies cutting the Monetary Policy Rate (MPR) to historic lows in 2020 before tightening rates and raising the cash reserve ratio to 32.5% by 2023 (CBN, 2024). While these measures were aimed at stabilizing inflation, stimulating credit to the private sector, and ensuring financial stability, their direct impact on bank performance remains unclear. At the same time, the surge in digital banking transactions, which exceeded ₦500 trillion in 2022, has altered banks' revenue models, reducing reliance on traditional interest spreads while increasing fee-based income. This structural shift raises critical questions about whether monetary policy tools such as monetary policy rate, cash reserve ratio and credit expansion still significantly shape net interest margins (NIM) in the post-pandemic era, or whether digital banking has redefined performance dynamics.

Again, despite the strategic importance of banks to Nigeria's economic recovery and financial stability, few empirical studies have investigated how monetary policy affects bank performance in the unique context of 2020–2024, when both macroeconomic volatility and digital disruption converged. Given the evolving financial landscape in Nigeria, understanding the nexus between monetary policy tools such as monetary policy rate, cash reserve ratio, credit to the private sector and bank performance indicators like Net Interest Margin (NIM), particularly under the influence of digital banking, has become not only timely but essential. While some studies have explored bank performance during the COVID-19 shock, there remains a paucity of empirical work that situates the analysis squarely in the post-pandemic Nigerian context (2020–2024), a period marked by inflationary pressures, currency devaluations, and rapid financial technology adoption (Michael *et al.*, 2025).

This study, therefore, contributes to the literature by examining how monetary policy has influenced the performance of deposit money banks in Nigeria after the COVID-19 pandemic, focusing specifically on the interplay between traditional monetary tools and the rise of digital banking. This gap in knowledge underscores the need to systematically examine the impact of monetary policy instruments and digital banking on the performance of Nigerian deposit money banks. The main objective is to analyze the impact of monetary policy on the performance of banks in Nigeria in the period after the covid-19 which is from 2020 to 2024. Specifically, the study intends to:

1. Investigate the relationship between monetary policy rate and net interest margin of deposit money banks in Nigeria;
2. Analyze the impact of credit to private sector (% of GDP) on net interest margin of deposit money banks;
3. Determine the relationship between cash reserve ratio and net interest margin of deposit money banks;
4. Ascertain the impact of digital banking transactions on net interest margin of deposit money banks in Nigeria.

The study focuses on all deposit money banks in Nigeria due to the availability of data from the Central Bank of Nigeria. The hypotheses to be tested are stated in their null forms as follows:

- H₀₁: There is no significant relationship between monetary policy rate and net interest margin of deposit money banks in Nigeria.
- H₀₂: There is no significant relationship between credit to private sector (% of GDP) and net interest margin of deposit money banks.
- H₀₃: Cash reserve ratio has no significant relationship with net interest margin of deposit money banks.
- H₀₄: Digital banking transactions have no significant relationship with net interest margin of deposit money banks in Nigeria.

These hypotheses are justified based on the fact that theoretical expectations and empirical findings linking monetary policy to banks' performance are not conclusive, making it necessary to statistically test whether significant relationships exist in the Nigerian context during the post-COVID period (2020–2024).

Literature Review

The literature review focuses on detailed discussion of the key concepts of the study which include the monetary policy variables viz: monetary policy rate, credit to private sector, cash reserve ratio, digital banking transactions, and performance of banks. The conceptual review is followed by the theoretical review which delves into relevant theories that explain the interaction between monetary policy and banks performance. The literature also includes the

empirical review which is a review of previous studies from where gaps in literature are identified.

Conceptual Review

The COVID-19 pandemic significantly disrupted Nigeria's financial sector, prompting the Central Bank of Nigeria (CBN) to implement monetary policy tools to maintain financial stability. In the post-COVID era (2020 till date), these policy instruments directly shaped the performance of deposit money banks through their influence on liquidity, lending, and performance. Monetary policy rate is the benchmark interest rate set by a country's central bank to influence lending, borrowing, and overall economic activity (Ajayi & Nwakanma, 2023). In the immediate post-COVID period, the CBN reduced the MPR to 11.5% particularly in September 2020 to encourage lending and support economic recovery. However, persistent inflationary pressures led to consecutive increases from May 2022, reaching 18.75% by 2023. This tightening cycle, according to Ajayi and Nwakanma (2023), increased borrowing costs, affecting bank lending volumes and performance. Banks, in response, adjusted lending rates and restructured credit allocation thereby affecting their financial performance indicators.

In Nigeria, credit to private sector is vital for stimulating investment and growth, yet it remains sensitive to monetary policy shifts. According to Ofori *et al.* (2022), credit to private sector refers to financial resources made available to businesses and households by financial institutions. During the pandemic recovery, the CBN launched targeted credit interventions (e.g., the ₦50 billion COVID-19 stimulus fund and agriculture/SME support facilities) to sustain private sector activity. Although higher monetary policy rate constrained new lending, directed credit schemes expanded private sector credits, showing a divergence between policy tightening and developmental finance efforts. This duality highlights the complex role of private sector credit in linking monetary policy with bank performance.

By way of conceptualization, Ekeocha, Chukwu, and Ibrahim (2021) noted that cash reserve ratio is the mandatory proportion of commercial bank deposits that must be kept with the Central Bank of Nigeria (CBN). Nigeria maintained one of the world's highest cash reserve ratio at about 32.5% in 2023 and this rate severely constrain banks' liquidity. The tightening of cash reserve ratio was aimed at mopping up excess liquidity to combat inflation; it has the capacity to reduce banks' capacity to extend credit profitably (Ekeocha *et al.*, 2021).

Ozili (2020) observed that the financial transactions executed through digital platforms such as mobile apps, internet banking, and USSD systems make what we refer to as digital banking transactions. After the pandemic in 2020, digital banking

transactions surged and Obaidullah and Haq (2024) observed that the surge cushioned the negative effects of tight monetary policy, boosting fee-based income and operational efficiency while deepening financial inclusion.

Net interest margin is used as a measure of bank performance in this study because it is a reflection of how banks balance policy-induced constraints with innovative business models. NIM is the difference between interest income earned on loans and the interest paid on deposits relative to interest-earning assets (Mulyaningsih & Sastrosuwito, 2021). On one hand, high monetary policy rate and cash reserve ratio reduced lending opportunities and increased the cost of funds. On the other hand, increased reliance on digital channels, non-interest income, and CBN's intervention loans provided relief (Adewuyi & Babajide, 2023).

Theoretical Review

This study is anchored on two theories namely: Market Power Theory of Interest Margins and Financial Intermediation Theory. The market power theory originates from the Structure-Conduct-Performance (SCP) paradigm in industrial organization economics (Mason, 1939; Bain, 1951). It was later applied to banking by scholars such as Ho and Saunders (1981), who examined determinants of banks' net interest margins. The theory holds that banks with greater market power, i.e. larger market share or less competition are able to set higher loan rates and lower deposit rates, thereby widening their net interest margins. Essentially, profitability is sustained not just by efficiency but by the ability to influence pricing in the market. Conversely, in highly competitive markets, net interest margins tend to be compressed as banks compete for both deposits and lending opportunities. Therefore, in competitive and regulated environments like Nigeria, tight monetary policy compresses margins and this explains why Nigerian banks turned to digital banking and non-interest income to stabilize profitability in the post-COVID period (Nyarko-Baasi *et al.*, 2024). Intuitively, larger banks with stronger market power can still maintain relatively stable margins by leveraging their market dominance, digital banking platforms, and diversified income sources. Thus, the market power theory explains why banks' performance outcomes differed under the same monetary policy environment since those with greater market power could better withstand the policy shocks, while smaller banks were more vulnerable.

Going further, the financial intermediation theory argues that banks exist to channel funds from surplus units (depositors) to deficit units (borrowers), improving resource allocation efficiency (Gurley & Shaw, 1960; Goldsmith, 1969) and McKinnon, 1973). However, regulatory tools such as the cash reserve ratio directly influence banks' ability to perform this

role in the Nigerian context. Also, high cash reserve ratio can limit banks' lending capacity, supporting the theory's assertion that monetary policy significantly constrains intermediation efficiency (Ekeocha *et al.*, 2021). On the other hand, CBN's intervention facilities can strengthen intermediation during economic recovery likewise digital banking adoption.

These two theories provide a framework for understanding how monetary policy shapes bank performance. While the financial intermediation theory highlights the systemic role of banks in channeling credit to the economy, the market power theory explains differences in how individual banks withstand monetary shocks. Thus, in post-COVID Nigeria, banks' performance depended both on the constraints of monetary policy and on their ability to leverage market power and digital innovation to sustain profitability.

Empirical Review

Ebinum (2025) investigated the impact of interest rates on the financial performance of deposit money banks in Nigeria using panel regression (1991–2024). The study considered interest rates, monetary policy rate (MPR), and net interest margin (NIM), finding that frequent hikes in MPR significantly compressed banks' interest spreads, concluding that restrictive monetary policies weaken profitability. Similarly, Andabai (2025) examined monetary policy and commercial banks' performance in Nigeria with data from 2000–2024, employing time series regression. Results revealed that MPR strongly predicts variations in NIM and return on equity, implying that monetary tightening worsens margins. Likewise, Olumuyinwa and Faithwin (2025) studied monetary policy instruments and financial performance of Nigerian deposit money banks (2015–2024) using panel fixed effects. They found that while liquidity ratio and MPR negatively influenced net interest margin, credit to the private sector had a positive impact, suggesting that credit expansion enhances profitability.

Ogbulu and Ejem (2024) analyzed determinants of interest rate spread in Nigeria (1991–2020) via vector error correction models. Their findings confirmed that monetary policy rate and inflation widen spreads while reducing net margins, highlighting the adverse effect of interest rate volatility. Nwaguru and Felix (2025) examined interest rate deregulation and non-performing loans in Nigeria using time-series regression. Their analysis linked monetary policy rate (MPR) hikes with higher credit risk and compressed net interest margins (NIM), concluding that interest rate liberalization without stability measures worsens bank profitability.

Oji and Odi (2024) conducted a time-variant study on monetary policy and net domestic credit in Nigeria using ARDL models. They found that MPR and cash reserve ratio (CRR) shocks negatively affect private

sector credit, but expanding credit lines improves net interest margin, suggesting banks profit when credit-to-GDP ratios rise. Michael, Jeremiah, and Akpabio (2025) studied banking regulation and performance of banks in Nigeria (2008–2022) through an ex-post facto design. Results showed that CRR and liquidity ratio strongly constrain banks' profitability, with CRR in particular crowding out lending and depressing NIM. Similarly, Anisiuba and Olelewe (2025) linked CRR tightening between 2022 and 2024 to declining bank credit, emphasizing its contractionary role.

Extending the discourse, Aliyu *et al.* (2024) explored macro-prudential and monetary policy effects on Nigerian banking sector performance using ex-post facto design with secondary data. They discovered that credit to the private sector as a share of GDP positively correlates with banks' performance, emphasizing credit allocation as a growth channel. In contrast, Ezie and Oniore (2024) assessed transmission of monetary policy shocks on non-performing loans in Nigeria using vector autoregression (VAR). They found that tighter MPR increased loan defaults, indirectly reducing banks' net margins, stressing the need for policy balance.

Focusing on liquidity constraints, Ozili (2025) argued that the 32.5% cash reserve ratio imposed in 2023 severely squeezed banks' lending ability, lowering net margins. Complementarily, Nduka and Ngangah (2024) analyzed the effect of monetary policy on the Nigerian banking sector (1981–2023) using ARDL models. They concluded that while CRR ensures stability, excessively high ratios curtail performance. Adamgbo *et al.* (2023) investigated the influence of monetary policy on commercial banks in Nigeria under monetarist ideology. Applying OLS on post-COVID data, they confirmed that digital banking transactions significantly boosted efficiency and widened net margins, offsetting losses from restrictive policy tools.

Iyoha (2024) investigated electronic banking channels and financial performance in the Nigerian banking industry using panel regression from 2015–2022. The study confirmed that e-banking significantly improved the performance of banks by reducing transaction costs and broadening customer reach. Hassan and Bassey (2025) found that digital banking positively affected financial performance of listed Nigerian banks, noting that digital platforms mitigate the negative effects of monetary tightening.

Gap in Literature

Although a growing body of research has examined the influence of monetary policy instruments on bank performance in Nigeria, significant gaps remain. Most existing studies (such as Ebinum, 2025; Andabai, 2025; Ozili, 2025) focused on broad performance indicators such as return on assets (ROA) and return on equity (ROE), with limited

emphasis on net interest margin (NIM) as a direct measure of intermediation efficiency.

Furthermore, while recent works have analyzed monetary policy rate and cash reserve ratio, fewer have jointly incorporated credit to the private sector and the rapidly expanding digital banking transactions into a single framework. In particular, studies on digital banking have concentrated on operational efficiency without linking it directly to monetary policy effects on net interest margin.

Another gap lies in the post-COVID-19 period (2020–2024), which introduced unprecedented monetary tightening (e.g., 32.5% cash reserve ratio in 2023) alongside rapid digital transformation, yet very few empirical investigations have addressed how these simultaneous shifts shape banks' performance. This study therefore fills the gap by providing a holistic, post-pandemic analysis of how monetary policy rate, cash reserve ratio, credit to private sector, and digital banking interact to influence the net interest margin of Nigerian deposit money banks.

Methodology

This research adopts an *ex-post facto* research design, since it relies on secondary time-series data already published and cannot be manipulated by the researcher. The study uses monthly secondary data covering the period January 2021 to December 2024. Data for monetary policy rate, cash reserve ratio and credit to the private sector were obtained from Central Bank of Nigeria (CBN) Statistical Bulletin & Monetary Policy Communiqués and National Bureau of Statistics (NBS). Data for digital banking transactions were obtained from the Nigeria Inter-Bank Settlement System (NIBSS) while data for and net interest margin was obtained from Nigeria Deposit Insurance Commission (NDIC) Quarterly Financial Performance Report for the relevant years. The study employed time-series econometric techniques in analyzing the data. These include stationarity test which was used to check unit roots in the monthly data. Johansen Co-integration test determined the existence of long-run relationships among the variables, while the Error Correction Model (ECM) estimated the short-run dynamics of the variables. Diagnostic tests were carried out and they include Breusch-Godfrey test for autocorrelation, heteroskedasticity (White test), and model stability (CUSUM).

Model Specification

Table 1: Summary of the Unit Root Test (*p*-values in parenthesis)

Variables	ADF test stat.	ADF test stat.	Order of Integration
@Level	@First Difference		
NIM	-1.5847 [0.4820]	-3.7186 [0.0069]	Stationary at first difference, I(1)
MPR	-1.6928 [0.4283]	-3.9023 [0.0042]	Stationary at first difference, I(1)
CRR	0.5738 [0.9874]	-4.1288 [0.0463]	Stationary at first difference, I(1)

The model flows from the financial intermediation theory, which links monetary policy to credit allocation and bank performance, and the market power theory, which explains variations in banks' interest margins under monetary policy shocks. The specification modifies the work of Olumuyinwa and Faithwin (2025) who used liquidity ratio, MPR and credit to the private sector as constructs of monetary policy while net interest margin was their dependent variable. By way of modification, we introduce digital banking transaction in addition to the monetary policy variables in order to add currency to the variables.

The functional form of the model is:

$$NIM_t = f(MPR_t, CRR_t, CPS_t, DBT_t) \quad (1)$$

Where:

NIM = Net Interest Margin of banks (proxy for performance)

MPR = Monetary Policy Rate

CRR = Cash Reserve Ratio

CPS = Credit to the Private Sector

DBT = Digital Banking Transactions

The econometric form of the model is specified as:

$$NIM_t = \alpha_0 + \beta_1 MPR_t + \beta_2 CRR_t + \beta_3 CPS_t + \beta_4 DBT_t + \varepsilon_t \quad (2)$$

Where ' ε_t ' is the error term, α_0 is the intercept of the model, β_1 – β_4 are the coefficients of the model to be estimated and 't' is the time period (2021:M01 to 2024:M12).

Apriori Expectations

Based on theory and prior empirical findings:

$\beta_1 < 0$: MPR is expected to be negative meaning that higher MPR increases lending rates, discouraging credit and reducing net interest margin of banks.

$\beta_2 < 0$: CRR is expected to be negative which implies that higher CRR reduces banks' liquidity and lending capacity, compressing net interest margin of banks.

$\beta_3 > 0$: CPS is expected to be positive meaning that increased credit to the private sector should enhance banks' earnings and performance.

$\beta_4 > 0$: DBT is expected to be positive which means more digital banking transactions increase fee-based income and efficiency, boosting net interest margin of banks.

Data Analysis

The analyses start with the test for unit root on each of the variables in order to ascertain their suitability for the forecast. This was followed by the Cointegration test and the model estimation.

CPS	-0.6459 [0.8499]	-3.5411 [0.0111]	Stationary at first difference, I(1)
DBT	-1.7449 [0.4025]	-5.9399 [0.0117]	Stationary at first difference, I(1)

The unit root test is premised on the following null and alternate hypothesis:

H₀: The variable has a unit root (i.e. it is not stationary)

H₁: The variable has no unit root (i.e. it is stationary)
Since the probability values of the ADF test statistic at first difference are all less than 0.05 critical value,

we reject their respective null hypothesis and conclude that the variables have no unit root (i.e. they are stationary at first difference. Thus the statistical properties of the variables at first difference do not vary with time and so the first differenced data can be used in our estimation without the result being spurious. We proceed with the test for long run association amongst the variables.

Table 2: Summary of the Johansen Cointegration Test

Hypothesized No. of CE(s)	Trace Statistic	Prob.**	Max-Eigen Statistic	Prob.**	Decision
None *	1387.888	0.0000	588.4145	0.0001	Cointegrated
At most 1 *	799.4732	0.0001	381.1963	0.0001	Cointegrated
At most 2 *	418.2768	0.0001	270.8718	0.0001	Cointegrated
At most 3 *	147.4050	0.0001	124.4586	0.0001	Cointegrated
At most 4 *	22.94647	0.0031	17.24166	0.0164	Cointegrated
At most 5 *	5.704806	0.0169	5.704806	0.0169	Cointegrated

The null and alternate hypothesis for the Johansen cointegration test is stated below:

H₀: The variables are not cointegrated

H₁: The variables are cointegrated

The Johansen cointegration test uses both the trace statistic and the Max-eigen statistic to determine the presence of long run relationship amongst variables. In Table 2, the Trace and max-eigen statistics have

significant probability values which imply that the null hypothesis is rejected. Thus, the test concludes that the variables are cointegrated i.e. there is long run relationship between monetary policy variables and bank performance. Since the study has found the variables to be integrated at first difference I(1) and cointegrated, the model parameters are estimated using the Error Correction Mode

Table 3: Summary of the Error Correction Model

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-6.512176	4.738489	-1.374315	0.1774
MPR	-6.391958	1.138845	-5.612668	0.0000
CRR	7.069078	0.911112	7.758737	0.0000
CPS	-42.38415	4.938276	-8.582783	0.0000
DBT	31.75194	4.022242	7.894090	0.0000
ECM(-1)	-0.773246	0.249441	-3.099915	0.0087
R-squared	0.989287	F-statistic		70.18228
Adjusted R-squared	0.987877	Prob(F-statistic)		0.000000
		Durbin-Watson		
S.E. of regression	0.035681stat			1.767087

Table 3 shows that the coefficient of monetary policy rate (MPR) is negative and highly significant. This means that an increase in monetary policy rate reduces banks' net interest margin (NIM). This aligns with theory and a-priori expectation where higher MPR raises lending costs, reduces loan demand, and compresses margins.

Cash reserve ratio (CRR) has a positive and significant coefficient. This means that higher cash reserve ratio appears to increase banks' performance in this model, which may reflect Nigerian banks' ability to pass liquidity costs to borrowers or compensate through non-interest income. This

finding is interesting and may reflect Nigeria's unique regulatory environment as will be discussed later.

The coefficient of credit to private sector (CPS) is negative and significant which means that credit to private sector reduces net interest margin of banks.

This could mean that while banks extend more loans, the profitability of those loans is limited by high defaults, rising risks, or lower effective yields.

The coefficient of digital banking transactions (DBT) is positive and significant. This is an indication that digital banking transactions strongly boost bank

performance. This shows that digitalization cushioned policy tightening effects by improving efficiency, lowering costs, and expanding fee-based income.

The coefficient of the error correction term ECM(-1) is negative and significant and this confirms a valid error-correction mechanism. About 77% of short-run

disequilibrium is corrected each month, showing strong convergence to long-run equilibrium. Since the intercept of the model is negative and not statistically significant, the baseline effect of omitted variables is negligible. The F-statistic is significant ($p=0.000$) and this implies that the overall model is highly significant.

Table 4: Diagnostic Tests

Test	Test statistic	Decision
Breusch-Godfrey Serial Correlation LM Test	F-statistic = 1.7391 ($p=0.4578$)	No serial correlation is present
Heteroskedasticity Test: White	F-statistic = 0.045 ($p=0.6109$)	Accepts homoskedasticity assumption
R-squared	0.9893 (98.93%)	
Stability Test (CUSUM)	Within 5% bounds	Model is stable

The diagnostic test summarized in Table 4 shows that the model explains about 98.93% of variations in bank performance which is an excellent explanatory power. No significant serial correlation is present since the probability value is greater than 0.05

Figure 1: CUSUM Test

The CUSUM line remains within the 5% significance boundaries which is an indication that the model is stable over time. This means the relationships

Figure 2: Actual and Fitted Regression Plot

The actual and fitted values closely align, confirming the model's high predictive accuracy (consistent with $R^2 \approx 0.99$). The indication is that the deviations are minimal, showing the ECM captures the dynamics of banks' performance effectively.

Test of Hypotheses:

The hypothesis test is shown in a Table in order to summarize the test and show the significance or otherwise of the variables at a glance.

identified are not spurious and the ECM is structurally reliable.

Table 5: Summary of the Hypotheses Test

Hypotheses	t-statistic	Decision
There is no significant relationship between monetary policy rate and net interest margin of deposit money banks in Nigeria.	-5.6127 <i>p-value</i> = 0.0000	Reject H ₀₁ since <i>p-value</i> is less than 0.05 critical value
There is no significant relationship between credit to private sector (% of GDP) and net interest margin of deposit money banks.	7.7587 <i>p-value</i> = 0.0000	Reject H ₀₂ since <i>p-value</i> is less than 0.05 critical value
Cash reserve ratio has no significant relationship with net interest margin of deposit money banks.	-8.5828 <i>p-value</i> = 0.0000	Reject H ₀₃ since <i>p-value</i> is less than 0.05 critical value
Digital banking transactions have no significant relationship with net interest margin of deposit money banks in Nigeria.	7.8941 <i>p-value</i> = 0.0000	Reject H ₀₄ since <i>p-value</i> is less than 0.05 critical value

The first hypotheses test revealed that MPR has a significant negative effect on net interest margin of banks. Thus, increases in MPR reduce bank performance in Nigeria. From the second hypothesis, credit to private sector (CPS) significantly influences net interest margin of banks, but the relationship is negative. This suggests that while banks extend credit, profitability is reduced, possibly due to rising default risks or low lending efficiency in Nigeria's post-COVID environment.

For the third hypothesis, the study concludes that cash reserve ratio (CRR) significantly affects net interest margin of banks, with a positive relationship in this model. This indicates that despite liquidity constraints from high CRR, Nigerian banks may be compensating by repricing loans, raising fees, or leveraging other income channels to sustain margins.

The fourth hypothesis concluded that digital banking transaction (DBT) has a strong positive and significant impact on net interest margin of banks. This confirms that digital banking adoption in the post-COVID period enhanced efficiency, expanded fee-based income, and supported profitability despite monetary tightening.

Discussion of Findings

The study revealed that the monetary policy rate (MPR) exerts a significant negative effect on the net interest margin (NIM) of deposit money banks. This suggests that frequent hikes in MPR raise the cost of borrowing, discourage loan uptake, and compress banks' margins. The result is intuitive, as restrictive monetary policies often discourage credit expansion and reduce profitability in economies with fragile credit markets. This finding is consistent with Ebinum (2025) and Andabai (2025), who both reported that persistent monetary tightening reduced bank spreads and weakened profitability. Similarly, Ogbulu and Ejem (2024) and Nwaguru and Felix (2025) observed that rising MPR leads to higher credit risk, narrowing banks' margins. Thus, the result reaffirms the

theoretical expectation that restrictive monetary policy undermines banks' financial performance.

Contrary to theoretical expectations, credit to the private sector (CPS) was found to have a negative and significant relationship with net interest margin. This implies that while banks expanded credit, their profitability did not improve; instead, margins were eroded. A plausible explanation lies in Nigeria's post-COVID environment, where inflationary pressures, exchange rate volatility, and high default risks limited the profitability of loans extended to the private sector. Although this contrasts with the findings of Olumuyinwa and Faithwin (2025) and Aliyu et al. (2024), who argued that credit expansion enhances profitability, it aligns with the concerns of Nwaguru and Felix (2025) that increased lending under unstable monetary conditions worsens non-performing loans and reduces margins. The divergence highlights how macroeconomic instability can overturn the expected growth-enhancing role of private sector credit.

Interestingly, the study found that the cash reserve ratio (CRR) has a positive and significant effect on net interest margin. Theoretically, a high CRR should reduce bank liquidity and constrain lending, thereby depressing profitability. However, in Nigeria's case, banks appear to have adapted to the high CRR regime (32.5% in 2023) by repricing loans, passing on costs to borrowers, and relying on fee-based income or service revenue from digital services. This adaptive behavior enabled banks to sustain margins despite liquidity constraints. The finding diverges from Michael, Jeremiah, and Akpabio (2025), Ozili (2025), and Anisiuba and Odelewe (2025), who all found that CRR tightening reduces bank profitability by crowding out lending. Nonetheless, the divergence underscores the resilience and innovation of Nigerian banks, which have developed mechanisms to mitigate the adverse effects of restrictive policy instruments.

The study also established a strong positive relationship between digital banking transactions (DBT)

and net interest margin. This indicates that the adoption of digital platforms significantly enhanced banks' efficiency, lowered transaction costs, and expanded fee-based income, thereby offsetting the negative impact of monetary tightening. This result is consistent with Adamgbo et al. (2023), who showed that digital banking boosted efficiency and widened margins, and Iyoha (2024), who found that electronic banking reduced costs and broadened customer reach. Similarly, Hassan and Bassey (2025) demonstrated that digital platforms cushioned banks against the profitability pressures of restrictive monetary policies. The monetary policy variables used in the study were jointly significant in determining overall banks' performance while also accounting for high proportion of changes in banks' net interest margin.

Conclusion and Recommendations

The study concludes that while conventional monetary policy tools like monetary policy rate and cash reserve requirement exert strong influences on bank performance, the resilience of Nigerian banks in the post-COVID era has increasingly depended on technological innovation and strategic adjustments. The monetary policy remains a powerful determinant of banking performance in Nigeria, but its effects can either weaken or strengthen profitability depending on the policy mix, economic environment, and the strategic responses of banks. While traditional tools such as MPR and CRR remain central to liquidity management, their effectiveness in enhancing bank profitability is limited in a volatile, post-pandemic economy. Instead, the resilience of Nigerian banks has increasingly been tied to technological innovation and income diversification. It is recommended that:

1. The Central bank of Nigeria (CBN) should avoid prolonged reliance on high monetary policy rates, as these restrict credit expansion and erode bank profitability. Instead, a more balanced approach that combines inflation control with growth-supportive policies is essential.
2. While cash reserve ratio serves as a liquidity control tool, excessively high ratios undermine intermediation. The CBN should consider moderating the cash reserve ratio or making it more flexible, to avoid crowding out private sector lending.
3. Since credit to private sector negatively affected margins, banks should strengthen risk assessment frameworks, adopt more stringent loan monitoring mechanisms, and diversify credit portfolios to minimize defaults and improve the profitability of lending.
4. Policymakers should encourage continued investment in digital banking platforms, cybersecurity, and financial inclusion initiatives.

Given the positive effect of digital banking transactions, banks should scale up digital innovations as a sustainable source of income and efficiency. Also, banks in Nigeria should reduce over-reliance on interest income by expanding fee-based services, trade finance, and digital products, which have shown resilience under monetary tightening.

Information Technology Infrastructure And Sustainability Of Virtual Organizations In Port Harcourt, Rivers State

ELEKWACHI, Happiness Nwanyi

Department of Office and Information Management,
River State University of Science and Tech, Portharcourt.
email: happiness.elekwachi@ust.edu.ng

Publication Date: 2025/11/28

Abstract

The purpose of the study was to unravel the relationship between information technology infrastructure and sustainability of virtual organizations in Port Harcourt, Rivers state. The study population was made up of leaders of functional and operational virtual organizations in Port Harcourt. The study argued that application, network, database, and warehouse enhance the sustainability of virtual organizations in Port Harcourt. Primary data was collected using structured questionnaires from one hundred and thirty-six (136) leaders who were conveniently selected from regional offices and branches of the 12 functional and operational virtual organizations in Port Harcourt, Rivers State. Data was analyzed using the Spearman Rank Order of Correlation Coefficient with the help of SPSS version 23.00. The study found out that there is a positive and significant relationship between information technology infrastructure and sustainability. From the findings made, the study therefore, recommends that; the leadership of virtual organizations should adopt the tested attributes of information technology infrastructure so as to drive the sustainability of virtual organizations in Port Harcourt.

Introduction

Information technology (IT) infrastructure and sustainability of virtual organizations typically delves into the intersection of technology, organizational structure, and environmental concerns. One notable study by Stankovic et al. (2018) explored the relationship between IT infrastructure and sustainability in virtual organizations. The authors emphasized the importance of robust digital infrastructure, including network systems and cyber security measures, in supporting the sustainability goals of virtual organizations.

The business landscape of today requires new and innovated applications in the areas of marketing, manufacturing, and customer service to meet growing customers' demands. As organizations strive for competitive advantages with their applications, the concepts of "time to market" and "flexibility" has become significant attributes. This new business

environment has produced concepts such as campaign management systems (CMS) for marketing, supply chain management (SCM) for manufacturing, and customer relationship management (CRM) for customer service. CMS may be viewed as a marketing system that assists in the planning, product/service definition, scheduling, and execution of a marketing campaign. SCM is often viewed as the support system to aid manufacturing in the efficient production and delivery of goods. CRM can be defined as a technological mechanism used to enhance the customer's relationship with an organization. While all of these relatively new managerial system tools are technologically based, they seem to have a single inherent quality, that of flexibility. That flexibility is believed to be the basis of a competitive advantage. But the concept of flexibility that many of these applications are built upon is not new, and actually evolved from old concepts.

Gupta, et al. (2022) examines the impact of emerging technologies such as blockchain and IoT on the sustainability of virtual organizations, exploring how these innovations can improve transparency, efficiency, and environmental performance. Research on the information technology (IT) infrastructure and sustainability of virtual organizations has gained significant attention in recent years. Virtual

organizations, defined as entities that operate primarily through digital platforms and remote collaboration, rely heavily on IT infrastructure to sustain their operations and achieve long-term viability. According to David (1996), a virtual organization is a network of independent entities, often geographically dispersed, that collaborate via electronic means to achieve common goals. The competitive, global nature of business and the

development of robust telecommunication network technology have led organizations to design new business processes for organizing work to maintain a competitive advantage. Specifically, organizations have begun using virtual teams as a solution to optimizing dispersed resources. Virtual teams are geographically dispersed groups of people linked together by a common purpose and advanced computer and telecommunication technologies. This organizational design provides optimum teaming of world-class competencies by linking together employees who might not otherwise be available to work together. Similarly, Hilty et al. (2019) conducted research on the environmental sustainability aspect of IT infrastructure in virtual organizations. They highlighted the potential environmental impacts of digital technologies and proposed strategies for reducing carbon footprints through efficient IT management practices.

Furthermore, Kagermann et al. (2019) examined the role of IT infrastructure in enabling agile and resilient virtual organizations. They emphasized the need for flexible IT systems that can adapt to changing business environments while maintaining sustainability goals. Overall, these studies underscore the critical role of IT infrastructure in supporting the sustainability and resilience of virtual organizations in Port Harcourt, providing valuable insights for practitioners and policymakers alike. These studies collectively contribute to understanding how IT infrastructure can support the sustainability objectives of virtual organizations in Port Harcourt, providing insights into technological innovations, management strategies, and environmental considerations.

Statement of the problem

Information technology (IT) infrastructure and sustainability of virtual organizations typically addresses the challenges and gaps in achieving sustainable operations within virtual settings. In the context of virtual organizations, there is a pressing need to understand and address the intricate interplay between information technology infrastructure and sustainability. Despite the significant advantages of digital operations, virtual organizations face challenges in ensuring the long-term sustainability of their IT infrastructure. The current lack of comprehensive frameworks and strategies tailored to the unique requirements of virtual organizations hinders their ability to effectively manage and mitigate these challenges, potentially impeding their sustainability objectives. Another challenge is ensuring a reliable internet connection. Since virtual organizations heavily rely on the internet for communication and collaboration, any disruptions in connectivity can impact productivity. Another challenge is managing cybersecurity risks. Virtual organizations need to stay vigilant and implement robust security measures to protect sensitive data and prevent cyber attacks. Additionally, keeping up with technological advancements and regularly updating software and hardware can be a challenge. It requires staying informed and adapting to new technologies to ensure the IT infrastructure remains efficient and effective. Thus, there is an urgent need for research and practical solutions that bridge the gap between IT infrastructure and sustainability in virtual organizations, enabling them to optimize resource utilization, enhance resilience, and minimize environmental footprints while maintaining operational efficiency and competitiveness in the digital era.

Fig. 1.1: Conceptual Framework of Information Technology Infrastructure and Sustainability of Virtual Organizations

Source: Researchers' Conceptualization from the Review of Related Literature 2024

Purpose of the study

The general purpose of this study was to examine the relationship between information technology infrastructure and sustainability of virtual organizations in Port Harcourt. The specific purpose of studying information technology infrastructure and sustainability of virtual organizations, include:

- c) To examine how applications enhances the sustainability of virtual organizations in Port Harcourt.
- d) To evaluate how networks facilitates the sustainability of virtual organizations in Port Harcourt.
- e) To investigate how database enhance the sustainability of virtual organizations in Port Harcourt.

- f) To analyze how data warehousing enhance the sustainability of virtual organizations in Port Harcourt.

Research Questions

The following research questions were posed to guide this study are stated as follows:

- 11. To what extent do applications enhance the sustainability of virtual organizations in Port Harcourt?
- 12. How does network enhance the sustainability of virtual organizations in Port Harcourt?
- 13. How does database enhance the sustainability of virtual organizations in Port Harcourt?
- 14. To what extent does data warehousing enhance the sustainability of virtual organizations in Port Harcourt?

Research Hypothesis

The null hypotheses formulated to guide this study are stated as follows:

H₀₁: There is no significant relationship between applications and adaptability of virtual organizations in Port Harcourt.

H₀₂: There is no significant relationship between applications and accessibility of virtual organizations in Port Harcourt.

H₀₃: There is no significant relationship between network and adaptability of virtual organizations in Port Harcourt.

H₀₄: There is no significant relationship between network and accessibility of virtual organizations in Port Harcourt.

H₀₅: There is no significant relationship between database and adaptability of virtual organizations in Port Harcourt.

H₀₆: There is no significant relationship between database and accessibility of virtual organizations in Port Harcourt.

H₀₇: There is no significant relationship between data warehousing and adaptability of virtual organizations in Port Harcourt.

H₀₈: There is no significant relationship between data warehousing and accessibility of virtual organizations in Port Harcourt.

Significance of the study

The first beneficiaries of this study would be the virtual organizations operating in Port Harcourt, as the study is specifically domiciled in their sector, as a result, at the completion of the study, it is expected that valuable insights will be derived from this study by virtual organizations that will be integral to overall sustainability. Employers of labour and organizational leaders in other sectors will also benefit immensely from the findings of this study, it is expected that superiors will eventually realize the positives that comes with the deployment of information technology infrastructure as it is not only cost effective but also integral to organizational productivity. Government ministries and other public agencies will also benefit enormously from this study such that, superiors in respective agencies will also gain valuable insights from this study as far as information technology infrastructure. Academics and other researchers would also find this study very rewarding as the study

would be used as reference material. Students and future researchers especially those in office and information management will find this research very useful since it will serve as a guide for future researches in the field of office and information management.

Scope of the study

Content Scope: This study focuses on ascertaining the relationship between information technology infrastructure and the sustainability of virtual organizations in Port Harcourt. It covers concepts such as; Applications, Network, Database and Data warehousing are adopted as the dimensions of information technology infrastructure while Adaptability and accessibility are adopted as the measures of sustainability of virtual organizations.

Geographical Scope: This study will embrace virtual organizations in Port Harcourt.

Unit of Analysis: The macro unit of analysis will be adopted. This is because; the leadership of virtual organizations will constitute our target population.

Limitations of the study

This study comes with its own set of challenges and difficulties. Obtaining accurate and comprehensive data from virtual organizations was difficult due to privacy concerns because the researcher must navigate ethical considerations related to data privacy, confidentiality, and informed consent, especially when studying virtual teams or individuals who may be geographically dispersed. Also, finding a sufficient number of virtual organizations willing to participate in research studies was challenging since the researcher requires access to specific industries or types of virtual organizations. The epileptic power supply in the researcher's residential environment greatly affected the work. Finally, the researcher is restricted only to the available information provided by the participants in the research and cannot determine the reliability and correctness of the information provided.

Definition of Terms

The key terms used in this study are systematically highlighted and defined as follows:

Accessibility: This refers to the extent to which something, such as a product, service, environment, or information, is available and usable by people with disabilities or other diverse needs. It ensures that everyone, regardless of abilities or limitations, can participate fully and equally in activities, use facilities, and access information.

Adaptability: This is the ability to adjust or change in response to new conditions, situations, or environments. It involves being flexible, resilient, and able to learn and grow in different circumstances.

Applications: Applications, often referred to as "apps," are software programs designed to perform specific tasks or functions on computers, smart phones, tablets, or other digital devices. They are developed to meet the needs and preferences of users. Applications can be downloaded and installed from various sources, such as app stores, websites, or pre-installed on devices.

Database: This is a structured collection of data organized for efficient retrieval, storage, and manipulation.

Data warehousing: Data warehousing is the process of collecting, storing, and managing large volumes of structured and unstructured data from various sources within an organization. This data is consolidated into a centralized repository, known as a data warehouse.

Information Technology Infrastructure: Information Technology (IT) infrastructure refers to the combination of hardware, software, networks, facilities, and services required for the existence, operation, and management of an organization's IT environment.

Networks: A network is a interconnected system of nodes or entities that communicate and share resources with each other. These nodes can be computers, servers, devices, or even people. Networks can be local, connecting devices within a limited area like a home or office, or wide-reaching, such as the internet, which connects devices globally.

Sustainability: This refers to the ability to meet the needs of the present without compromising the ability of future generations to meet their own needs. It involves balancing economic, environmental, and social considerations to ensure long-term viability and resilience in resource usage, development, and societal well-being.

Virtual organizations: Virtual organizations are entities that operate primarily or entirely through digital means, without a central physical location. They leverage technology to facilitate communication, collaboration, and coordination among geographically dispersed members or teams.

Review of Related Literature

This chapter will discuss the study variables and its underpinning dimensions and measures. Therefore, the following will be discussed under this section.

- e) Theoretical Foundation
- f) Overview of Information Technology Infrastructure
- g) Understanding Information Technology Infrastructure
- a. Applications
- b. Network
- c. Database
- d. Data Warehousing
- h) Sustainability
- c) Adaptability
- d) Accessibility
- e) Resource Based Theory

The baseline theory associated with this study is the resource-based theory (RBT). The resource based theory is an influential approach in strategic management. It has been widely applied as a managerial framework to determine vital resources for a firm to achieve a sustained competitive advantage. The theory provides an essential framework to explain and predict the fundamentals of a company's performance and competitive advantage. Resource-Based Theory (RBT) was first put forward by Penrose (2009), who proposed a model on the effective management of firms' resources, diversification strategy, and productive opportunities. Penrose's publication was the first to propose conceptualising a firm as a coordinated bundle of resources to address and tackle how it can achieve its goals and strategic behaviour (Penrose, 2009). RBT began to take shape in the 1980s. The antecedent of RBT was the Theory of the Growth of the Firm. Later, during the 1990s, Jay Barney's work was critical to the emergence of RBT and became the dominant paradigm in strategic management and strategic planning. RBT provides a framework to highlight and predict the fundamentals of organisation performance and competitive advantage. The focus of RBT on the firm's performance based on Meso's perspectives was a reaction to the earlier managerial interest in the industry structure, a more macro perspective. RBT addresses an internally-driven approach by focusing on internal organisation resources, as opposed to externally driven approaches to understanding the accomplishment or failure of leveraging organisational activities (Kozlenkova, Samaha & Palmatier, 2014). It aims to elaborate on imperfectly imitable firm resources that could potentially become the source of sustained competitive advantage (Barney, 1991).

Overview of Information Technology Infrastructure

In increasingly competitive business environment, information technology (IT) infrastructure is the most important aspect of all aspects of human life,

including business activities where companies are required to keep up their developments in information technology so that they can improve their performance. This is following the research results of (Mithas & Rust, 2016) which stated that information technology has an effect on company performance in reducing costs and increasing revenue. The concept of information technology infrastructure has two relationships even though it has different components; a technical technology information infrastructure and a human technology information infrastructure (Duncan, 1995). Investments in the same information technology infrastructure in one company may result in profitable innovations, but the information technology investment may be less profitable in another company due to the effectiveness of a human technology information infrastructure. This is supported by the research results conducted by Ruiz et al. (2006) which stated that individual and collaborative information technology as well as individual and organizational learning show positive and significant effects on performance. It is also in line with the research results conducted by (Ong & Chen, 2013) which stated that information technology capability has significant effects on company performance in the short and long term.

In addition to the ability of information technology personnel, high company performance is also influenced by information technology investment. This is following the research results conducted by (Ibragimov, 2015) which stated that information technology investment has a strong positive correlation with company performance, in this case, that is measured by the growth of Gross Domestic Product (GDP). Information technology investment is often associated with a company's information technology strategy, whether the company will be an innovator or satisfied to be a defender. The alignment between the information technology strategy and the company's strategy, determine thus a high level of performance will be achieved. This is supported by the research results conducted by (Firman & Said, 2016) stated that information technology strategy has positive and significant effects on company performance directly and by mediating the effects of technology strategy and value creation. Research conducted by (Mithas & Rust, 2016) showed that information technology strategy has an impact on company performance, such as the impact on cost reduction and revenue growth, but this emphasis on performance also depends on the level of company investment (Gueymard, 2017).

Understanding Information Technology Infrastructure

Information technology infrastructure as the basic foundation of information technology capabilities which includes internal techniques (among others: equipment, software and cabling as well as human expertise) that are needed to provide reliable services. According to (Mauerhoefer et al., 2017) information technology infrastructure refers to information technology hardware, communication and data networks as well as information technology employees who are needed to support the distribution of information technology tools. In this study, the information technology infrastructure is represented under the following sub-headings; information technology Capabilities, information technology investment and information technology strategy.

Information Technology Capability

Cepeda & Arias-Pérez (2019) state that information technology capability is an organization's ability to find, implement and developing IT resource and reconfigure IT resources in order to achieve competitive advantage. IT capability is a corporate ability in managing IT resources, where IT capabilities are an important aspect is to achieve business value, business strategies and improving work processes (Cai, 2016). The IT capabilities in this research are the abilities of virtual organizations' leaders to deploy necessary information technology infrastructure so as to effectively drive organizational objectives and overall sustainability.

Information Technology Investment

IT investment can include projects or activities to the development, modernization, enhancement, or maintenance of an IT asset in accordance with their functions and operation as well as with production environment (The IT Law Wiki, 2020). In this project, the IT investment includes all the costs that are incurred by virtual organizations for procurement, development, maintenance of IT assets and IT employee.

Information Technology Strategy

According to Sibanda, & Ramrathan (2017) information technology strategy is the actualization of planning, which consists of tactics, principles and goals related to the use of IT in organizations. Alignment of IT strategy with business strategy is essential in achieving performance and overall sustainability. In this study, the IT strategy is the actualization of planning in the use of IT that is aligned with virtual organization's strategy to achieve sustainability.

Dimensions of Information Technology Infrastructure

In this study, information technology infrastructure is addressed under four dimensions which includes; applications, network, database and data ware housing.

Applications

According to techtarget.com applications are software, or programs, consists of all the electronic instructions that tell the computer how to perform a task. The term software was coined by John Tukey. Application software is a set of programs designed for specific uses or applications such as word processing, graphics or spreadsheet analysis. These applications are designed to satisfy a particular need of a particular environment. Application software, designed to satisfy one purpose may not be able to solve other purpose of the same user. For example, software for financial management cannot be used for designing two-dimensional graphics. Similarly, we have word processors for letter writing and presentation software for presentations. We cannot interchange the use of two application software with each other.

Application software can be custom-made but are usually purchased from a software store. Some of the popular application packages are Word processors, Spreadsheets, Database system, Accounting packages, DTP packages, Graphic packages and Antivirus software. Word processing software allows you to create, edit, format, print, and store text material, among other things. Word processor is the most common application software. The well known word processing programs are Microsoft Word, Writer, Wordpad, Text Editor and Star Word. Microsoft Word (MS-Word) is the most popularly used word processing application software that provides you with a number of useful and fabulous features to process the text. A word processor, in general, can be used to manipulate the text in a variety of ways. In addition to it, you can save your documents in a word processor and use them according to the need, whenever required. The features that are provided by any word processor (as editing, formatting text) are available in MS-Word, which also supports some additional and special features (*e.g.*, mail merge).

Techtarget.com posited that word processing is by far the most widely used computer application because it is used for communication, our most common activity. Word processor is used to write, edit and format memos, letters, reports, manuscripts, contracts, and every imaginable type of documents. No matter what the information is or what form it takes, the chances are it was initially composed and written using a word processing program. A word processor is software which provides a graphical user interface with better

capabilities than a text editor does. The main advantage of a word processor is that it provides WYSIWYG (What You See Is What You Get) interface which helps you make changes quickly and easily.

Network

According to Wikipedia (2006) a computer network (network) is a communication network that allows computers to communicate with each other by exchanging data. The purpose of a computer network is to be able to achieve its goals, every part of a computer network can request and provide services (service). The service requester/recipient is referred to as the client (client) and the service provider/sender as the server (server). This model is called a client-server system and is used in almost all computer network applications. Two computers, each with a network card, are then connected by cable or radio as a means of communication and the network operating software forms a simple computer network. If you want to create a computer network with larger dimensions, additional devices such as connection devices are needed, *eg.* For example. hubs, bridges, switches, routers, gateways. The history of computer networks began with the birth of the concept of computer networks in America in the 1940s, which started with the MODEL I computer development project from the Bell Laboratory and a Harvard University research group led by Professor Howard Aiken. Initially, the project wanted to use only one computing device, which had to be shared. To work on many processes without wasting a lot of free time, batch processes were created to allow one computer to run many programs with one queue rule. Then in the 1950s, because the types of computers began to develop through the development of supercomputers, computers had to serve several available locations (terminals).

The development of information science is increasing rapidly, this is evident in the era of the 80s, computer networks are still a mystery that scientists want to answer, and in 1988 they started using computer networks in universities, and in 1988 they started using computer networks. . For businesses now entering the millennium, the global internet in particular has become a daily reality for millions of people around the world. In addition, network hardware and software have changed substantially: at the dawn of development, almost all networks were built with coaxial cable; today many are built with fiber optic or wireless communications. Computer networks allow devices to connect to each other. As an example: Transfer files, share resources, and communicate electronically With the development of computing and communication technology, a single

computer model that performs all organizational computing tasks has now been replaced by separate computers that are interconnected with each other in carrying out their duties. Such a system is called a computer network (Wikipedia, 2006).

Computer networks are built using a combination of hardware and software. When two or more computers communicate or exchange data with each other, a computer network has a part that receives or requests services called a client and a part that provides or sends services is called a server. This type of design is often referred to as a client-server system. This networked computer must also have at least 1 network card, which is then connected via cable or wireless as a data transmission medium and network operating software to form a simple computer network. If you want to create a wider computer network, you need additional devices such as hubs, switches, routers, etc. to support it. There are various types of computer networks that we often see and are classified according to their range, namely:

LAN (local area network)

LAN or Local Area Network is a concept that connects network devices over relatively short distances. Usually used for school buildings, offices, homes, etc. This LAN concept usually uses a special connection, especially Ethernet and Token Ring. There is also a local area network that uses wireless or wireless network technology with WI-FI and is known as a Wireless Local Area Network (WLAN).

3. MAN (Metropolitan Area Network)

MAN or Metropolitan Area Network is a concept that connects network devices from one city to another. Meanwhile, building a network using a local area network is no longer possible, MAN networks are used because their reach is wider than LANs, MANs use special equipment and require telecommunications operators to act as a link between computer networks.

4. WAN (Wide Area Network) WAN or Wide Area Network is a concept that connects computer network devices that cover a very wide area and use very sophisticated equipment. Compared to MAN and LAN networks.

The concept of this network itself is usually used to connect a network from one country to another, ie. H. between countries and even between continents. An example of such a complex device is fiber optics, which are installed underground or under the sea. In the development of computer networks, this cannot be distinguished from the term topology, where topology can be described as the shape or structure of a virtual

network that refers to the arrangement of connected devices, although this shape does not always match (Wikipedia, 2006)

Database

Database systems are any logically coherent collection of data organized for storage and retrieval by computers, as a single, possibly large, repository of data that can be used simultaneously by multi-users (Gehani, 2006). Databases provide a high level of structure for the collection of data. Structured collection of data leads to a consistency that is essential for the operation of an IMS. Data within a database are captured electronically with a relatively small amount of storage space compared with conventional paper records. Databases also allow the use of queries and search tools, which make the retrieval of information from even large amounts of data fast and highly specific.

Berkowitz (1998) posits that the two main types of databases are flat-file and relational databases, in both of which the data are placed in tables with columns and rows. However, in a flat-file database, the data are placed within a single, spreadsheet-like table. In a relational database, each of several tables contains a specific type of information, and the tables are linked by primary and secondary keys. Flat-file databases can be very efficient when there are simple one-to-one relationships between the data (e.g., one patient to one medical record number [MRN]). When the data have one-to-many or many-to-one relationships (e.g., one physician to many patients or vice versa), it is best to use a relational database. Relational databases are preferred to flat-file databases for all but simple applications that are limited in scope.

According to Hawkins, Hugh, Young Scot, Hubert, Katherine, and Hallock (2007), a popular high-level data model used in logical database design is based on the concepts of the Entity-Relationship (ER) model. Currently there is no standard notation for an ER model covering database design for relational DBMSs tending to use one of two conventional notations such as: (i) Chen's notation, consisting of rectangles representing entities and diamonds representing relationships, with lines linking the rectangles and diamonds; (ii) Crow's Feet notation, again consisting of rectangles representing entities and lines between entities representing relationships at the end of a line represents a one-to-many relationship. The database is now such an integral part of our day-to-day life that often we are not aware we are using one. A database application is a computer program that interacts with the database in some way, while database system is a collection of database applications that interacts with the database along with the DBMS and the database itself. Hence, the basic functions of a database are

provided by a DBMS through a database engine; a software system that manages how data is stored and retrieved (Connolly & Carolyn, 2002). For example, Microsoft Jet is a database engine which is a subsystem of Visual Basic and Microsoft Access for stand-alone implementation; while Microsoft SQL Server is for Client - Server implementation. Users interact with the database through a number of database applications that are used to create and maintain the database and to generate information. These programs can be conventional batch applications or, more typically nowadays, online applications. The database applications may be written in a third-generation programming language such as C++ or Java, or in some higher-level fourth-generation language. The physical structure and storage of the data are managed by the DBMS (Date, 2013).

Data Warehousing

According to Abello et al, (2000) the popularity of data warehouses grew fast during the last years. They posited that data warehouse is a subject-oriented, integrated, time-varying, non-volatile collection of data that is used primarily in organizational decision making.” (Auth & Maur, 2002) defined data warehouse as “the huge, silent storage that extracts and then stores the data from the separated transactional system on daily basis. The data warehouse is the decision support database.” From these definitions, we can summarize that a data warehouse collects and stores integrated sets of historical data from multiple operating systems, provides end-user access, enables the knowledge worker to make better decisions or conduct accurate analysis. Thus, the data warehouse is the foundation of Decision Support System (DSS) processing.

According to Rajan (n.d.) data warehouse potential can be magnify if the appropriate data has been collected and stored in a data warehouse. A data warehouse is a relational database management system (RDBMS) designed specifically to meet the needs of transaction processing system. It can be loosely defined as any centralized data repository, which can be queried for business benefit, but this will be more clearly defined later. Data warehouse is a new powerful technique making. It possible to extract archived operational data and overcome inconsistencies between different legacy data formats, as well as integrating data throughout an enterprise, regardless of location, format, or communication requirements it is possible to incorporate additional or expert information it is.

The logical link between what the managers see in their decision Support EIS application and the company's operational activities Johan McIntyre of

SAS institute Inc. In other words the data warehouse provides warehouse provides data that is already transformed and summarized, therefore making it an appropriate environment for the more efficient DSS and EIS applications.

A data warehouse is a collection of corporate information, derived directly from operational system and some external data sources. Its specific purpose is to support business decisions, not business as “What if?” questions. The answer to these questions will ensure your business is proactive, instead of reactive, a necessity in today's information ago (Rajan, n.d.).

He further stressed that industry trend today is moving towards more powerful hardware and software configuration; we now have the ability to process vast volumes of information analytically, which would have been unheard of tenor even five years ago. A business today must we able to use this emerging technology or run the risk if being information under loaded. As you read that correctly - under loaded - the opposite of over loaded. Overloaded means you are to determine what is important. If you are under loaded, you are information deficient. You cannot cope with decision – making expectation because you do not know where you stand. You are missing critical pieces of information required to make informed decisions.

Concept of Sustainability

According to Bestman & Sam (2022), the concept of sustainability has gained and attracted lots of attention in recent times, as organizations with its stakeholders are turning their attention towards this critical issue of sustainability that encompasses the economic, environmental and social dimensions of sustainability. Sustainability of businesses has been gaining its rightful recognition and importance as it offers competitive advantage and creates value for organizations, their stakeholders, and society (Bonini & Gerner, 2011). However, according to (Hong, Roh & Wawski, 2012) sustainability has not been fully integrated at the strategic and operational level. Some researchers believe that the main hurdle in operationalization of sustainability in organizations is the lack of maintainable value creation throughout the value chain, because parts of these activities are beyond the control of organizations, such as supply chain. Others argue that it is the lack of practicable frameworks and models which holds back the organizational actors from (holistically) considering sustainability in business decisions (Nawaz & Koc, 2018). The latter is particularly important because existing sustainability management models and frameworks are based on conceptual and theoretical designs. The structure of these models lacks a fundamental practicable approach which limits their

use in practice. In order to increase the potential application of existing organizational sustainability models, it is important to integrate the sustainability best-practices within the structure of these models. The reason for this is fairly simple: organizational actors generally prefer ‘practical rationale’ over ‘scholarly intellect. Besides applicability, the integration of theories and practices enables the model/framework developers to understand and address the practical limits of organizations in managing sustainability.

Adaptability

Adaptability is the ability of an organization to recognize the need to change and seize opportunities in dynamic environments. In an increasingly complex world, leadership must pay close attention to dynamic, distributed, and contextual aspects in order to position their organizations for adaptability. The theory of dynamic capabilities constitutes a central concept for the requirements that enable organizational adaptability. According to (Uhl-Bien & Arena 2018), Adaptation to changing environmental conditions is a focal subject of organizational studies and deemed a necessity for organizations in every industry. The dynamic nature of most competitive environments requires organizations to continuously or periodically innovate in order to create a competitive advantage and eventually to survive (Hauschildt et al. 2016). Wiltbank et al. (2006) highlighted the significant empirical support for adaptive organizations having higher chances to succeed; in his words, flexible and adaptive organizations are able to outmaneuver their competitors by quickly capturing new opportunities. This can ultimately lead to improvements in the competitive position of an organization and increase the organization’s performance. A central concept capturing the notion of the need for organizations to change is organizational adaptability, which (Birkinshaw & Gibson, 2004) defined as “the ability to move quickly towards new opportunities, to adjust to volatile markets and to avoid complacency”. Among the many theories that were established covering organizational change, a common parameter of all theories is that change is oriented towards a specific individual goal (van de Ven & Poole 2005). Thus, initiating change in an organization is an active decision to achieve a certain outcome, and organizations must create readiness for change. Taking an active decision requires that organizational change should be managed consciously by considering factors that enable change, such as the required knowledge and skills, resources and commitment (Al-Haddad & Kotnour, 2015). In other words, certain capabilities are required in order to successfully manage an organizational change process. The

relevance of adaptability as a measure of the sustainability of virtual organizations cannot be over emphasized. When the goals and objectives of virtual organizations are attained, employees are retained, increased patronage, satisfied clients act as referral agents; undoubtedly, these positive outcomes will ultimately improve the overall productivity and overall sustainability of the firms.

Accessibility

The terms *access* and *accessibility* have been in circulation for at least a century, and their usage generally connotes availability and physical accessibility for a certain population (Guy, 1983). The word *access* in English originated from Latin, meaning “accession” (Hoad, 1996). In contemporary policy discourse in English, however, access is defined as making information and communication technologies (ICTs) widely available to all citizens (Wise, 1997). Echoing this meaning of access, the *Oxford English Dictionary* defines accessibility as “the quality or condition of being accessible (in various senses)” (Oxford University Press, n.d.). It further defines accessible as “capable of being conveniently used or accessed by people with disabilities; of or designating goods, services, or facilities designed to meet the needs of the disabled.” To discuss accessibility, understanding how access, accessibility, and accessible *design* have become common terms (with fluid definitions) in technical communication today is important. This essay will unpack these terms by considering both historical definitions and contemporary perspectives.

Not only do the terms access and accessibility have different meanings, but researchers also differ in how they relate the terms and establish their connection to disability. These differing views represent the perspectives of technical standards organizations, digital rhetoricians, disability activists, and disability studies-centred design scholars. The International Organization for Standardization (2014) defines accessibility as the “extent to which products, systems, services, environments and facilities can be used by people from a population with the widest range of characteristics and capabilities to achieve a specified goal in a specified context of use” (n.p.). James Porter, a digital *rhetoric* scholar, makes a distinction between access and accessibility. “Access,” Porter explains, “is the more general term related to whether a person has the necessary hardware, software, and network connectivity in order to use the Internet—and to whether certain groups of persons have a disadvantaged level of access due to their race, ethnicity, socioeconomic status, gender, age, or other factors” (2009). Accessibility, on the other hand, “refers to the level of connectedness of one particular

group of persons—those with disabilities” (Porter, 2009). Porter also adds that “the reason to write/design for accessibility is not only to allow people with disabilities to consume information, but to help them produce it”. Activists in the disability field do not always make Porter’s distinction. For example, the University of Leeds’ Centre for Disability Studies employs *access* as the search term for all accessibility-related entries on its website. Speaking from a disability studies-centred design perspective, (Sushil Oswal 2013) describes accessibility more broadly as “the ability to use, enjoy, perform, work on, avail of, and participate in a resource, technology, activity, opportunity, or product at an equal or comparable level with others” (n.p.). As these varying definitions from different disciplines suggest, accessibility is shaped by a number of factors which can change from context to context and are both spatial and temporal in nature: physical distance from resources and opportunities, the availability of *technology* and means to overcome that distance, and the infrastructural and legal resources to overcome barriers to workplace entry. For example, for full integration into society, a disabled person not only needs a job to support them self and their family but also laws to protect them from discrimination by employers and providers of services, consistent access to adaptive technology and special training for holding on to a job, accessible opportunities to participate in recreational activities, and of course, availability of inclusively designed consumer goods for living a comfortable life (Wilson & Lewiecki-Wilson, 2001).

Since technical communication is preoccupied with design and communication of information, and since information is imbedded everywhere in human environments, the field’s scope extends into the accessibility of both the brick-and-mortar and digital spaces (Whitehouse, 1999). Accessibility in the former can consist of signage, directories, and spatial maps-digital and otherwise—whereas accessibility in the latter refers to a range of ICTs, including “computer hardware and software, digital broadcast technologies, telecommunications technologies such as mobile phones, as well as electronic information resources such as the world wide web” (Selwyn,

2004). The World Wide Web Consortium’s (W3C) web content accessibility guidelines (2.1) breaks down accessibility into four elements in terms of the interactivity of the web for the disabled user: perceivable, operable, understandable, and robust (Web Accessibility Initiative, 2019). Though W3C’s intent for these guidelines is to assist developers in designing accessible websites from the bottom up, more often, these are used for checking the accessibility of already built websites for the purpose of retrofitting them with accessibility (Wentz et al., 2011).

Methods

This chapter tends to explain and highlight the methods and procedures that will be used for the collection of data to be analyzed in order to achieve the study objectives. This chapter is organized under the following subheadings;

- i. Research Design
- ii. Population of the Study
- iii. Sample/Sampling Technique
- iv. Instrument for Data Collection
- v. Reliability of Instrument
- vi. Validity of Instrument
- vii. Administration of Instrument
- viii. Data Analysis Techniques

Research Design

This empirical study adopted a cross sectional research design which is a form of the quasi experimental research design in its assessment of the study variables.

Population of the Study

The study population was drawn from 12 registered and functional virtual organizations in Port Harcourt, Rivers State. And this information was obtained from the human resources units of each of the organizations under investigation. As a macro study, only management staff of these organizations were studied.

Table 3.1: Names of Virtual Organizations

Names of virtual Organizations		Participants
1.	MTN Nigeria	19
2.	Mobile	16
3.	DSTV Nigeria	12
4.	GOTV	12
5.	Kuda Bank	12
6.	VBank	12
7.	Opay	12
8.	Sparkle	12
9.	PalmPay	12
10.	Fundal	12
11.	Gomoney	12
12.	ALAT	12

Source: Field Survey, 2024

Sample and Sampling Technique

Due to the large nature of the population and our inability to study the entire population, a sample size of 155 was conveniently chosen from the regional offices and branches of 12 functional and operational virtual organizations in Port Harcourt. The sample was arrived at by conveniently choosing managerial staff of virtual organizations in Port Harcourt, since they are in position to give useful and reliable information to the problem under investigation.

Instrument for data Collection

The study utilized structured questionnaire as the instrument for data collection. It contained structured items on the study variables. A five-point rating scale was used and the respondents responded thus;

Very High Extent (VHE)	-	5 Points
High Extent (HE)	-	4 Points
Moderate Extent (ME)	-	3 Points
Low Extent (LE)	-	2 Points

Very Low Extent (VLE) - 1 Point

Validation of the Instrument

This refers to the extent/degree to which an instrument measures what is intended to measure. The researcher employed content validity in the reports to obtain information from the respondents and face validation made by an expert in the field. The data was pre-tested on a group of managers outside our scope of study with a view to ascertaining their suitability for the study.

Reliability of the Study

The test-retest reliability test has the disadvantage of being influenced by patience and memory. The Cronbach's Alpha coefficient aided the researcher in testing the internal reliability of the measures through the Statistical Package for Social Sciences (SPSS). Only items that returned alpha values of 0.7 and above were considered reliable enough for the study.

Table 3.2 Internal Reliability of the instrument

S/No	Variables	Number of items	Number of cases	Cronbach's Alpha
1	Applications	3	136	0.782
2	Networks	3	136	0.702
3	Database	3	136	0.779
4	Data Warehousing	3	136	0.761
5	Adaptability	2	136	0.810
6	Accessibility	2	136	0.726

Source: SPSS OUTPUT, 2024

Administration of Instrument

A total of one hundred and fifty-five (155) questionnaires were administered to the respondents using different online platforms such as their verified social media handles and emails. This was done by the researcher with the help of a research assistant.

Methods of Data Analysis

Descriptive statistic was adopted in the analysis of the properties and demographic coverage while the inferential statistics was used for the test of correlation using the Spearman rank order of correlation coefficient statistical tool. Data analysis

was done using the statistical software for social sciences (SPSS) version 23; with data presentations illustrated using contingency tables and charts.

Analysis and Interpretation of Data

The presentation of the descriptive and inferential analysis of the survey data. The results of this are interpreted to arrive at our study findings. In order to achieve this objective, 155 structured questionnaires copies based on an estimated sample size of the study were administered to leaders of virtual organizations in Port Harcourt, Rivers State. Below is the questionnaire distribution success rate.

Table 4.1: Presentation of Questionnaire Distribution.

<i>Particulars of questionnaire</i>	<i>Frequency</i>	<i>Percentage</i>
Number of questionnaire administered.	155	100
Number of questionnaire retrieved	149	96.13
Number of questionnaire not returned	6	3.87
Number of questionnaire wrongly filled	13	8.72
Number of usable questionnaire	136	91.28

Source: Field Survey, 2024

From table 4.1, it is observed that 155 questionnaires were administered to respondents. 6 questionnaires representing 3.87 percent were not returned. 149 questionnaires representing 96.13 percent were returned. However, out of this number only 136 questionnaires representing 91.28 percent were correctly filled and thus suitable for data analysis.

Data Analysis

The data analysis for this study is categorized into two; descriptive and inferential. The descriptive analysis examines socio-demographic samples and primary data analysis while the inferential analysis examines the test of previous hypothesized statements.

Demographic Analysis

Table 4.2 Showing Sex Distribution of Respondents

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	76	55.9	55.9
	Female	60	44.1	100.0
	Total	136	100.0	

Source: Research Data , 2024 (SPSS output, version 23.0)

Fig Sex Distribution of Respondents

Table 4.2 shows that 76 (55.9%) of the respondents are males while 60 representing (44.1%) of the respondents are female. Indicating that we had more of males as our respondents

Fig Illustrating Marital Status Distribution

The figure above illustrates the marital status of participants with the proportion of married respondents at 70% more than that of single respondents which stood at 25% and divorced respondents at 5% respectively. This implies that most of the staff in the target population are married.

Showing Age Distribution of Respondents

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	30-35 years	12	8.8	8.8	8.8
	36-40 years	36	26.5	26.5	35.3
	45-50 years	51	37.5	37.5	72.8
	51-60 years	37	27.2	27.2	100.0
	Total	136	100.0	100.0	

Source: Research Data, 2024 (SPSS output, version 23.0)

Age Distribution of Respondents

From the data in table 4.3, it can be observed that 12 representing 8.8 percent of the respondents fall within the age bracket of 30-35. Also, 36 respondents representing 26.5 percent fall within the 36-40 years age mark. Furthermore, 51 of the respondents

representing 37.5 percent were observed to have fallen within the 45-50 years age bracket and finally 37 respondents representing 27.2 percent of the total respondents were 55-60 years age bracket.

Table Showing Educational Levels of Respondents

	Frequency	Percent	Valid Percent	Cumulative Percent
OND/Diploma	43	31.6	31.6	31.6
First Degree	39	28.7	28.7	60.3
Valid Post Graduate Degrees	37	27.2	27.2	87.5
Professional Certifications	17	12.5	12.5	100.0
Total	136	100.0	100.0	

Source: *Research Data, 2024 (SPSS output, version 23.0)*

Fig Qualification of Respondents

The data in table 4.4 portrays the educational level and qualification distribution of the respondents. From the results above, 43 respondents indicating 31.6 percent of the respondents were OND/Diploma holders, while 39 respondents representing 28.7 percent were First Degree holders, 37 respondents showing 27.2 percent of the respondents hold post graduate degrees while 17 respondents indicating 12.5 percent are holders of professional certifications.

Primary Data Analysis

The primary data analysis is characterized by frequency of responses mean and standard deviation

score of the responses on the item on the questionnaire and study variables. In this section, analysis was carried out on individual variables and their measures. Mean scores and standard deviations are also illustrated. The independent variable; Information Technology Infrastructure dimensioned into; Applications, Networks, Databases and Data Warehousing is first analyzed and measured on a 3 item instrument and scaled on a 5 point Likert scale (very low extent -1, low extent -2, moderate extent -3, high extent -4 and very high extent -5).

Table 4.3: Showing dimensions of Information Technology Infrastructure

	N	Minimum	Maximum	Mean	Std. Deviation
Applications	136	1.00	4.00	3.83	1.016
Networks	136	1.00	4.00	3.93	.696
Databases	136	1.00	4.00	3.67	.944
Data Warehousing	136	1.00	4.00	3.74	.987
Valid N (listwise)	136				

Source: Research Data, 2024 (SPSS output, version 23.0)

Table above illustrates the descriptive statistics for the dimensions of Information Technology Infrastructure which are applications, networks, databases and data warehousing with a mean score of 3.83, 3.93, 3.67,

3.89 and 3.74 respectively. All four dimensions indicate high response rates based on the adoption of a 5 point Likert scale.

Descriptive Statistics Showing Measures of Sustainability

Source: Research Data , 2024 (SPSS output, version

and scaled on a 5 point Likert scale (very low extent -1, low extent -2, moderate extent -3, high extent -4 and very high extent -5). All measures indicate high

	N	Minimum	Maximum	Mean	Std. Deviation
Adaptability	136	1.00	4.00	4.06	.699
Accessibility	136	1.00	4.00	3.8407	1.00038
Valid N (listwise)	136				

23.0)

Table above illustrates the summary and descriptive statistics for the measures of sustainability which are adaptability and accessibility with mean scores of 4.06 for adaptability and 3.8407 for accessibility. These were analyzed and measured on a 2 item instrument

response rates based on the adoption of a 5 point Likert scale.

Finally, on the descriptive statistic is the analysis of data on study variables. These are Information Technology Infrastructure and Sustainability.

Study Variables

	N	Minimum	Maximum	Mean	Std. Deviation
Information Technology Infrastructure	136	1.00	4.00	3.8324	.72894
Sustainability	136	1.00	4.00	3.9522	.75575
Valid N (listwise)	136				

Source: Research Data, 2024 (SPSS output, version 23.0)

Table 4 illustrates the summary and descriptive statistics for the study variables where information technology infrastructure = 3.8324 and sustainability = 3.9522. All variables have high mean values and agreement rates based on the adoption of a 5 point Likert scale.

Hypotheses Testing

Ho₁: There is no significant relationship between applications and adaptability of virtual organizations in Port Harcourt, Rivers State.

First Finding: From the result in the table above, the correlation coefficient (rho) shows that there is a significant and positive relationship between applications and adaptability of virtual organizations. The *correlation coefficient* = 0.562 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.000 ($p < 0.05$). The correlation coefficient represents a moderate correlation between the variables. Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

Ho₂: There is no significant relationship between applications and accessibility of virtual organizations in Port Harcourt, Rivers State.

This section involves the testing of all previous hypothesized bivariate relationships at a 95% confidence interval implying a significant level of 0.05, acceptance or rejection relative to the p value. The Spearman correlation coefficient statistical tool was adopted in the test for correlations and strength of relations.

Second Finding: There is a significant relationship between applications and accessibility of virtual organizations in Port Harcourt where the *correlation coefficient* of 0.562 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.000 ($p < 0.05$). The correlation coefficient represents a moderate correlation between the variables. Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

Ho₃: There is no significant relationship between networks and adaptability of virtual organizations in Port Harcourt, Rivers State.

Third Finding: There is a significant relationship between networks and adaptability of virtual organizations in Port Harcourt where the *correlation coefficient* of 0.889 confirms the magnitude and strength of this relationship and it is significant at

probability value = 0.009 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

H04: There is no significant relationship between networks and accessibility of virtual organizations in Port Harcourt, Rivers State.

Fourth Finding: There is a significant relationship between networks and accessibility of virtual organizations in Port Harcourt where the *correlation* coefficient of 0.899 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.009 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

H05: There is no significant relationship between databases and adaptability of virtual organizations in Port Harcourt, Rivers State.

Fifth Finding: There is a significant relationship between databases and adaptability of virtual organizations in Port Harcourt where the *correlation* coefficient of 0.848 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.012 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

H06: There is no significant relationship between databases and accessibility of virtual organizations in Port Harcourt, Rivers State.

Sixth Finding: There is a significant relationship between database and accessibility of virtual organizations in Port Harcourt where the *correlation* coefficient of 0.868 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.018 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

H07: There is no significant relationship between data warehousing and adaptability of virtual organizations in Port Harcourt, Rivers State.

7th Finding: There is a significant relationship between data warehousing and adaptability of virtual organizations in Port Harcourt where the *correlation* coefficient of 0.848 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.012 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

H08: There is no significant relationship between data warehousing and accessibility of virtual organizations in Port Harcourt, Rivers State.

Eight Finding: There is a significant relationship between data warehousing and accessibility of virtual organizations in Port Harcourt where the *correlation* coefficient of 0.868 confirms the magnitude and strength of this relationship and it is significant at probability value = 0.018 ($p < 0.05$). Therefore, we reject the null hypothesis. Decision is based on the $p < 0.05$ coefficient of significance.

Summary, Conclusions and Recommendations

This chapter presents a summary of the findings, conclusions and finally makes recommendations in respect of future study.

Summary of Findings

The aim of this study was to assess the relationship between information technology infrastructure and sustainability of virtual organizations in Port Harcourt, Rivers State. The study was operationalized with the independent variable as information technology infrastructure with the following dimensions: applications, networks, databases and data warehousing, while the dependent variable was sustainability with adaptability and accessibility as measures.

The outcome of the descriptive and inferential analysis revealed the following;

15. There is a moderate and positive relationship between applications and the sustainability of virtual organizations in Port Harcourt, Rivers State.
16. There is a moderate and positive relationship between networks and the sustainability of virtual organizations in Port Harcourt, Rivers State.
17. There is a significant relationship between database and the sustainability of virtual organizations in Port Harcourt, Rivers State.
4. There is a significant relationship between data warehousing and the sustainability of virtual organizations in Port Harcourt, Rivers State.

Conclusions

The study concludes that information technology infrastructure positively enhances the sustainability of virtual organizations in Rivers State. In line with the specific objectives the following conclusions emerged: Applications moderately enhance the sustainability of virtual organizations in Rivers State, Nigeria. Also, network positively enhances the sustainability of virtual organizations in Rivers State. Again, databases positively enhance the sustainability of virtual organizations in Rivers State. Furthermore, data warehousing positively enhances the sustainability of virtual organizations in Rivers State.

Recommendations

Management of virtual organization in Rivers State should implement the utilization of relevant applications in order to enhance the sustainability of virtual organizations.

Leaders of virtual organizations should invest heavily on the acquisition of networks so as to drive the sustainability of virtual organizations.

Management of virtual organizations should integrate their databases in order to enhance administrative efficiency of virtual organizations in Rivers State.

They are also encouraged to adopt data warehousing as a strategy for reporting and presentation, so as to make smarter and intelligent business decision

Abstract

This study examines the effects of Public-Private Partnerships (PPPs) expenditure on road (PERI) and electricity infrastructure (PEEI) on Nigeria's economic growth process, proxy by real gross domestic product (RGDP), from 2000 to 2024. An unrestricted Vector Autoregressive (VAR) and Vector Error Correction (VEC) models were adopted to forecast the short and long run dynamic relationships between the multiple time series variables. The Augmented Dickey Fuller (ADF) unit root test was conducted to determine the stationarity of the series while the Johansen cointegration test was used to determine the long run relationship of the series. The findings show that real gross domestic product was positively related to public-private partnership expenditure on road infrastructure but not statistically significant in explaining changes in public-private partnership expenditure on road infrastructure. Public-private partnership expenditure on electricity infrastructure was positive but not statistically significant in explaining changes in public-private partnership expenditure on road infrastructure. However, real gross domestic product was negative and not statistically significant in explaining changes in public-private partnership expenditure on electricity infrastructure. The study recommended a more holistic, diverse and innovative financing models, digitized project management and regulatory process and strategic plans that embraces communities and stakeholders in order to promote a culture of shared responsibility for infrastructure.

Introduction

The importance of infrastructure to economic growth cannot be overemphasized. This is because infrastructure forms the pillar or backbone of every society and economies, promoting daily life by providing essential services like clean water, education, energy, healthcare, sanitation, internet and transportation (Mienye et al., 2024). Good and sustainable infrastructure investment promote economic growth through increased job creation, efficiency, productivity and reduction in social and economic inequalities by improving access to business

opportunities, facilitating the movement of goods and services and supporting supply chains and hence, alleviates poverty (Zeng et al., 2024). Modern and well maintained infrastructure enhances quality of life and safety through well-lit streets and sidewalks, which reduces risk and promotes public safety, which are pre requisite for human wellbeing (Zahnow, 2024). Infrastructure also provides resilience against challenges like natural disasters and climate change, enhancing continuity and enabling sustainable growth and development for every nation (Ma et al., 2023). Furthermore, a robust and viable infrastructure

framework puts a country in a better competitive position, attracting both local and foreign investment and fostering innovations which are major drivers of growth and development (Danja & Wang, 2024). Investment in modern and sustainable infrastructure, like constant and affordable power supply, good roads and effective internet services, can potentially reduce the cost of doing business in the country, make cheaper goods and services available and hence reduce inflation, a core macroeconomic objective of every economy (Olabi et al., 2023).

In relation to the importance of infrastructure to the viability of the economy, the Nigerian government participates in infrastructure development through direct budget investment, establishment of regulatory bodies like the Infrastructure Concession Regulatory Commission (ICRC), and the utilizing Public-Private Partnerships (PPPs) to bridge the infrastructure deficits in the country (Kadiri et al., 2015). Through direct budgetary investment, the government finances infrastructure through direct budget spending from the federal, state and local government revenue (Bao et al., 2024). Through regulatory frameworks, like the ICRC, the government ensures that the policies, rules and purpose of the infrastructure development process are achieved and maintained (Azubuike et al., 2023). The government sometimes partners with the private sector to finance and develop infrastructure projects in a bid to addressing the infrastructure deficiency and inequalities which has been a bane to sustainable growth and development in Nigeria (Olujobi et al., 2023). In the same to address the deficit, the government created the Nigeria Infrastructure Fund (NIF), with the aim of attracting local and foreign investments into domestic infrastructure projects across Nigeria, with focus on education; healthcare; power generation, transmission and renewable energy projects; road construction, expansion, and an Aviation Leasing Company and a National Carrier, through Public-Private Partnerships (PPPs) (Shao et al., 2025).

Private Sector Participation (PSP) in the Nigeria infrastructure development has usually been in PPPs and other models, with significant involvement in energy, education, healthcare, ports, transportation and solid waste management, with the aim of leveraging private sector efficiency and capital for projects completion and quality service delivery (Olukanni & Nwafor, 2019). The national PPPs policy and other supportive legislations that ensure the successful completion of projects faces challenges like political influence, unclear contract terms and regulatory weakness, especially in energy and water (Bagenda & Ndevu, 2024). Another key mechanism of Private Sector Participation (PSP) other than PPPs is the Concession Agreement (CA). A good example is the

Build-Operate-Transfer (BOT) model, a common Public-Private Partnership (PPP) arrangement located at the Lagos Murtala Mohammed International Airport Terminal 2 (MMA2), built and operated by a private company, but later transferred ownership and control to the Nigerian government. Filling the infrastructure gap, improving efficiency and innovations through cutting-edge technology and efficient management techniques and the need to stimulate economic growth and development, are some of the drivers of Private Sector Participation (PSP) in infrastructure development in Nigeria (Diugwu et al., 2015).

Despite huge investment on infrastructure development through PPPs, Nigeria still wallow in severe infrastructure deficit which has adverse effects on her economic growth and development process across sectors like housing, power, healthcare and roads (Onwuemeka et al., 2022). With a huge gap estimated to require trillions of naira in infrastructure investment and a projected population of about 400 million in 2050, does Nigeria have the appropriate plans, resources, technology and strategies to bridge the infrastructure deficit gap and enhance the resilience and inclusivity of the infrastructure network? For instance, as at 2024, about 80% of Nigeria's road networks are in poor state, hindering effective connectivity, production and economic growth (Wudad et al., 2024). There is a significant housing deficit, with a shortage of about 28 million housing units in Nigeria, representing the urgent need to provide adequate shelter for the growing population, especially in urban areas (Ezeanah, 2022). Reports between 2024 and 2025 revealed that about 59.5% to 61% of the Nigerian population has access to electricity supply (World Bank, 2025). However, the national electricity grid is highly unreliable with rising electricity demand from population pressure, causing its numerous collapses (Golobish et al., 2025). Furthermore, a substantial deficit exist in clean water supply and sanitation infrastructure with 70% having access to basic drinking water services and only 44% use basic sanitation services (Isukuru et al., 2024). Nigeria's performance in the Global Innovation Index (GII), the primary global innovation index, has generally shown poor performance with a poor ranking, within the bottom 10 countries, of 123rd in 2024 (Duarte & Carvalho, 2025). Nigeria's oil pipeline infrastructure faces significant challenges despite government and private sector efforts to sustain its operations and functions (Shao et al., 2025). These challenges include pipeline vandalism, crude theft, and damage which leads to huge financial loss and the effective implementation of surveillance programs to reduce environmental pollution (Bello & Nwaeke, 2023).

Objectives of the Study

The broad objective of this study is to examine the effects of Public-Private Partnership (PPP) expenditure on infrastructure development on economic growth of Nigeria from 2000 to 2024.

The specific objectives include to:

- i. establish the effects of Public-Private Partnership expenditure on road infrastructure development on real gross domestic product of Nigeria.
- ii. investigate the effects of Public-Private Partnership expenditure on electricity infrastructure development on real gross domestic product of Nigeria

Research Questions

- i. What are the effects of Public-Private Partnership expenditure on road infrastructure development on real gross domestic product of Nigeria?
- ii. What effects has Public-Private Partnership expenditure on electricity infrastructure development has on real gross domestic product of Nigeria?

Research Hypotheses

H₀₁: There is no significant relationship between Public-Private Partnership expenditure on road infrastructure development and real gross domestic product of Nigeria.

H₀₂: There is no significant relationship between Public-Private Partnership expenditure on electricity infrastructure development and real gross domestic product of Nigeria.

Review of Related Literature

Conceptual Review

Infrastructure and its Importance

In its literal sense, infrastructures are those fundamental facilities in an economy that facilitates the operations of the economy and are usually non-excludable (Fourie, 2006). The term "infrastructure" comes from Latin *infra* meaning "below," reflecting its role as the underlying framework upon which societies and economies are built. The words "infra" and "structure" are combined to form the word which refers to an interrelated collection of components that support an economy's structure towards achieving government fundamental macroeconomic goals and objectives (Ifoghere & Olele, 2024). The word infrastructure is used to describe permanent installations that are utilized for a long period of time, with the purpose of adding value to human existence and the economy in general (Du et al., 2022). Although the phrase has many different meanings in different sectors, it is most commonly used to refer to the fundamental infrastructure and systems that support a nation, city, or region, such as transportation and communication networks, water and power lines, schools, hospitals, etc. Infrastructure is also seen as the structural components

that enable and sustain production in order to lower production costs and, eventually, prices (Akomolehin et al., 2025). The study of Große (2023) defines infrastructure as an underlying base or supporting framework, as well as the facilities, tools, and services required for a nation, community, or organization to thrive and function optimally.

Furthermore, infrastructure is the foundational physical and organizational systems that support a country, city, or society's daily functioning and economic growth. It includes hard infrastructure, which are tangible assets like roads, bridges, airports, water supply, electrical grids, and telecommunications networks (Weijnen & Correljé, 2021). It also includes soft infrastructure, which are institutions and services such as education, healthcare, law enforcement, prison services and financial systems that maintain social and economic wellbeing (Kruk et al., 2018). These systems provide sustainable transportation, clean water access, communication, energy distribution, waste management, and public safety, which are essential for human wellbeing and economic growth (Wang et al., 2024). Investment in infrastructure drives economic development, creates jobs, reduces supply chain disruptions, and improves quality of life worldwide (Avorkeh et al., 2024).

Nigeria faces a massive infrastructure deficit, with current infrastructure stock at only 30% of GDP—less than half the 70% international benchmark (Ebehung & Ogar, 2025). To close this gap and support a population projected to reach 400 million by 2050, Nigeria needs an estimated \$2.3 to \$3 trillion in infrastructure investment by mid-century (Riahi et al., 2023). Key sectors requiring urgent development include energy (\$759B), transport (\$575B), housing (28 million-unit deficit), and digital infrastructure (Shao et al., 2025). Government funding is constrained by a low revenue-to-GDP ratio (~7%), making private sector participation and innovative financing models essential (Fay et al., 2021). Initiatives like the National Integrated Infrastructure Master Plan and Presidential Infrastructure Development Fund are underway but require accelerated support and investment. Closing Nigeria's infrastructure gap is critical to unlocking economic potential, improving quality of life, and ensuring sustainable development for future generations (Shao et al., 2025).

Road Infrastructure and its Importance

Road infrastructure refers to the entire network of fixed physical structures designed to facilitate the movement of people and goods, including roads, tunnels, bridges, and associated facilities like parking areas and interchanges (Afrin & Yodo, 2020). This essential public works system enables transportation, supports economic development, and underpins societal well-

being by ensuring efficient and safe travel from one geographical location to another (Kaiser & Barstow, 2022). Road infrastructure comprises two main categories of components: the road structure (subgrade, sub-base, base, and surface layers) and roadway elements (carriageway, shoulders, curbs, medians, and drainage systems). The roadways are the physical pathways such as national highways (Trunk A Road), state highways (Trunk B Road) and local feeder roads (Trunk C) managed by the local governments (Odehale, 2020). The bridges and tunnels are structures that are built to overcome obstacles like traffic jam, valleys, rivers or other roadways to maintain a continuous path. The interchanges are the complex structures that permit vehicles to switch from one road to another, improving connectivity and traffic. Ancillary facilities are component of road infrastructure that supports road use, including rest stops, parking lots, and terminals for public transportation like bus stops. These components work together to provide a durable, safe, and functional surface for traffic, managing loads, and facilitating movement and drainage (Sukur et al., 2023).

Electricity Infrastructure and its Importance

Electricity infrastructure refers to the entire system of networks, facilities and equipment required to generate, transmit and distribute electricity from its source to end-use consumers (Ayamolowo et al., 2019). It includes power plants (e.g., for wind, solar, or fossil fuels), high-voltage sub-stations and transmission lines that transmit power over long distances, and lower-voltage distribution lines that deliver it to homes and businesses. This complex network is essential for human development and economic growth.

Power generation involves those facilities that produce electricity, such as coal-fired, solar power generators, nuclear generators, gas-fired, hydro generators, wind power generators and geothermal generators. Power transmission networks are High-voltage lines, towers, and substations that transmit electricity from power plants to substations located closer to consumers. This is done at high voltages to minimize energy loss over long distances. Power distribution refers to the network of lower-voltage lines, transformers, and feeder lines that branch out from substations to deliver electricity directly to homes, businesses, and industrial users, while the supporting structures are the foundations, poles, wires, and associated equipment necessary to support the generation, transmission, and distribution systems.

Electricity infrastructure is crucial to every nation development process because it serves as an economic and social foundation through the provision of the fundamental power required for economic activities, domestic and industrial processes (Shi et al., 2025).

Furthermore, electricity is required for the crucial operation of all other private and public services, like water systems, telecommunications, healthcare, education and transportation (Ukoba et al., 2024). Every society's electricity infrastructure must adapt to increasing demand, as it grows and integrates renewable energy sources, shifting towards a more flexible and distributed system (Nwagu et al., 2025)

Empirical Literature

The study of Ifoghere & Olele (2024) examined the effects of public sector investment on infrastructure and Gross Domestic Product (GDP) growth using the PSS Autoregressive Distributed Lag Model (ARDL) techniques to focus on the causality between the related variables and found a positive long run relationship between public sector investment in infrastructure, fixed capital stock and GDP growth. The study of Nedozi et al., (2024) investigated the link between real gross domestic product (RGDP) and water infrastructure in Nigeria, using a multivariate cointegration model. The model established a long term interaction between the included variables and concluded that an indirect relationship exist between RGDP and water infrastructure stock, with growing infrastructure stock stimulating fixed capital investment and raising RGDP. Zhang & Cheng (2023) examined the effects of public infrastructure on economic growth, using real gross domestic product as proxy for growth. The core findings of the study revealed that electricity generation have direct influence on real GDP, with an elasticity of 0.2. This means that a percentage increase in electricity generation capacity will directly increase the RGDP by 0.2%. However, some of the results are not robust to replace the total road length by other selected infrastructure measures. The control for property rights was further introduced to test for institutional roles in the infrastructure-growth relationship. Incorporating this control preserves the indirect relationship through fixed capital stock while also revealing a strong positive direct association with elasticity ranging from 0.4 to 0.5. (Du et al., 2022) investigated the impact of economic and social infrastructure and tests the causality direction using the PSS ARDL technique and the existing relationship between private investment, infrastructure indicators and Gross Value Added (GVA). The study adopted the Vector Error Correction Model (VECM). The study revealed that social infrastructure influences private investment, economic infrastructure and GVA using physical measures of social and economic infrastructure that were built from classrooms and road data respectively. Adeniyi (2021) reported an ambiguous causal relationship between economic infrastructure, GVA and private investment. The study adopted the VECM model to establish the

influence of social infrastructure expenditure and private spending on GVA, with an elasticity of 0.06 and 0.02 respectively and found positive relationship between infrastructure growth and GVA. The study further tested for the probability of non-linear relationship that government expenditure on infrastructure initially boosts economic growth. The major findings revealed the existence of a positive relationship for economic and social infrastructure for investment in infrastructure in South Africa.

Particularly for Nigeria, several studies on government spending on infrastructure have emphasized on the rising tendency of public spending at the federal and state levels (Chiadika & Egbon 2024; Babatunde 2018; Okunlola et al., 2024). Others adopted the traditional Ordinary Least Square (OLS) estimation techniques to evaluate the effects of government spending on infrastructure on economic growth and find positive indicators (Onabote et al., 2023; Ahamba et al., 2024). However, little or no study has examined the aggregated and disaggregated effects of the core infrastructure development on real gross domestic product in Nigeria. Furthermore, literature on Public-Private Partnerships (PPPs) on infrastructure development as it influences Nigeria's economic growth process is scarce. Hence, this study aims to bridge the lacunae with policy implications.

It is not possible to overstate the importance and roles of infrastructure in a country's growth process. This study's examines the effects of Public-Private Partnerships (PPPs) on infrastructure development and economic growth, using a Vector Autoregressive approach that will support wise policy decisions.

Theoretical Framework

Infrastructure development theories examine how public and private investments in essential facilities, like roads, electricity, telecommunication, water and sanitation systems, drive social and economic progress by reducing cost of doing business, attracting both local and foreign investments and boosting productivity (Javid, 2019). This paper modifies the Infrastructure-Led Development Theory (ILDT) which emphasized that public spending on infrastructure triggers positive multiplier effects, enhances labour mobility and market access, which in turn promotes industrial growth and economic growth (Du et al., 2022). The theory also highlights infrastructure interactions with other sectors of the Nigerian economy, such as education, electricity, telecommunication, health water and sanitation, to create virtuous cycles of growth and development in Nigeria (Ebehung & Ogar, 2025).

Research Methodology

Nature and Sources of Data

Time series data on Public-Private Expenditure on Road Infrastructure (PERI), Public-Private Expenditure on Electricity Infrastructure (PEEI) and Real Gross Domestic Product (RGDP) for Nigeria, were sourced from the World Bank Development Indicator (WDI) and Central Bank of Nigeria (CBN) Statistical Bulletin from 2000 to 2024. PERI is measured using the Road Infrastructure Index (RII), a metric that assesses the quality and extent of Nigeria's road network, and calculated using data from the total road network as percentage to total land areas. PEEI is measured using the Global Electricity Development Index (GEDI), while RGDP is measured at constant price for inflation.

Methods of Data Analysis

The descriptive statistics conducted establish the normal distribution of the series around their mean. The Augmented Dickey Fuller (ADF) unit root test established the order of integration while the Johansen cointegration test established the long run relationship of the variables. The unrestricted Vector autoregressive (VAR) model established the dynamic relationships between the included variables. The VAR model permits the collective dynamic behaviour of time series variables without restrictions (Antonakakis et al., 2020). Our specified models contain 3 variables, expressed as a function of 3 lags of each variable plus a stochastic term (v_t). The variance decomposition tests quantify how much of the forecast error variance of the variables are explained by their own past shocks in relation to shocks to other variables in our model. The speed of adjustment to equilibrium of the variables from shocks, in the long run, was established through the Vector Error Correction (VEC) estimation. Diagnostic tests, like the VAR residual correlation LM test, were conducted to establish the absence of autocorrelation in our models.

Model Specifications

The VAR model is specified as:

$$\begin{aligned} \text{RGDP}_t = & \beta_0 + \beta_1 \text{RGDP}_{t-1} + \beta_2 \text{RGDP}_{t-2} + \beta_3 \text{RGDP}_{t-3} \\ & + \beta_{21} \text{PERI}_{t-1} + \beta_{22} \text{PERI}_{t-2} + \beta_{23} \text{PERI}_{t-3} \\ & + \beta_{31} \text{PEEI}_{t-1} + \beta_{32} \text{PEEI}_{t-2} + \beta_{33} \text{PEEI}_{t-3} + v_t \end{aligned} \quad (1)$$

$$\begin{aligned} \text{PERI}_t = & \beta_0 + \beta_1 \text{PERI}_{t-1} + \beta_2 \text{PERI}_{t-2} + \beta_3 \text{PERI}_{t-3} + \\ & \beta_{21} \text{PEEI}_{t-1} + \beta_{22} \text{PEEI}_{t-2} + \beta_{23} \text{PEEI}_{t-3} + \beta_{31} \\ & \text{RGDP}_{t-1} + \beta_{32} \text{RGDP}_{t-2} + \beta_{33} \text{RGDP}_{t-3} + v_t \end{aligned} \quad (2)$$

$$\begin{aligned} \text{PEEI}_t = & \beta_0 + \beta_1 \text{PEEI}_{t-1} + \beta_2 \text{PEEI}_{t-2} + \beta_3 \text{PEEI}_{t-3} + \\ & \beta_{21} \text{PERI}_{t-1} + \beta_{22} \text{PERI}_{t-2} + \beta_{23} \text{PERI}_{t-3} + \\ & \beta_{31} \text{RGDP}_{t-1} + \beta_{32} \text{RGDP}_{t-2} + \beta_{33} \text{RGDP}_{t-3} + v_t \end{aligned} \quad (3)$$

RGDP = Real Gross Domestic Product

PERI = Public-Private Expenditure on Road Infrastructure Development

PEEI = Public-Private Expenditure on Electricity Infrastructure Development

β and v_t represent the variable parameters and stochastic term, respectively.

The above specification is plausible, with the variables *a priori* stationary and ergodic. The error term v_t represents the parts of RGDP, PERI and PEEI not captured by or related to the past values of the variables.

Results and Discussion

Descriptive Statistics

Descriptive statistics presents a more precise idea of the distribution of the variables and examined the mean, median, maximum values, minimum values, standard deviation, skewness, kurtosis and Jarque-Bera statistic. Table 1 presents the descriptive statistic.

Table 1: Summary of Descriptive Statistics

	PERI	PEEI	RGDP
Mean	50.76101	58.07701	75.39431
Median	51.121211	59.31111	76.82111
Maximum	61.00000	64.20000	86.98000
Minimum	41.00000	50.70000	62.31000
Standard Dev.	4.895439	3.969192	7.298831
Skewness	-0.265634	-0.453947	-0.462431
Kurtosis	2.978931	2.815668	2.798075
Jarque-Bera	0.697199	1.826751	1.361933
Probability	0.519715	0.401279	0.506128
Sum	1269.000	1451.900	1884.830
Sum Sq. Dev.	572.5600	376.1856	1274.661
Observations	25	25	25

Source: Author's Computation

In table 1, the mean values of PERI, PEEI and RGDP are 50.76, 58.077 and 75.39 respectively. The mean of RGDP is higher but statistically not significant in influencing public-private partnership expenditure on road infrastructure development (PERI) and electricity infrastructure development (PEEI). The minimum and maximum values show that there are no data-entry error and outliers in the data. A comparison between PERI, PEEI and RGDP revealed that the data are normally distributed. The standard deviation values of 4.895439, 3.969192 and 7.298831 for PERI, PEEI and RGDP respectively show that the data are normally distributed from their respective means. The skewness is a measure of the asymmetry of the distribution of

variables around the mean. The skewness values of -0.265634, -0.453947 and -0.462431 for PERI, PEEI and RGDP respectively show that the data are normally distributed and skewed around their respective means. The kurtosis is a measure of the peakedness or flatness of the distribution. From table 1 the kurtosis values are close to 3, which imply the series are normally distributed around their means. Furthermore, the respective probability values are less than the respective Jarque-Bera values, which imply that the series are normally distributed around their means.

Unit Root Test

The unit root test results are reported in tables 2a and 2b at level and first difference respectively.

Table 2a: Augmented Dickey Fuller (ADF) Summary of Unit Root Test Results

Variables	ADF Test Statistics (At level)	Mackinnon Critical Values			Prob. (values)	Remark
		1%	5%	10%		
PERI	-4.0799	-3.8388	-2.9929	-2.6366	0.0047	Stationary
PEEI	-5.1780	-3.8388	-2.9929	-2.6366	0.0004	Stationary
RGDP	-1.9397	-3.8388	-2.9929	-2.6366	0.3534	Not Stationary

Source: Author's Computation

The unit root results presented in table 2a show that PERI and PEEI are both stationary at level because their respective probability values are lower than 0.05 and the absolute values of their test statistics are higher

than their critical values at 1%, 5% and 10% respectively. However, RGDP is not stationary at level because the probability value of 0.3534 is greater than 0.05 and the absolute value of the test statistic is lower

than the critical values at 1%, 5% and 10%. Table 2b presents the 1st difference of the unit root results.

Table 2b: Augmented Dickey Fuller (ADF) Summary of Unit Root Test Results

Variables	ADF Test Statistics (1 st Diff.)	Mackinnon Critical Values			Prob. (values)	Remark
		1%	5%	10%		
PERI	-4.9979	-4.5436	-3.6847	-3.3784	0.0041	Stationary
PEEI	-8.8877	-4.4163	-3.6321	-3.3586	0.0000	Stationary
RGDP	-2.3123	-2.6968	-1.9691	-1.6175	0.0351	Stationary

Source: Author's Computation

At 1st difference PERI, PEEI and RGDP are stationary because their respective probability values of 0.0041, 0.0000 and 0.0351 are less than 0.05. Furthermore, the absolute values of their respective test statistics are greater than their critical values at 5% and 10%. These conditions satisfy the application of the Johansen cointegration test.

Johansen Cointegration Test

Long Run Effects of Public-Private Partnership Expenditure on Road (PERI) and Electricity (PEEI) Infrastructure on Real Gross Domestic Product (RGDP)

Table 3a: Unrestricted Cointegration Rank Test (Trace)

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Values	Prob **

At Most 1 *	0.355213	17.72742	15.49572	0.0237
At Most 2 *	0.294522	7.992631	3.842466	0.0057

Trace test indicates 3 cointegration eqn(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

**MacKinnon-Haug-Michelis (1999) p-values

Table 3b: Unrestricted Cointegration Rank Test (Maximum Eigenvalue)

Hypothesized No. of CE(s)	Eigenvalue	Max. Eigen Statistic	0.05 Critical Values	Prob. **
None *	0.539274	17.77999	21.13263	0.1397
At Most 1 *	0.355213	9.736696	14.26561	0.2290
At Most 2 *	0.294531	7.991622	3.842476	0.0048

Max-eigenvalue test indicates no cointegration eqn(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

Results from the Johansen cointegration test show the existence of a long run relationship between PERI, RGDP and PEEI. The unrestricted cointegration rank test (table 3a) revealed that the trace statistic (35.49641, 17.72742 and 7.992631) exceed the respective critical values (29.79808, 15.49572 and 3.842466) at 5% level of significance. This indicates 3 cointegrating equations with respective probability values of 0.0098, 0.0237 and 0.0057 (less than 0.05) at 5% significant level. The values of the maximum Eigen statistic corroborate the trace statistic values of 3 cointegrating

equations. This implies the absence of a full rank because subtracting the number of cointegrating equations from the number of variables (PERI, RGDP and PEEI) is not equal to 0. This suggests that a linear combination of PERI, RGDP and PEEI is stationary, implying a long run equilibrium relationship among the variables. This further implies that the model is good and in functional form. The positive value of the log-likelihood indicates the absence of multicollinearity. These conditions satisfy the application of the VAR estimation to estimate the models parameters. Table 4 presents the VAR estimates of the variables

Table 4: Vector Autoregressive Estimates

	RGDP	PERI	PEEI
RGDP(-1)	0.553299* (1.23887) [2.31590]	0.266105 (0.26297) [1.01191]	0.405660 (0.32517) [1.24753]

Source: Author's Computation, 2025

From model 1, the Vector autoregressive (VAR) estimates show that real gross domestic product in the previous period, RGDP(-1) and expenditure on road infrastructure in the previous period, PERI (-1) are statistically significant in explaining changes in real gross domestic product in the current period (RGDP_t), with probability values less than 0.05. However, the other lag values of RGDP, PERI and PEEI are not statistically significant in explaining changes in RGDP for the current period. The coefficient of RGDP (-1) is 0.553299 implying that a 1 percent increase in real gross domestic product in the previous period causes a 55.3 percent increase in real gross domestic product in the current period. However, real gross domestic product in the current period has negative effects on road infrastructure expenditure in the previous period, with a coefficient of -0.335560. This implies that a 1 percent increase in real gross domestic product causes a 33.5 percent decrease in expenditure on road infrastructure in the previous period. The R-squared of 0.876482 implies that an 87.6 percent change in the endogenous variables is explained by the exogenous

variables. It remained strong after the adjustment for degree of freedom as 88 percent (Adjusted R-squared). Durbin Watson statistic of 1.90 implies a model free from autocorrelation.

From model 2, only the previous estimate of expenditure on road infrastructure PERI (-1) is statistically significant in explaining changes in PERI in the current period. However, expenditure on electricity infrastructure at 1 and 2 periods lag, PEEI (-1) and PEEI (-2), are not statistically significant in explaining changes in expenditure on road infrastructure (PERI). With positive coefficients of 0.090965 and 0.096300, a 1 percent increase in PEEI (-1) and PEEI (-2) respectively, brings about a negligible 9 percent increase in PERI in the current period.

From model 3, real gross domestic product at 2 lags period RGDP (-2), with a negative coefficient of -0.692288, is statistically significant in explaining changes in PEEI in the current period. This implies that a 1 percent increase in real gross domestic product brings about a 69 percent decrease in expenditure on electricity infrastructure in Nigeria.

VAR Variance Decomposition Test

The primary purpose of the variance decomposition test is to determine the degree of the forecast error variance of each endogenous variable is explained by shocks to other variables and to itself in the model.

Thus, it enables us to understand the contributions of each variable to the variability of other variables over time. Using a 5-year forecast period from the short run to the long run, the variance decomposition estimates are presented in tables 5a, 5b and 5c.

Table 5a: Variance Decomposition of RGDP

Periods	SE	RGDP	PERI	PEEI
1	2.694289	100.0000	0.000000	0.000000
2	3.253008	90.82342	9.105098	0.071482
3	3.871991	82.82618	14.31214	2.861682
4	4.312396	77.66377	20.02866	2.307566
5	4.609228	71.24483	26.84183	2.033336

Source: Author's Computation

From the results in table 5a, the rows represent the percentage of forecast error variance by RGDP. In the short run, a 100 percent of forecast error variance in RGDP is explained by the variable itself while about 71.24 percent of forecast error variance, on average, is explained in the long run. This implies that RGDP

strongly influences itself from the short to long run and is strongly endogenous in predicting itself. Other variables of the model (PERI and PEEI) do not have strong influence on RGDP. This means that PERI and PEEI, on average, have strong exogenous influence on RGDP both in the short and long run periods.

Table 5b: Variance Decomposition of PERI

Periods	SE	RGDP	PERI	PEEI
1	2.966104	0.270104	99.72990	0.000000
2	3.259514	3.920131	95.06294	1.016931
3	3.497145	8.103662	89.69104	2.205299
4	3.634812	13.70077	83.77403	2.525199
5	3.728654	17.61994	79.63181	2.748248

Source: Author's Computation

From the results in table 5b, the rows represent the percentage of forecast error variance by PERI. In the short run, a 99.73 percent of forecast error variance in PERI is explained by the variable itself while about 79.63 percent of forecast error variance, on average, is explained in the long run. This implies that PERI

strongly influences itself from the short to long run and is strongly endogenous in predicting itself. Other variables of the model (RGDP and PEEI) do not have strong influence on PERI. This means that RGDP and PEEI, on average, have strong exogenous influence on PERI both in the short and long run periods.

Table 5c: Variance Decomposition of PEEI

Periods	SE	RGDP	PERI	PEEI
1	3.667628	0.966098	1.965883	97.06802
2	4.056486	8.729305	5.754472	85.51622
3	4.303803	16.31149	6.311153	77.37736
4	4.386892	15.74822	7.024959	77.22682
5	4.421339	15.51370	7.443710	77.04259

Source: Author's Computation

From the results in table 5c, the rows represent the percentage of forecast error variance by PEEI. In the short run, a 97.06 percent of forecast error variance in PEEI is explained by the variable itself while about 77.04 percent of forecast error variance, on average, is explained in the long run. This implies that PEEI strongly influences itself from the short to long run and

is strongly endogenous in predicting itself. Other variables of the model (RGDP and PERI) do not have strong influence on PEEI. This means that RGDP and PERI, on average, have strong exogenous influence on PEEI both in the short and long run periods.

VAR Residual Serial Correlation LM Test

The VAR serial correlation LM tests assess whether the residuals (errors) of the estimated VAR models exhibit

serial correlation or are correlated with their own lag or past values. Table 6 presents the results of the serial correlation LM tests.

Table 6: VAR Residual Serial Correlation LM Tests

Null Hypothesis: No serial correlation at lag h						
Lag	LRE* stat	df	Prob.	Rao F-stat	df	Prob.
1	8.810558	9	0.4549	1.004814	(9, 26.9)	0.4601
2	5.551246	9	0.7839	0.598816	(9, 26.9)	0.7866
3	3.001879	9	0.9642	0.310222	(9, 26.9)	0.9647
Null Hypothesis: No serial correlation at lags 1 to h						
Lag	LRE* stat	df	Prob.	Rao F-stat	df	Prob.
1	8.810558	9	0.4549	1.004814	(9, 26.9)	0.4601
2	16.39480	18	0.5650	0.890810	(18, 23.1)	0.5939
3	51.47386	27	0.0031	3.045213	(27, 15.2)	0.0131

Source: Author's Computation

The VAR residual serial correlation LM test results in table 6 show that the probability values are all greater than 0.05 which suggest the result is non-significant and hence we accept the null hypothesis of no serial correlation or the absence of serial correlation in the residuals at lags 1, 2 and 3. This also suggests that the models adequately capture the time series dynamics or shocks in the long run. Thus, the VAR model correctly captures the time-dependent relationships in the series. Similarly, the LRE statistic captures the pattern of autocorrelation in the residuals of the model. The LR

statistic is non-significant due to their probability values all greater than 0.05 which implies the absence of serial correlation in our models.

Vector Error Correction (VEC) Estimation

The primary aim of the Vector Error Correction (VEC) estimates is to present the long-run equilibrium and the short-term dynamic adjustments when the variables deviate from their equilibrium. Table 7 presents the long-run and short-run adjustments of the variables to equilibrium.

Table 7: Vector Error Correction (VEC) Estimates

Cointegrating Eq	CointEq1		
PERI(-1)	1.000000		
RGDP(-1)	-1.199617 (0.32565) [-3.68379]		
PEEI(-1)	-4.042631 (0.98498) [-4.10429]		
C	274.7776		
Error Correction	D(PERI)	D(RGDP)	D(PEEI)
CointEq1	-0.181208 (0.10860) [-1.10692]	0.114015 (0.12376) [0.92125]	0.433656 (0.15149) [2.86262]

Source: Author's Computation

The upper segment of table 7 presents the error correction term signifying the long-run cointegrating relationships among the variables, while the lower segment presents the short-run coefficients. The error correction adjustment coefficient of -0.181208 implies that the previous period deviation from the long-run equilibrium is corrected in the current period with an adjustment speed of 18.12 percent. *Ceteris paribus*, in the long-run, a 1 percent change in the previous value of PERI will bring about a 100 percent increase in the error correction term. A 1 percent change in the previous value of the RGDP will cause the error correction term to decrease by 119.9 percent while a 1 percent change in the previous value of PEEI will cause the error correction term to also decrease by 404.2 percent.

Discussion of the Results/Policy Implications

Hypothesis One (PERI vs RGDP)

From the results obtained, real gross domestic product (RGDP) was positive and has insignificant impact on public-private partnership expenditure on road infrastructure (PERI). A 1 percent increase in 1 and 2 years lag period of RGDP only increases PERI by 26 and 2.9 percent respectively. This result underscores the declining value of the real gross domestic product due to inflation and internal policy missteps like expensive subsidies for road infrastructure and distorted exchange rate systems adversely influencing loans for road infrastructure in Nigeria (Okunlola et al., 2024).

Hypotheses Two (PERI vs PEEI)

The result shows public-private partnership expenditure on electricity infrastructure (PEEI) is not significant in explaining changes in public-private partnership expenditure on road infrastructure (PERI). Although positive, a 1 percent increase in PEEI has a negligible effect of 9 percent average increase on PERI. This implies that expenditure on road infrastructure has not significantly influenced expenditure on electricity infrastructure in Nigeria. Road and electricity infrastructure are complementary systems. The former allows for the efficient delivery of materials to build and maintain power grids, while electricity powers the transportation systems and supports businesses that benefit from good roads (Pandiyan et al., 2023).

Hypotheses Three (PEEI vs RGDP)

The result shows an inverse relationship between public-private partnership expenditure on road infrastructure and real gross domestic product of Nigeria. A 1 percent increase in RGDP, after a 2 period lag, brings about an average of 69.2 percent decrease in PEEI in Nigeria. This outcome reflects government and private sector lack of commitment in strengthening the moribund electricity infrastructure base in Nigeria (Kayode 2023). Despite huge

investment on infrastructure, the state of electricity infrastructure is abysmal. This is due to insufficient investment, aging and vandalized equipment, lack of skilled manpower and poor maintenance culture.

Conclusions

Public-Private Partnership expenditure on road infrastructure (PERI) is positively related with real gross domestic product (RGDP) in Nigeria. The moribund state of road and electricity infrastructure and rising inflation in Nigeria underscores the declining value of the real gross domestic product. Internal policy missteps like expensive subsidies for road and electricity infrastructure and distorted exchange rate systems have adversely influenced loans for road and electricity infrastructure in Nigeria within the period of study. Investment efforts by the government and private sector on infrastructure development have negligible effects on real gross domestic product due to government and private sectors' lack of commitment, corruption and mismanagement of public-private funds for infrastructure development. Road and electricity infrastructure are complementary systems. The former allows for the efficient delivery of materials to build and maintain power grids, while electricity powers the transportation systems and supports businesses that benefit from good roads.

Recommendations

- i. To achieve sustainable solutions to the poor road and electricity infrastructure in Nigeria, a more holistic, diverse and innovative financing models, like infrastructure bonds and green bonds, should be adopted to supplement government and private sector financing.
- ii. Project management and regulatory processes should be simplified, digitized. This will permit the reduction in bureaucratic hurdles and expedite project actions.
- iii. The government should create the enabling environment for advanced technologies, digital platforms and smart infrastructure systems to promote project management and improve service delivery of infrastructure facilities. Furthermore, adopting comprehensive regional infrastructure plans that utilize data and mapping technologies will monitor roads and electricity conditions.
- iv. The government should adopt broader policies and community initiatives, through sustainable practices for long-term viability, promote alternative transport systems and make more investments in renewable energy, to reduce the pressure on the road network and power systems respectively. Communities and stakeholders should be engaged in the planning and execution process to ensure projects align with their needs and promotes a culture of shared responsibility for infrastructure.

Abstract

This study examines the impact of innovation management on the performance of selected small and medium-scale enterprises (SMEs) in Lagos Island, Nigeria. The research specifically investigates how product, process, marketing, and organizational innovations influence SME performance within a competitive business environment. Using a descriptive survey design, data were collected from SME owners and managers through structured questionnaires. The data were analysed using both descriptive and inferential statistics. The findings reveal that all four dimensions of innovation management significantly and positively affect the performance of SMEs, with marketing and organizational innovations having the strongest influence. The study concludes that effective innovation management practices enhance the competitiveness and sustainability of SMEs. It recommends that SME owners and policymakers should prioritize innovation-driven strategies to improve operational efficiency, market positioning, and overall firm performance.

Keywords: Innovation Management, Product Innovation, Process Innovation, Marketing Innovation, Organizational Innovation, Small and Medium Enterprises (SMEs), Firm Performance,

Introduction

Small and Medium Enterprises (SMEs) are pivotal to economic growth, employment generation, and poverty alleviation, particularly in developing economies like Nigeria (Ali, 2021; Sokoto & Abdullahi, 2013). Their adaptability and flexibility allow them to thrive in dynamic markets, yet their performance is often hindered by challenges such as limited resources, competition, and inadequate innovation adoption (Bushe, 2019). Innovation, broadly categorized into product, process, marketing, and organizational innovation (OECD, 2005), has been identified as a critical driver of SME performance. Product innovation, which involves enhancing or introducing new goods and services, directly impacts customer satisfaction and sales growth through competitive advantage (Mdoe et al., 2024; Okafor et al., 2024a; Okafor et al., 2024b). Process innovation, on the other hand, improves operational efficiency and product quality, leading to higher profitability (Akgün et al., 2019). Marketing innovation, through strategies like digital outreach and rebranding, expands market reach (Muithya et al., 2021), while organizational innovation fosters

internal efficiencies and adaptability (Polder et al., 2010).

Empirical studies underscore the significance of these innovation types. For instance, Akoma et al., (2023) found that proactive innovation strategies significantly enhance SME performance in Nigeria's manufacturing sector, while Issau et al. (2021) highlighted market innovation as a key predictor of success in Ghanaian SMEs. Similarly, Mdoe et al., (2024) demonstrated that Tanzanian SMEs leveraging product and process innovations reported improved financial returns. Despite these findings, inconsistencies persist in the literature. For example, Waziri et al. (2023) observed that while product and process innovations boosted SME performance in Yobe State, Nigeria, marketing and organizational innovations had negligible effects. Such disparities suggest contextual and methodological gaps, particularly in Nigeria's diverse business environments.

Lagos State, Nigeria's commercial hub, presents an ideal setting for this study. Home to over forty percent of Nigeria's SMEs (SMEDAN, 2021), Lagos offers a vibrant yet competitive ecosystem where

innovation is critical for survival. The state's dense population, infrastructural challenges, and high competition amplify the need for SMEs to adopt innovative practices (Taiwo et al., 2022). However, despite Lagos' economic significance, limited research has explored how innovation management specifically influences SME performance in this region, creating a gap this study aims to fill.

The performance of SMEs in Nigeria remains suboptimal despite their economic importance. Recent data indicate a 3.5% decline in the sector's contribution to GDP (SMEDAN, 2021), with high failure rates, up to forty percent within five years of operation (Awotoye & Singh, 2017). Scholars attribute this to poor innovation adoption, financial constraints, and inefficient management (Bolarinwa & Okolocha, 2016; Jeptoo et al., 2017). While innovation is widely recognized as a performance enhancer (Erjona, 2015; Gil-Garcia et al., 2014), empirical evidence remains inconsistent. For instance, Akoma et al. (2023) found that risk-taking and proactiveness negatively moderated innovation-performance relationships in Ogun State, whereas Ukpabio et al. (2019) reported positive effects of process and organizational innovations in Southwestern Nigeria.

Notably, similar studies have been conducted in other Nigerian regions but not Lagos. Nwankwo and Ezeibe (2021) examined innovation's impact on SMEs in Onitsha, revealing significant financial performance gains, while Waziri et al. (2023) focused on Yobe State, highlighting divergent effects across innovation types. These regional studies emphasise the need for localized insights, as outcomes may vary due to Lagos' unique socio-economic dynamics, including higher competition, regulatory pressures, and infrastructure deficits (Pulka et al., 2021; Mamman & Abuga, 2020).

Therefore, given Lagos status as Nigeria's business epicentre, understanding how innovation management drives SME performance here is critical. This study addresses the gap by investigating the interplay between product, process, marketing, and organizational innovations and the performance of Lagos Island SMEs, offering context-specific recommendations to bolster the sector's sustainability.

Aim and Objectives of the Study

The overall aim of this study is to undertake a comprehensive analysis of innovation management and performance of selected SMEs. To achieve this central aim, the following specific objectives were pursued.

- Investigate the relationship between product innovation and performance of selected SMEs.
- Examine the relationship between process innovation and performance of selected SMEs.
- Determine the relationship between marketing innovation and performance of selected SMEs.

- Investigate the relationship between organizational innovation and performance of selected SMEs.

Research Hypotheses

Given the above research questions, and objectives, the following hypotheses are formulated:

- i. H₀₁: There is no significant relationship between product innovation and performance of selected SMEs.
- ii. H₀₂: There is no significant relationship between process innovation and performance of selected SMEs.
- iii. H₀₃: There is no significant relationship between marketing innovation and performance of selected SMEs.
- iv. H₀₄: There is no significant relationship between organizational innovation and performance of selected SMEs.

Literature Review

Theoretical Underpinning

Schumpeter's Theory of Innovation

Schumpeter's theory of innovation provides a robust theoretical foundation for understanding the critical role of entrepreneurial innovation in driving SME performance and economic development. At its core, Schumpeter (1934) conceptualized innovation as the fundamental mechanism of economic change, with entrepreneurs serving as the key agents who introduce "new combinations" of production factors that disrupt market equilibriums and propel economic progress. This perspective remains highly relevant for contemporary SMEs, particularly in dynamic business environments like Lagos Island, where innovation serves as both a survival strategy and competitive differentiator (Muithya et al., 2021; Kim et al., 2018). Schumpeter identified five distinct forms of innovation that closely align with modern innovation typologies: introducing new products, implementing novel production methods, opening new markets, securing new supply sources, and reorganizing industrial structures (Schumpeter, 1934; Lazzarotti et al., 2011). These innovation types manifest in today's SME sector as product innovation (new or improved offerings), process innovation (enhanced production/delivery methods), marketing innovation (new market approaches), and organizational innovation (business model restructuring), all of which have been empirically linked to improved SME performance (OECD, 2005; Hanaysha et al., 2022b).

The theory's concept of "creative destruction" - where innovation continuously revolutionizes economic structures by rendering previous technologies and systems obsolete - holds particular significance for SMEs in competitive markets (Schumpeter, 1947). This process creates both challenges and opportunities; while established firms may struggle with disruption, agile SMEs can

leverage innovation to gain market share and improve performance metrics such as profitability, market positioning, and operational efficiency (Asad, 2018; Matekenya & Moyo, 2022). Schumpeter's assertion that innovation serves as the primary driver of business profits and economic growth (Schumpeter, 1947) finds support in contemporary research demonstrating positive correlations between various innovation types and SME performance indicators including sales growth, cost reduction, and quality improvement (Abdilahi et al., 2017).

However, the theory's exclusive focus on innovation as the sole determinant of economic progress has been critiqued for overlooking other critical factors that influence SME performance (Gintis, 1990). The innovation-performance relationship is moderated by contextual variables such as access to financing, regulatory environments, institutional support, and market conditions (Tariq et al., 2019; Vittori et al., 2022). This limitation is particularly evident in developing economy contexts like Nigeria, where SME innovation adoption often faces unique constraints including resource limitations, infrastructure deficits, and skills gaps (Waziri et al., 2023). Furthermore, while Schumpeter emphasized radical, discontinuous innovations, contemporary research shows that incremental innovations often yield more sustainable performance improvements for resource-constrained SMEs (Cherrafi et al., 2018; Matekenya & Moyo, 2022).

For Lagos Island SMEs, Schumpeter's theory provides valuable insights but requires contextual adaptation. The region's vibrant yet competitive business ecosystem, characterized by rapid market changes and intense competition, creates ideal conditions for Schumpeterian innovation to flourish (Akoma et al., 2023). However, the theory must be integrated with other perspectives to account for local realities such as informal sector dynamics, infrastructure challenges, and access to innovation-supporting institutions. Recent studies in similar contexts have demonstrated how Schumpeterian innovation principles, when adapted to local conditions, can significantly enhance SME performance through improved product offerings, streamlined processes, and innovative marketing strategies (Waziri et al., 2023; Mdoe et al., 2024). This study builds on Schumpeter's foundational work while incorporating these contextual considerations, offering a more comprehensive framework for understanding innovation-performance dynamics in Lagos Island's unique SME sector.

Empirical Literature Review

Innovation management has been widely acknowledged as a crucial driver of growth and competitiveness among small and medium-sized enterprises (SMEs). Empirical studies across different contexts have examined how various dimensions of innovation (product, process,

marketing, and organizational) affect SME performance. The following section synthesizes empirical findings from previous research to identify trends, contextual differences, and methodological gaps, thereby aligning the discussion with the focus on innovation management and the performance of SMEs in Lagos Island, Nigeria.

Akoma et al. (2023) investigated the moderating effect of risk-taking and proactiveness on the relationship between innovation and performance among manufacturing SMEs in Ogun State, Nigeria. Using a survey of 504 SME owners and managers, and hierarchical regression analysis, the study revealed that both risk-taking and proactiveness significantly moderated the innovation-performance relationship. The findings implied that higher levels of risk-taking and proactive orientation enhance firm performance. The authors recommended that SME managers adopt proactive and risk-tolerant strategies to boost competitiveness within Nigeria's dynamic business environment.

Similarly, Issau et al. (2021) examined how innovation orientation dimensions influence SME performance in Ghana's manufacturing sector. Employing the PLS-SEM approach with data from 346 SMEs, the study found that market innovation had a significant positive impact on performance, whereas process and product innovations were not statistically significant. The study emphasized the importance of enhancing market innovation and called for more empirical research focusing on innovation orientation dimensions within African SMEs.

In Tanzania, Mdoe, Mfinanga, and Kanire (2024) explored the effect of various forms of innovation on SME performance using an Ordered Logistic Model on data from 162 SMEs. Their findings showed that product innovation enhances sales and customer satisfaction, process innovation improves return on equity and product quality, and marketing innovation drives sales growth. Organizational innovation was also found to enhance production quality and returns, highlighting the multifaceted nature of innovation in improving SME performance. The study recommended policy support in the form of grants, subsidies, and advisory services to promote innovation-driven growth among SMEs.

Kazinguvu (2017) emphasized the strategic aspect of innovation management in SMEs, focusing on how cultivating an innovative culture supports firm performance. Through qualitative interviews with selected SMEs, the study revealed that strategic innovation requires an open culture that encourages risk-taking, learning from failures, employee empowerment, and curiosity. The author argued that innovation should be embedded in organizational behaviour and leadership to ensure sustained performance.

Twaliwi and Isaac (2017) assessed the effect of innovation on SME performance in Gwagwalada-

Abuja using data from 348 SMEs analysed with the OLS method. The study found that product, process, and marketing innovations all had significant positive effects on performance. However, it noted that SMEs in the area were not consistently adopting innovative practices. The authors recommended that SMEs embrace new innovation methods to improve efficiency and competitiveness.

Tuan et al. (2016) also found a positive relationship between organizational innovation and firm performance, concluding that higher levels of innovative activities lead to improved performance outcomes. In a related study, Boachie-Mensah and Acquah (2015) examined 243 SMEs in Sekondi-Takoradi, Ghana, and found that product innovation, though positive, was not statistically significant to performance. Despite this, innovation explained over 51% of changes in firm performance, suggesting its central role in SME growth.

Maldonado-Guzmán et al. (2018) conducted a large-scale study of 1,400 Latin American family businesses and established that product, process, and management system innovations significantly contributed to improved products, production processes, and management efficiency. However, the study overlooked market innovation and the moderating role of government regulation, presenting conceptual and contextual gaps for future research.

Similarly, Mung'ora (2020) found that product, process, marketing, and organizational innovations were strong predictors of performance in SACCOs in Nyeri County, Kenya. The study highlighted the need for causal research designs, which the current study adopts, to establish more robust cause-effect relationships. Musyoki and Peter (2020) supported this conclusion in their study of 10,000 SMEs in Nairobi County, which revealed that market innovation significantly influences both firm performance and entrepreneurial growth.

Omwanza and Jagongo (2019) reviewed the role of organizational innovation among Kenyan microfinance institutions and concluded that firms with higher levels of organizational innovation tend to perform better. However, the study only considered product, process, and organizational innovation, leaving out market innovation and financial performance, which introduced a conceptual gap. Likewise, Kiveu et al. (2019) examined SMEs in Nairobi and found that process, marketing, and organizational innovations were vital for competitiveness, whereas product innovation had no significant impact. The study's focus on competitiveness rather than performance introduced a contextual and conceptual gap relevant to the current research.

In Mexico, Valdez-Bocanegra et al. (2020) established that management, process, marketing, and product innovations contribute significantly to competitiveness in the manufacturing sector. However, the study did not directly assess

performance outcomes and ignored moderating factors such as government regulation. Similarly, Muithya et al. (2021) found that market and financial innovations enhance performance among Kenyan microfinance institutions but identified conceptual and contextual limitations due to the study's narrow sectoral scope.

Jiang et al. (2018) explored the impact of government regulation on innovation performance among Chinese technology manufacturers. The study found that stringent regulations negatively affected innovation performance, while supportive regional policies promoted innovation. This underscores the importance of institutional environments in shaping innovation outcomes. Waziri, Ayuba, and Muhammad (2023) confirmed the positive effects of product and process innovation on SME performance in Yobe State, Nigeria, though marketing and organizational innovations were not significant predictors. Their findings suggest that innovation remains a key performance driver, albeit with varying levels of importance across innovation types. Nwankwo and Ezeibe (2021) also found that product, process, market, and administrative innovations significantly affect the financial performance of SMEs in Onitsha. They recommended that government support SMEs through incentives and credit guarantees to encourage innovation-driven growth. Similarly, Ukpabio, Oyeibisi, and Siyanbola (2019) analysed 305 Nigerian manufacturing SMEs and found that while all dimensions of innovation correlated positively with performance, process and organizational innovations had the strongest effects. Ndesaulwa and Kikula (2016) provided a comprehensive review of innovation research in Africa and noted that empirical studies on innovation and SME performance remain limited on the continent. Their study emphasized the need for more context-specific research, as most existing evidence originates from Western and Asian economies. Finally, Ismanu and Kusmintarti (2019) studied handmade batik SMEs in East Java, Indonesia, and found that continuous innovation in product design and production enhances competitiveness and firm performance. The authors concluded that SMEs must prioritize innovation as a long-term strategy to sustain performance in a dynamic market.

Summary of Findings and Gap

Recent studies (2021–2024) emphasize the contextual nature of innovation's impact, with findings varying by region and sector. While product and process innovations consistently show positive effects (Akoma et al., 2023; Waziri et al., 2023), marketing and organizational innovations yield mixed results (Issau et al., 2021; Kiveu et al., 2019). Earlier research (2008–2016) laid the groundwork but often lacked regional diversity, emphasising the need for more African-focused studies. This review highlights gaps in Lagos-

specific research, justifying the current study's focus on innovation-performance dynamics in Lagos Island SMEs.

Methodology

Research Design

This study adopted descriptive research design to evaluate the impact of innovation management on the performance of selected SMEs at Lagos Island. Descriptive research design is also called survey research design. Asika (1991) postulated that research design means the structuring of investigation aimed at identifying variables and their relationships to one another. Kerlinger (1973) also explained that research design is used for the purpose of obtaining data to enable the researcher test hypothesis or answer research questions. Descriptive research design clearly specifies who and what are to be measured. The researchers used descriptive research design which is also called Survey design.

Population of the study

Population of the study refers to the entire group of people of interest that the researcher wishes to investigate. Mugenda & Mugenda (2012) defines population as an entire group of individual or objects having common observable characteristic. The study population comprises of all the SMEs at Lagos Island.

Sampling Procedure and Sample size

As the target population of the study. The sampling method used for this research is a combination of

convenient and quota sampling techniques, which was adopted to get information on innovation management and performance of SMEs in Lagos Island. Due to time and resources constraint, a total of 120 SMEs were selected and questionnaire were distributed to the manager or owners of the selected SMEs.

Data Collection Instrument and Validation

Primary data was used for the purpose of collection of information for the research and the instrument used was questionnaire. Questions were structured in line with the Hypotheses and other relevant research questions using a five-point Likert Scale measurement which ranks responses on a scale of 1 to 5, the ranking of the Likert scale for each item is given below:

Strongly Disagree (1) = SD, Disagreed (2) = D, Undecided (3) = U, Agree (4) = A, Strongly Agree (5) = SA.

The validity of the constructs in the questionnaire was ascertained using the face validity and content validity. First and foremost, the questions were framed in such a manner that they are easily understood and they convey their sense and purpose to the respondents. The face validity was done by giving out copies of the questionnaire to academia who have a sufficient knowledge and experience regarding this topic to ensure that each item is measuring what is intended to be measured, and to avoid any ambiguity and complexity in the phrasing of the questions.

Reliability of Research Instrument

Reliability relates to precision; in other words, it is used to check the consistency and stability of the questionnaire. Reliability of a test instrument concerns its ability to produce similar results when repeated measurements are made under identical conditions. The way one assesses reliability depends

on what is being measured. The reliability of the instrument was measured by the Cronbach's alpha coefficient. Some scholars have suggested that the values of all indicators or dimensional scales should be above the least recommended value of 0.60, this is shown in the table below;

Table 3.1 Different Levels of Reliability

Level of Reliability	Alpha Ranges
Very Good Reliability	0.8 to 0.95
Good Reliability	0.7 to 0.8
Fair Reliability	0.6 to 0.7
Poor Reliability	Less than 0.6

Source: Sekaran and Bougie, (2016).

Tables 3.1 above shows the interpretation of Cronbach alpha coefficient, which is used to describe the internal consistency of scales, obtained from the Likert scale. The higher the score, the more reliable the generated scale is.

Results from the Pilot Study

Pilot test was carried out before the actual study to evaluate the reliability of the research instrument and

reduce the possible problems or inaccuracy that the questionnaires might have. Thirty (30) questionnaires were used for pilot test and were distributed to employees of SMEs in Ikeja, Lagos state. The Statistical Package for the Social Sciences (SPSS) software was used to run the reliability test of the 30 set of questionnaires. The result of reliability test is shown below;

Table 3.2 Reliability Statistics Test Result

Variable	Dimensions	Sum of Items	Cronbach Alpha
Dependent Variable	SMEs Performance	7	0.76
Independent Variables	Product innovation	5	0.87
Independent Variables	Process innovation	5	0.72
Independent Variables	Marketing innovation	5	0.73
Independent Variables	Organizational innovation	5	0.85

Source: Authors Calculation (2025)

From table 3.2 above, it can be concluded that all variables (Independents and Dependent) fall within the range of 0.7 to 0.95; hence the research questionnaire is considered to have a good reliability.

Method of Data Analysis

Data Analyses in Management Sciences Research, two tools would be used; descriptive statistical tool and inferential statistical tool. The descriptive statistical tools are used for classifying data, this study made use of frequency tables, and percentages for descriptive statistics. While inferential statistical tool, Pearson correlation coefficient was used for testing hypotheses.

Data Presentation and Analysis

This section deals with the presentation and analysis of data collected from the respondents during the

study. Data are organized into tables and presented in simple percentages to find answers to research questions. The statistical test used for testing the hypothesis for the study is Pearson correlation coefficient. Pearson correlation coefficient analysis was adopted for the study to establish the significant relationship between the variables.

However, the convenient and quota sampling method was used to select the respondents on which the questionnaire was administered. A total of 120 questionnaire was distributed, retrieved from the respondents, and analysed. The statistical analysis of all data gather during the survey was carried out and presented in this section alongside hypotheses testing.

Answers to Research Questions

Section A: Demography details of the respondents

Table 4.1 Demographic Characteristics of the Respondents

S/N	VARIABLE	DEMOGRAPHICS	FREQUENCY	PERCENTAGE
1.	Sex	Male	70	58.3
		Female	50	41.7
		Total	120	100
2.	Age	18-25	22	18.3
		26-35	33	27.5
		36-45	35	29.2
		46-55	19	15.8
		56 and above	11	9.2
		Total	120	100
3.	Education Qualification	SSCE	20	16.7
		OND/NCE	58	48.3
		HND/B.Sc	30	25.0
		M.Sc and above	12	10.0
		Total	120	100
4.	Position the Business	Owner	41	34.2
		Manager	79	65.8
		Total	120	100
5.	Years of Operation	Less than 1 year	10	8.3
		1-5 years	61	50.8
		6-10 years	27	22.5
		over 10 years	22	18.3
		Total	120	100

Sector of Operations	Manufacturing	47	39.2
	Retail/Wholesale	44	36.7
	Services	24	20.0
	Others	5	4.2
	Total	120	100.0

Source: Authors computation (2025)

The demographic characteristics presented in Table 4.1 offer important insights into the profile of respondents involved in the study on innovation management and SME performance in Lagos Island. The gender distribution indicates that a larger proportion of the respondents are male (58.3%) compared to female (41.7%), suggesting that men slightly dominate SME ownership or management roles in the area. In terms of age, the respondents are relatively diverse, with the majority falling between the ages of 26 and 45 years (56.7%), reflecting an active and economically productive age group often associated with entrepreneurial activities. The presence of younger respondents (18–25 years, 18.3%) and older individuals (above 46 years, 25%) also highlights a mix of generational participation in SME operations.

Educational qualifications among the respondents reveal that a majority possess at least a diploma (OND/NCE, 48.3%), followed by HND/B.Sc. holders (25%). Only 10% have attained postgraduate education, while 16.7% hold only a secondary school certificate (SSCE). This distribution suggests a fairly educated respondent base, with most having the minimum formal training required to understand and possibly implement innovative practices in business. Regarding their positions within the businesses, a significant majority (65.8%) are managers rather than owners (34.2%), indicating that the information obtained in the survey largely reflects operational

Table 4.2: Correlation Analysis

		Product Innovation	SMEs Performance
Product Innovation	Pearson Correlation	1	0.668**
	Sig. (2-tailed)		0.000
	N	120	120
SMEs Performance	Pearson Correlation	0.668**	1
	Sig. (2-tailed)	0.000	
	N	120	120

Source: Authors computation (2025) **. Correlation is significant at the 0.01 level (2-tailed). Table 4.2 presents the results of the correlation analysis conducted to test Hypothesis 1, which examines the relationship between product innovation and the performance of selected SMEs in Lagos Island.

management perspectives rather than ownership viewpoints.

The duration of operation of the SMEs shows that most businesses (50.8%) have been in existence for between 1 to 5 years, suggesting a concentration of relatively young enterprises that may still be in their growth phase. A smaller portion (18.3%) has operated for over a decade, which could provide valuable insights from more established firms. The sectoral distribution reveals that the SMEs sampled cut across various industries, with manufacturing (39.2%) and retail/wholesale trade (36.7%) being the most represented. Service-based businesses account for 20%, while the remaining 4.2% fall into other unspecified categories. This spread demonstrates the heterogeneity of SMEs in Lagos Island and allows for a more generalized understanding of how different forms of innovation impact performance across various sectors.

Test of Hypotheses

The Pearson Correlation Coefficient was employed in this study for testing hypotheses 1, 2, 3 and 4.

Hypothesis 1

H₀₁: There is no significant relationship between product innovation and performance of selected SMEs.

H₁₁: There is a significant relationship between product innovation and performance of selected SMEs.

The Pearson correlation coefficient between product innovation and SMEs performance is 0.668, with a p-value of 0.000, which is significant at the 0.01 level (2-tailed). This result indicates a moderately strong positive correlation between the two variables. In practical terms, it suggests that as SMEs engage more in product innovation, such as introducing new products, updating existing ones, and responding to

customer feedback, their performance in terms of sales, customer base, profitability, and other business outcomes tends to improve significantly. Since the p-value is less than 0.01, the result is statistically significant, and we reject the null hypothesis (H_0) that states there is no significant relationship between product innovation and SMEs performance. We accept the alternative hypothesis (H_1) that there is a significant relationship between product innovation and performance. This finding supports the idea that product innovation is a critical driver of competitive

advantage and growth for SMEs in Lagos Island, reinforcing the importance of continuous product development in ensuring business success in a dynamic market environment.

Hypothesis 2

H₀₂: There is no significant relationship between process innovation and performance of selected SMEs.

H_{i2}: There is a significant relationship between process innovation and performance of selected SMEs.

Table 4.3: Correlation Analysis

		Process Innovation	SMEs Performance
Process Innovation	Pearson Correlation	1	0.652**
	Sig. (2-tailed)		0.000
	N	120	120
SMEs Performance	Pearson Correlation	0.652**	1
	Sig. (2-tailed)	0.000	
	N	120	120

Source: Authors computation (2025)

Correlation is significant at the 0.01 level (2-tailed). Table 4.3 presents the correlation analysis for Hypothesis 2, which investigates the relationship between process innovation and the performance of selected SMEs in Lagos Island.

The Pearson correlation coefficient between process innovation and SMEs performance is 0.652, with a p-value of 0.000, which is statistically significant at the 0.01 level (2-tailed). This indicates a strong positive relationship between process innovation and firm performance. In other words, as SMEs increasingly adopt innovative production methods, update delivery processes, automate tasks, and implement cost-saving process improvements, their overall performance improves as well.

Given that the p-value is less than 0.01, we reject the null hypothesis (H_{02}), which states that there is no significant relationship between process innovation

and SMEs performance. Instead, we accept the alternative hypothesis (H_{i2}), confirming that there is a significant relationship.

This result underscores the importance of efficient internal operations and continuous process improvement for SMEs, suggesting that firms that prioritize process innovation tend to perform better in terms of profitability, competitiveness, and customer satisfaction. It reinforces the need for SMEs in Lagos Island to invest in modern technologies and operational strategies to enhance their performance outcomes.

Hypothesis 3

H₀₃: There is no significant relationship between marketing innovation and performance of selected SMEs.

H_{i3}: There is a significant relationship between marketing innovation and performance of selected SMEs.

Table 4.4: Correlation Analysis

		Marketing Innovation	SMEs Performance
Marketing Innovation	Pearson Correlation	1	0.733**
	Sig. (2-tailed)		0.000
	N	120	120
SMEs Performance	Pearson Correlation	0.733**	1
	Sig. (2-tailed)	0.000	
	N	120	120

Source: Authors computation (2025) **. Correlation is significant at the 0.01 level (2-tailed).

Table 4.4 presents the correlation analysis for Hypothesis 3, which examines the relationship between marketing innovation and the performance of selected SMEs in Lagos Island.

The Pearson correlation coefficient between marketing innovation and SMEs performance is 0.733, with a p-value of 0.000, which is statistically significant at the 0.01 level (2-tailed). This indicates a strong positive correlation, suggesting that as SMEs adopt innovative marketing strategies, such as creative promotions, social media use, rebranding, and new pricing tactics, their performance significantly improves.

Since the p-value is less than 0.01, we reject the null hypothesis (H_{03}) that there is no significant relationship between marketing innovation and SMEs performance. We accept the alternative

hypothesis (H_{33}), confirming that a significant relationship exists.

This finding highlights the powerful role of marketing innovation in enhancing SME performance. It implies that firms that effectively innovate in how they promote, present, and position their products are more likely to attract customers, grow their market base, and achieve higher sales and profitability. Therefore, marketing innovation is a key strategic lever for performance improvement among SMEs in Lagos Island.

Hypothesis 4

H₀₄: There is no significant relationship between organizational innovation and performance of selected SMEs.

H_{i4}: There is a significant relationship between organizational innovation and performance of selected SMEs.

Table 4.5: Correlation Analysis

		Organizational Innovation	SMEs Performance
Organizational Innovation	Pearson Correlation	1	0.649**
	Sig. (2-tailed)		0.000
	N	120	120
SMEs Performance	Pearson Correlation	0.649**	1
	Sig. (2-tailed)	0.000	
	N	120	120

Source: Authors computation (2025) Correlation is significant at the 0.01 level (2-tailed).

Table 4.5 presents the correlation analysis for Hypothesis 4, which investigates the relationship between organizational innovation and the performance of selected SMEs in Lagos Island.

The Pearson correlation coefficient is 0.649, with a p-value of 0.000, indicating a strong positive and statistically significant relationship between organizational innovation and SME performance at the 0.01 level (2-tailed). This suggests that SMEs that implement organizational innovations such as adopting new management practices, restructuring internal processes, encouraging employee ideas, and forming strategic partnerships tend to achieve better performance outcomes.

Given that the p-value is less than 0.01, the result is statistically significant, and we reject the null hypothesis (H_{04}), which states that there is no significant relationship between organizational innovation and SMEs performance. We therefore accept the alternative hypothesis (H_{14}), confirming that a significant relationship exists.

This finding emphasizes the role of internal organizational adaptability and strategic leadership in driving SME success. It implies that innovation embedded in organizational culture, structure, and management practices contributes meaningfully to improved competitiveness, employee productivity, and overall business performance in SMEs across Lagos Island.

Discussion of Findings

The present study examined the relationship between different dimensions of innovation management, namely, product innovation, process innovation, marketing innovation, and organizational innovation, and the performance of selected SMEs in Lagos Island. The findings reveal that all four innovation dimensions have statistically significant and positive correlations with SME performance. These results align with, and in some cases extend, previous research discussed in Chapter Two.

i. Product Innovation and SME Performance

The correlation analysis revealed a strong positive relationship ($r = 0.668$) between product innovation and SME performance, indicating that SMEs that frequently develop or improve their products tend to perform better. This aligns with findings by Farida and Nuryakin (2021) and Vladimirov (2016), who affirmed that product innovation enhances customer satisfaction and drives business growth. Similarly, Oduro (2019) found that product innovation led to increased market share and competitiveness among Ghanaian SMEs. In the Lagos Island context, the high mean score for

introducing new or improved products ($M = 4.16$) further reinforces this pattern. However, while studies like Boachie-Mensah and Acquah (2015) reported statistically insignificant effects of product innovation in certain settings, the current study provides robust evidence of its impact, reflecting Lagos Island's dynamic and highly competitive market environment where product differentiation is crucial.

Process Innovation and SME Performance

A positive and significant correlation ($r = 0.652$) was also observed between process innovation and SME performance. This is consistent with the literature, particularly the studies of Hanaysha et al. (2022b) and Asad (2018), which demonstrated how process optimization contributes to cost efficiency, operational effectiveness, and improved customer service. The strong agreement among respondents in this study ($M = 4.40$ for cost-reducing process changes) suggests that Lagos SMEs are increasingly leveraging process innovation to improve productivity. These findings also resonate with Schallmo et al. (2018) and Kimathi et al. (2019), who highlighted the transformative potential of process innovation in resource-constrained environments. Despite challenges such as infrastructure deficits (noted by Tariq et al., 2019), Lagos SMEs appear to be navigating these hurdles through strategic and incremental process improvements, aligning with Matekenya and Moyo's (2022) call for lean innovation strategies.

Marketing Innovation and SME Performance

Marketing innovation recorded the strongest correlation with SME performance ($r = 0.733$), underscoring its critical role in the success of Lagos Island SMEs. This finding supports empirical work by Musawa and Ahmad (2018) and Mabenge et al. (2022), who found that innovative marketing strategies significantly enhance competitiveness, customer acquisition, and profitability. The adoption of creative promotions, social media, and rebranding efforts, reflected in high mean scores in this study, demonstrates how SMEs in Lagos are actively using marketing innovation to differentiate themselves. This contrasts with studies like Rosli and Sidek (2013), which downplayed the effect of marketing innovation in certain regions due to environmental factors. However, the vibrant and urbanized business climate of Lagos Island may amplify the relevance of marketing innovation, providing an explanation for the strong observed relationship.

Organizational Innovation and SME Performance

Finally, the correlation between organizational innovation and SME performance ($r = 0.649$) confirms that internal structural changes, new management practices, and collaboration contribute meaningfully to performance. This finding mirrors the work of Expósito and Sanchis-Llopis (2019) and Maldonado-Guzmán et al. (2018), who emphasized the role of organizational innovation in enhancing internal processes and sustaining competitive advantage. In the current study, while the cultural integration of innovation within firms scored modestly ($M = 3.05$), practices such as using new management methods and inter-firm partnerships received strong agreement, pointing to an emerging shift toward more agile and responsive organizational setups among SMEs. This supports Boubakary's (2021) view that internal innovations, especially in structure and practice, are fundamental to business growth.

Collectively, the findings of this study reinforce the OECD's (2005) multidimensional innovation framework and provide empirical validation for Schumpeter's theory of innovation, which posits that innovation is a key driver of firm growth and market disruption. Moreover, the study extends the Resource-Based View (RBV) and Dynamic Capabilities Theory by demonstrating how Lagos SMEs utilize internal capabilities and adaptive strategies to innovate and sustain performance in a volatile business environment. While some previous studies reported inconsistent or context-dependent results, such as Waziri et al. (2023) who found weak effects of marketing and organizational innovation in Yobe State, the strong positive correlations observed in Lagos Island may reflect the distinct entrepreneurial ecosystem, urban infrastructure, and consumer dynamics unique to the region.

Conclusion and Recommendations

This study investigated the influence of innovation management on the performance of selected SMEs in Lagos Island. A total of 120 questionnaire was distributed to either owners or managers of the selected SMEs, retrieved from the respondents, and analysed. The retrieved questionnaire was then coded and analysed using statistical package for social sciences (SPSS). From the results, it was observed that product innovation, process innovation, marketing innovation, and organizational innovation positively impact the performance of selected SMEs in Lagos Island. Based on the findings of this study, the following recommendations are proposed to enhance innovation practices and improve the performance of SMEs in Lagos Island:

- i. Promote Continuous Product Innovation: SME owners and managers should invest more in developing new

products and improving existing ones to remain competitive and responsive to changing customer needs. This may involve using customer feedback mechanisms, trend analysis, and prototype testing.

Adopt Efficient Process Innovations: SMEs should regularly assess and improve their operational processes to reduce costs and enhance efficiency. Government agencies and industry associations can support this by organizing training and workshops on lean manufacturing, automation, and digital tools.

Strengthen Marketing Innovation Strategies: Since marketing innovation had the strongest relationship with performance, SMEs are encouraged to adopt creative promotional strategies, leverage social media platforms, and explore modern branding techniques to attract and retain customers.

Enhance Organizational Innovation Culture: SMEs should foster a culture that encourages innovation at all levels of the organization. This includes empowering employees to contribute ideas, restructuring internal systems for better efficiency, and engaging in strategic partnerships with other firms and institutions.

Policy Support and Incentives: Government agencies, such as SMEDAN and BOI, should provide targeted support through tax incentives, grants, and capacity-building programs to enable SMEs to overcome financial and technical barriers to innovation.

Publication Date: 2025/11/28

Abstract

This study investigates the impact of transformational and servant leadership styles on organisational change, specifically technological and attitudinal changes, within the Delta State Civil Service. Using a cross-sectional survey design, data were collected from 39 deputy and assistant directors across 11 ministries and directorates, achieving an 88.64% response rate. Regression analysis revealed that transformational leadership significantly influences technological change ($\beta = 0.276$, $p = 0.031$, $R^2 = 0.120$) and employees' attitudinal change ($\beta = 0.343$, $p = 0.002$, $R^2 = 0.229$), rejecting the null hypotheses. Servant leadership significantly predicts attitudinal change ($\beta = 0.349$, $p < 0.001$, $R^2 = 0.295$) but not technological change ($\beta = 0.188$, $p = 0.106$, $R^2 = 0.069$). Findings highlight transformational leadership's critical role in driving digital adoption and attitudinal shifts, while servant leadership excels in fostering positive employee attitudes. The study extends prior research by providing empirical evidence in a sub-national Nigerian context, addressing slow technological adoption and attitudinal resistance. Recommendations include targeted leadership training to enhance change outcomes. Future studies could explore longitudinal designs or mediators like organizational culture.

Keywords: *Transformational Leadership, Servant Leadership, Technological Change, Attitudinal Change, Organisational Change*

Introduction

Change is a prominent attributes of organizational, civil and personal life. Lewis (2011) notes that change serve as means of addressing many important challenges related to policy, governance, rule of law, philosophy, distribution of information, rights, and resources; challenges of efficiency, effectiveness, quality, and competitiveness; and challenges hinged on shared values, understanding, and cooperation. Accordingly, these challenges cut across many sectors of the society including private sector organization upon which human depend for goods, services, and the basis of societal economy; public sector organizations that run humans' community, state, national and international governance; and non-governmental or non-profit organizations that promote community and leisure activities (Lewis, 2011). While change is a regular characteristics of organizational life, and indeed, an inseparable aspect of nature, yet, most public sector organizations, particularly the civil service in most developing countries have failed to embrace and adapt to changes (especially technological, structural and leadership related changes) influencing operational and administrative activities. Buttressing, Van der Voet

and Vermeeren, (2017) opine that while organizations in their quest of increasing efficiency often introduce changes, however, in reality, the anticipated outcome is barely achieved.

Observably, over the years, Nigeria as a country, have accepted global practices as well as, has been receptive in the implementation of technological advances in various sphere of human endeavors, however, its civil service is yet to fully accept and apply the technological changes, characterizing work processes and operations in the twenty-first century. Corroborating, Oyelade (2021) revealed that the structure of Nigeria's civil service represents a stone aged institution where professionals have spent more than twenty years in service without adding value to the development of the nation's infrastructure, or implementing policies that promote inclusion ..., as there exist many holes in the civil service structure, spanning across its organizational structure to the basic standard operational procedure. In a world that is rapidly digitalized, Nigerian civil service still highly engaged on manual filling as well as paper-based authorization in most of its operations. Although, over time, several policies and frameworks such as the

National Strategy for Public Service Reform, SERVICOM, Federal Civil Service Strategy and Implementation Plan, digitization and E-government policies have been initiated in ensuring change within the civil service, yet, antiquated and outdated processes of service delivery still persist; indicating resistance to change within in the civil service. Ekang (2014) averred that the civil service is slow to perceive change and even slower to adopt it. Amjad and Rehman (2018) posit that resistance to change is often rooted in uncertainty, loss of control, perceived threats to job security, or inadequate communication from management. These issue is considered a states'-wide phenomenon, characterizing various ministries, departments, agencies and parastatals of government in Nigeria.

Specifically, Delta state, over the past two decades have witness significant change initiative aimed at transforming the public sector. For instance, in the year 2000, an information technology enablement project tagged "e-Delta", designed on a wide spread introduction of computers to conduct daily work activities and a world class business application was introduced, aimed at enhancing service delivery in Ministries, Departments and Agencies of Government. In addition, report indicate that the present administration of Delta state, in a bid to improve competency and professionalism within the state civil service, have institutionalized regular training and retraining programme, aimed at promoting a culture of continuous learning within the civil service (Adon, 2025). Delta state civil witnessed changes in relation to restructuring of ministries and the creation/merging of directorates; also there was a move from project approach to programme approach in the implementation of budgets as well as in project monitoring from project inception to project delivery (Odigbo, 2024). In spite of these technological, attitudinal and structural changes initiated in Delta state's civil services over the years, yet, ministries, departments and agencies recorded very minimal changes.

Data obtained, indicates that the spirit of innovation has not been brought to bear in registry and registry practices in Delta state's Ministries, Departments and Agencies. Almost every registry has continued to operate manually (94.83%). Only a paltry 1.72% is digitalized (Odigbo, 2024). Similarly, it was revealed that regarding changes in organizational structure, 39.66% have changed while 56.90% recorded their MDAs as remaining intact (Odigbo, 2024). Also, there are reports of poor work ethics and poor work attitude characterizing Delta state civil service (Ahiuma-Young, 2018). Scholars have made consistent attempt aimed at understanding the challenges and causes of slow organizational change initiatives. While, Agbeyeke

(2015) in a study identified infrastructural constraints, financial constraints, institutional and human capacity constraint as challenges of the efficiency of technological changes in civil service; Adeleye et al. (2025) highlighted that visionary leadership play important role in driving innovation and technology adoption in the Nigerian public sector. Asghar (2010) in Ochuko and Ayo-Balogun (2020) agree on the point that the role of leadership/leader is very significant while managing organizations or addressing the problem of organizational change. While leadership issues, and a lack of awareness and motivation have been revealed to complicate change process in organization, however, with committed leadership, adequate training, and a deep understanding of the challenges, organizations can navigate the complexities of change and achieve their desired outcomes (Odulaja et al., 2023).

Gilbert (2025) notes that rigid leadership is one of the key drivers of change resistance in organization. Akbar (2017) describes leadership as the process of social influence that consciously directs others to structure and influence the activities of a group or organisation to achieve one or more goals. Leaders must have the ability to influence, direct or motivate the behaviour of other people or groups to achieve desired goals. While these abilities are known and exhibited by all leaders in organizations, however, Adeleye et al. (2025) note that transformational leaders who exhibit visionary thinking, intellectual stimulation, and personalized support tend to create environments that are more receptive to new ideas. Furthermore, transformational leadership has been recognized to excels in environments that require innovation, change management, and long-term vision (Adeleye et al., 2025). On the other hand, Aruoren and Erhuen (2023) in a study on leadership and organizational outcomes in parastatals and ministries in Delta State, found that servant leadership strongly predicted perceived organizational support and job satisfaction among employees; perceived support partially mediated the relationship between servant leadership and satisfaction. Accordingly, in servant leadership style, leadership emerges through humility, empathy, active listening, persuasion, stewardship, and nurturing community-cantered on serving team needs ahead of individual ambition (Adeleye et al., 2025).

Although, scholars (Musa & Bello, 2023; Purnomo et al., 2024; Adeleye et al., 2025; Gilbert, 2025; Gustyan & Anggarani, 2024; Ochuko & Ayo-Balogun, 2020) have been examined organizational change in various sectors, geographical locations and cities, relying on several antecedent factors believed to have influence desired change, however, none has been done in ascertaining the effect of leadership (transformational and servant leadership) on organizational change, particularly in Delta state civil service. Against this

background this study examined the effect of leadership on organizational change in Delta state civil service.

Objective of the study

The aim of this study is to examine the effect of leadership on organizational change in Delta state civil service. Specifically, the study: (1) Assess the effect of transformational leadership style on technological change in Delta state civil service; (2) ascertain the influence of transformational leadership style on employees' attitudinal changes in Delta state civil service; (3) investigate the effect of servant leadership style on technological change in Delta state civil service; (4) examine the influence of servant leadership style on employees' attitudinal changes in Delta state civil service.

Research hypotheses

From these objectives, the following hypothesis were stated in their null form to guide the study. Ho₁: Transformational leadership style does not have any significant effect on technological change in Delta state civil service.

Ho₂: Transformational leadership style does not have any significant influence on employees' attitudinal changes in Delta state civil service.

Ho₃: Servant leadership style does not have any significant effect on technological change in Delta state civil service.

Ho₄: Servant leadership style does not have any significant influence on employees' attitudinal changes in Delta state civil service.

Literature Review

The concept of leadership

Over the years, several attempts have been made in explaining the concept of leadership, although, there is lack of universally acceptable definition on the concept of leadership. This, Stogdill (1974) affirms, by stating that there are almost as many definitions of leadership as there are persons who have attempted to define the concept. Kumar cited in Anyango (2015) views leadership as a process by which a person influences others to accomplish an objective and directs the organization in a way that makes it more cohesive and coherent. These are accomplished through the application of leadership attributes, such as beliefs, values, ethics, character, knowledge, and skills. Anbazhagan and Kotur (2014) defined leadership as a process of influencing others to get the job done effectively over sustained period of time, geared towards accomplishment of organizational set goals. In other words, leadership is an art of influencing followers or employees' behavior and performance towards the achievement of group goals. Accordingly,

a leader must be able to influence others to adapt to change, particularly a positive change, doing so will motivate and ultimately lead their followers to a new and promising future (Summerfield, 2014). While a good leader does not force their employees but rather encourages and leads by example and has integrity, which ultimately benefits all stakeholders, contrarily, bad leaders exhibits characteristics that are misguided. These characteristics are often exhibited in different behavior in leading followers referred to as leadership style.

Cuadrado et al (2007) in Anyango (2015) described leadership style as consistent set of behaviors /patterns, proposing two dimensions in leaders' behavior, structure initiation which includes task-oriented leaders and consideration which includes relation-oriented leaders. Kuncoro (2021) state that leadership style is a person's way (leadership) of influencing other people or their subordinates to be willing to do what they want to achieve organizational goals. Accordingly, leadership styles have evolved over the decades to embrace novel concepts like servant, transformational and transactional leadership styles (Lynch, 2016). These styles of leadership (Transformational and transactional leadership), later extended to the Full Range of Leadership theory. Accordingly, the full range of leadership theory, identifies the concept of three distinct leadership styles - transactional, transformational, and laissez-faire (Udovita, 2020). The foundation of the full ranged leadership model emanates from the works of Bass (1985). However, Hartnell and Leroy (2019) opined that most of the leadership found on literature falls within the classical type of leadership such as change-oriented, task-oriented and relationship-oriented) or the moral type of leadership (ethical, servant leader and authentic).

Transformational leadership style

Accordingly, transformational leadership focuses on satisfying the basic and higher-order needs of followers through inspiration to achieved desired goals (Ghasabeh et al., 2015). It can be described as a process that changes and transforms individuals through an exceptional form of influence that moves followers to accomplish more than what is usually expected. Transformational leadership emphasizes that leaders should act as change agents who initiate and implement the new directions to employees based on innovative ideas and vision (Kim & Yoon, 2015). This implies that employees are empowered in making change in the organization by the leaders to ensure that the innovative ideas possessed by employees are of great substance for the growth and success of the organization.

Bass and Avolio (1997) conceptualized transformational leadership manifesting through

idealized attributes, idealized behavior, intellectual stimulation, inspirational motivation, and individualized consideration. Idealized influence refers to the behaviors of a transformational leader that evokes his or her followers' trust, admiration, respect and their desires to emulate the leader. Inspirational motivation as a component of transformational leadership is concerned with the leader communicating and expecting high performance and output from their followers. The leaders offer importance and challenge that spurs and moves crafted by the workers. In such manner, the leaders advance cooperation, eagerness, and idealism in their devotees by including them in a positive vision of things to come and by conveying elevated standards that supporters need to accomplish (Gomes, 2014). In addition, Transformational leaders stimulate their followers' efforts "to be innovative and creative by questioning assumptions, reframing problems, and approaching old situations in new ways" (Avolio & Bass, 2002). Lastly, manifesting through individualized consideration. In applying individualized consideration, a leader considers many elements related to an individual employee's temperament, talents, level of formal education, occupational training, and experience.

Servant leadership style

Accordingly, servant leadership emerged as a transformative approach to organizational leadership and places the needs of followers first and emphasizes ethical behavior, empowerment, and community building (Canavesi & Minelli, 2022). Greenleaf (2023) in Adeleye et al (2025) view servant leadership as a philosophy and practice of leadership in which the leader's primary role is to serve others first, focusing on followers' growth, well-being, and empowerment rather than asserting traditional positional authority. This leadership style emphasizes humility, empathy, active listening, persuasion, stewardship, and nurturing community, for the purpose of serving team needs ahead of individual ambition. Madison and Eva (2025) revealed that the servant leadership sharply with autocratic or power-oriented models and reorients leadership toward ethical service and people-centered practice. The servant leadership model enunciates a reciprocal social exchange: leaders who genuinely serve their followers foster commitment and trust, which in turn drives performance and ethical alignment.

Organizational change

Change refers to a system of continuous transformation that takes place in one or more organisational domains, such as organisational technology, structure and human resources (Sofat et al., 2015). George and Jones (2011) in Musa & Bello (2023) define organisational change as the adoption of innovative ideas or behaviours by an

organisation in response to external and internal pressures. External pressure could result from improvements in technology and pressure from stakeholders outside the organisation, such as government or industry competitors. Internal pressure for change can come from individuals such as shareholders, management or employees. Khosa et al., (2015) opined that organizational change involves; mission changes, strategic changes, operational changes (including structural changes), technological changes, changes in staff attitudes and behaviours, countering the resistances of various employees of the organisation and aligning them with the strategic directions of the organization.

Technological changes

Technological change involves invention (development of new technology), innovation (application and commercialization), and diffusion (spread and adoption) - resulting in more effective or efficient tools, services, and systems (Adeleye et al., 2025). It does not only involves digitizing an ongoing process but implies a fundamental reconfiguration of institutional operations and service delivery models in public sector settings. In Nigeria, digital transformation in governance involves integrating technologies such as e-government systems, online portals, and digital identity mechanisms to combat corruption, improve efficiency, and expand access (Adesola, 2024).

Attitudes toward change

Liao et al. (2012) in Musa and Bello (2023) view work attitudes are a set of behaviour and judgements about work, and these behaviours and thoughts are redirected in the form of work effort and organisational commitment. In the workplace, employee attitude reflects how an employee feels about their job, work environment, resources, policies, and procedures (Mohan & Sudarsan, 2020). Employees attitude towards change is often shaped by intrinsic and extrinsic factors such as work-related values self-efficacy, threat assessment, perception of stress, work-related attitudes, skills development, fear of the consequences of change, and career advancement; perceived social support, perceived organisational support, leadership style (transformational and transactional), organisational fairness, leadership style (transformational and transactional), manager involvement and so on (Musa & Bello, 2023).

Empirical reviews

Adeleye et al (2025) carried out on leadership style and technological change in selected Ministries, Departments, and Agencies (MDAs) in Nigeria. Specifically, it focused on three leadership dimensions: transformational, transactional, and servant leadership.

A structured questionnaire, based on a 5-point Likert scale ranging from "Strongly Disagree" to "Strongly Agree," was developed and administered electronically via Google Forms. Data were collected from 380 purposively selected respondents across 15 MDAs, all of which met inclusion criteria related to ICT capacity and regulatory compliance. Descriptive statistics were used to analyse the data via SPSS. The findings revealed that transformational leadership had the most significant positive effect on technological change, followed by transactional leadership. Servant leadership showed the least direct effect.

Iqbal et al. (2023) conducted a study in Pakistani IT firms comparing transformational and servant leadership in predicting innovative behaviour, including the use of new digital tools and processes. The objective was to determine whether servant leadership explains incremental variance in innovative behaviour above transformational leadership. A quantitative survey of 338 IT employees was conducted using PLS-SEM. Findings showed that servant leadership not only exerted a significant direct influence on innovative behaviour but also explained incremental variance beyond transformational leadership. The mechanisms differed: affective commitment mediated transformational leadership, whereas creative self-efficacy mediated servant leadership's impact on innovation.

Gilbert (2025) explores the underlying causes of employee resistance to organizational change and evaluates strategic interventions within Nigeria's hospitality sector. Grounded in Lewin's Change Management Theory (Unfreeze-Change-Refreeze), the research adopts a qualitative approach using semi-structured interviews with 20 employees across various hospitality organizations. The findings reveal that resistance stems from factors such as fear of job loss, inadequate communication, lack of employee involvement, and poor leadership engagement. Strategic responses, including inclusive communication, participatory decision-making, and targeted training, were found to mitigate resistance and enhance change readiness.

Bello and Aide (2023) conducted a study examining the effect of transformational leadership on organizational growth and ICT progress at Adamawa State Polytechnic, Yola, Nigeria. The objective was to assess how transformational leadership dimensions—such as intellectual stimulation, individualized consideration, and inspirational motivation - influence employees' readiness and performance in an increasingly digital work environment. The study employed a descriptive quantitative survey design, targeting management, academic, and non-academic staff, with a sample size of 100 respondents selected using stratified random sampling. Findings revealed

that transformational leadership crucially accelerates organizational growth and progress, especially in the ICT era, by fostering employee engagement, innovation, and performance.

Purnomo et al (2024) analyze the role of value-based leadership in shaping an organizational culture that supports sustainable change. The research method employed is a literature review with a qualitative approach using descriptive analysis. Data for this research were gathered from Google Scholar within the timeframe of 2004-2024. The findings indicate that leaders with a value-based approach play a crucial role in shaping an organizational culture that supports sustainable change. They are responsible for communicating and reinforcing core values, developing a focused vision, building trust and team member engagement, as well as promoting continuous learning. Gustyan and Anggarani (2024) examine the role of leadership in the organizational change process, both as a facilitator and as an influencer. Literature review and theoretical analysis were combined with qualitative research methodology in this study. It was found that a good leadership style and paying attention to the school culture that has developed is very influential in creating positive change. Teachers, Staff and students can be inspired and motivated by transformational leadership, as they engage in decision making and take ownership of change under participative leadership. Planning, directing, and implementing necessary changes becomes easier with strategic leadership.

Methodology

The study adopted quantitative approach as well as cross-sectional survey design. Cross-sectional survey aids the elicitation of primary data on particular problems and gives the researcher first-hand information on the subject studied. The population of the study involves ministries and directorates in Delta state civil service. Accordingly, there exist a total of 35 mainline Ministries and Directorates in Delta state civil service (Odigbo, 2024). Hence, the study targeted deputy and assistant directors of various departments in all 35 ministries and directorates of Delta state civil service. While the study unit of analysis is on the macro level, it becomes difficult to access the permanent secretaries and directors of each ministry, hence, two deputy and two assistant directors were targeted mainly from several departments (units) in 8 ministries and 3 directorates (ministry of works, environment; land, survey and urban development; commerce and industry, housing, energy, water resources, economic planning; directorates of local government affairs, science and technology, and special duties). This amount to 44 elements constituting the study unit of analysis. Census was adopted in which the entire 44 elements of the target population were

studied. Questionnaire structures in Likert's five-point scale was used for data collection. For test of reliability of the scale, Cronbach's alpha coefficients Data were analyze using descriptive and inferential statistics. Specifically, regression analysis was used in testing the hypotheses.

Results and Discussion

Out of the 44 questionnaires distributed to deputy and assistant directors across selected ministries and

directorates in the Delta State Civil Service, 39 were returned complete and free from errors, yielding a response rate of 88.64%. This sample size was sufficient for the quantitative analysis, aligning with the study's cross-sectional survey design and regression techniques. The demographic profile of respondents, summarized in Table 1, provides insight into the target population.

Table 1: Demographic Characteristics of Respondents (N=39)

Demographic Variable	Category	Frequency	Percentage (%)
Gender	Male	25	64.1
	Female	14	35.9
Age Group	18-25	2	5.1
	26-35	8	20.5
	36-45	15	38.5
	46-55	10	25.6
	56 and above	4	10.3
Years of Service	Less than 5 years	5	12.8
	5-10 years	10	25.6
	11-15 years	12	30.8
	16-20 years	8	20.5
	Above 20 years	4	10.3
Position	Deputy Director	20	51.3
	Assistant Director	19	48.7
Department/Ministry	Ministry of Works	4	10.3
	Ministry of Environment	3	7.7
	Ministry of Land, Survey and Urban Development	4	10.3
	Ministry of Commerce and Industry	3	7.7
	Ministry of Housing	3	7.7
	Ministry of Energy	4	10.3
	Ministry of Water Resources	3	7.7
	Ministry of Economic Planning	4	10.3
	Directorate of Local Government Affairs	4	10.3
	Directorate of Science and Technology	3	7.7
	Directorate of Special Duties	4	10.3

Source: Research Output, 2025

The demographic analysis shows a male-dominated sample (64.1%), consistent with the gender distribution in senior civil service roles in Nigeria. The largest age group, 36-45 years (38.5%), suggests a mid-career cohort with significant exposure to organisational changes. The majority of respondents had 11-15 years of service (30.8%), indicating a balanced tenure mix

that likely influences their perceptions of leadership and change. The near-equal split between Deputy Directors (51.3%) and Assistant Directors (48.7%) aligns with the study's target population. The departmental distribution is evenly spread, with no single ministry or directorate dominating, ensuring diverse representation across the targeted entities.

Table 2: Descriptive Statistics for Key Variables (N=39)

Variable	Mean	Standard Deviation (SD)
Transformational Leadership Style (TL)	3.73	0.66
Servant Leadership Style (SL)	3.72	0.74
Technological Change (TC)	4.50	0.53
Employees' Attitudinal Change (EAC)	4.71	0.47

Source: Research Output, 2025

The descriptive statistics indicate positive perceptions across all variables. Transformational leadership style (TL) has a mean of 3.73 (SD = 0.66), suggesting moderate to high agreement on its inspirational and visionary aspects, with some variability in perceptions. Servant leadership style (SL) shows a similar mean of 3.72 (SD = 0.74), reflecting consistent perceptions of empathy and empowerment, though with slightly higher variability. Technological change (TC) has a higher mean of 4.50 (SD = 0.53), indicating strong endorsement of digital

tools' benefits, with relatively low dispersion. Employees' attitudinal change (EAC) records the highest mean of 4.71 (SD = 0.47), implying widespread openness to behavioral shifts and high consensus among respondents.

Hypotheses Testing

To test the hypotheses, simple linear regression analyses were conducted using ordinary least squares (OLS) in SPSS, with leadership styles as independent variables and dimensions of organisational change as dependent variables. The results are summarized in Table 3.

Table 3: Regression Analysis Results for Hypotheses (N=39)

Hypothesis	Independent Variable	Dependent Variable	Beta Coefficient	P-value	R ²	Result
Ho1	Transformational Leadership Style (TL)	Technological Change (TC)	0.276	0.031	0.120	Rejected
Ho2	Transformational Leadership Style (TL)	Employees' Attitudinal Change (EAC)	0.343	0.002	0.229	Rejected
Ho3	Servant Leadership Style (SL)	Technological Change (TC)	0.188	0.106	0.069	Not Rejected
Ho4	Servant Leadership Style (SL)	Employees' Attitudinal Change (EAC)	0.349	<0.001	0.295	Rejected

Source: Research Output, 2025

The regression analysis for Ho1 shows that transformational leadership significantly predicts technological change (beta = 0.276, $p = 0.031$, $R^2 = 0.120$), indicating that TL explains 12% of the variance in TC. The positive beta suggests that a one-unit increase in TL leads to a 0.276-unit increase in TC, rejecting Ho1. For Ho2, TL significantly influences EAC (beta = 0.343, $p = 0.002$, $R^2 = 0.229$), explaining 22.9% of the variance and rejecting Ho2, highlighting TL's stronger role in attitudinal shifts. For Ho3, servant leadership's effect on TC is positive but non-significant (beta = 0.188, $p = 0.106$, $R^2 = 0.069$), failing to reject Ho3, suggesting limited direct impact on technological adoption. For Ho4, SL significantly predicts EAC (beta = 0.349, $p < 0.001$, $R^2 = 0.295$), explaining 29.5% of

the variance and rejecting Ho4, indicating SL's strong influence on attitudinal changes.

Discussion of Findings

Ho1: Transformational Leadership Style and Technological Change

The rejection of Ho1 confirms that transformational leadership significantly enhances technological change in the Delta State Civil Service. This aligns with Adeleye et al. (2025), who found transformational

leadership to be the most effective in driving technological adoption in Nigerian MDAs, due to its focus on visionary thinking and intellectual stimulation. Similarly, Bello and Aide (2023) reported that transformational dimensions like inspirational

motivation accelerate ICT progress in public institutions. A recent study in Ethiopian public universities further supports this, showing transformational leadership's role in fostering innovation in tech-heavy environments (Yismaw et al., 2024). The moderate R^2 suggests other factors, such as infrastructural constraints noted by Agbeyeke (2015), may also influence tech adoption, but TL's impact remains critical in overcoming resistance to digital tools like e-government systems.

Ho2: Transformational Leadership Style and Employees' Attitudinal Change

The rejection of Ho2 indicates that transformational leadership significantly fosters positive attitudinal changes among employees. The higher R^2 underscores TL's stronger influence on attitudes compared to technological change. This finding corroborates Bass and Avolio (1994), who emphasize TL's ability to inspire and motivate followers toward organizational goals. In the Nigerian context, Adeleye et al. (2025) noted TL's role in enhancing employee readiness for change. A 2024 study in the Lebanese public sector further aligns, linking transformational traits to higher commitment in bureaucratic settings (Harb & Sidani, 2024). The result suggests that TL's inspirational and individualized consideration components effectively counter attitudinal resistance, as noted by Gilbert (2025), fostering openness to new work practices.

Ho3: Servant Leadership Style and Technological Change

The failure to reject Ho3 indicates that servant leadership does not significantly influence technological change, with a low R^2 suggesting minimal explanatory power. This aligns with Adeleye et al. (2025), who found servant leadership less impactful on tech outcomes compared to transformational styles, likely due to its focus on relational rather than visionary aspects. Iqbal et al. (2023) noted that servant leadership's influence on innovation requires mediators like self-efficacy, not direct tech adoption. A 2025 study on tech-driven development similarly positioned servant leadership as secondary in rapid digital transitions (Chepkutwo, 2025). Infrastructural barriers, as highlighted by Agbeyeke (2015), may further limit SL's tech impact in Delta's civil service, where manual processes dominate (Odigbo, 2024).

Ho4: Servant Leadership Style and Employees' Attitudinal Change

The rejection of Ho4 confirms that servant leadership significantly enhances employees' attitudinal changes, with the highest R^2 among the hypotheses. This supports Aruoren and Erhuen (2023), who found

servant leadership predicts job satisfaction and support in Delta State parastatals through empathy and community-building. Gustyan and Anggarani (2024) similarly noted servant-like leadership's role in motivating attitudinal shifts in educational settings. A recent review further endorses SL's effectiveness in cultivating positive attitudes in public administration (Ogunyemi et al., 2024). The strong effect suggests that SL's focus on humility and empowerment fosters a supportive environment, reducing resistance to change and enhancing employee commitment.

Conclusion and Recommendations

Conclusion

The study confirms that leadership styles significantly influence organisational change in the Delta State Civil Service. Transformational leadership drives both technological and attitudinal changes, as evidenced by the rejection of Ho1 and Ho2, addressing the slow digital adoption and attitudinal resistance noted in prior studies. Servant leadership, while not impactful on technological change (Ho3 not rejected), excels in fostering attitudinal shifts (Ho4 rejected), highlighting its relational strengths. These findings underscore the need for tailored leadership approaches to optimize change outcomes in public sector settings.

Recommendations

The study made the following recommendations based on the study's results and findings:

- Implement mandatory transformational leadership training for senior officials, focusing on visionary strategies to accelerate digital tool adoption, such as e-government systems, to address the low digitization rate.

- Develop workshops to enhance transformational leadership behaviours, emphasizing intellectual stimulation and inspirational motivation to sustain employee openness to organisational reforms.

- Introduce tech-focused mentoring programs to complement servant leadership's relational strengths, indirectly supporting digital transitions by building employee trust.

- Promote servant leadership practices, such as empathy-driven communication and community-building, to maintain positive work attitudes and reduce resistance during change initiatives.

Contribution to Knowledge

This study provides empirical evidence on the differential effects of transformational and servant leadership on technological and attitudinal changes in the Delta State Civil Service. It highlights transformational leadership's primacy in tech adoption and servant leadership's strength in attitudinal shifts,

offering a nuanced understanding of leadership's role in public sector change management.

Suggestions for Further Studies

Future research could use longitudinal designs to examine change dynamics over time or explore

mediators like organisational culture. Comparative studies across Nigerian states or mixed-methods approaches incorporating qualitative insights from senior officials would further enrich the understanding of leadership's impact on organisational change.

Publication Date: 2025/11/28

Abstract

Leadership significantly influences organizational transformation in Nigeria, as both public and private sectors encounter socio-economic, political, and technological challenges. This research investigates the impact of leadership styles on organizational change at Delta State University (DELSU) and PremiumTrust Bank during the period from 2021 to 2025. Influenced by New Public Management and Contingency Theory, the study employs a qualitative comparative case study framework, examining secondary data from institutional reports, policy documents, peer-reviewed research, and reliable media outlets through thematic content analysis. Results show that DELSU utilizes transformational and participative leadership styles, fostering employee involvement and incremental cultural shifts within bureaucratic limitations. In contrast, PremiumTrust Bank, led by Dr. Emmanuel Efe Emefienim, employs transformational, adaptable, and digitally-focused leadership, facilitating swift technological adoption, structural changes, adherence to regulations, and competitive advancement. The research emphasizes that the effectiveness of leadership relies on its context, affecting how quickly and in what way change occurs. Suggestions involve promoting participatory-transformational leadership in public sectors and adopting adaptable, digitally-focused leadership in private entities to boost innovation and improve operational effectiveness. This study enhances comprehension of how leadership influences organizational change in Nigeria by offering a sector-specific comparative view, stressing the importance of harmony between leadership style, institutional setting, and environmental requirements.

Keywords: Leadership Styles, Organizational Change, Transformational Leadership, Public and Private Sectors, Digital Leadership, Delta State University & PremiumTrust Bank.

Introduction

Leadership serves as a key catalyst for organizational change in Nigeria, where institutions function amid unstable socio-economic environments, political influence, and growing pressures for technological integration. Nigerian research indicates that transformational leadership, especially via personal attention and cognitive encouragement, boosts employee dedication and organizational flexibility (Ohaegbulem et al., 2024; Nwibere, 2023). In manufacturing companies, leadership style influences the effect of digital transformation on worker productivity, highlighting the importance of leaders who merge technological insight with people-oriented strategies (Laoye, 2025). Likewise, research on the reorganization of the Nigerian National Petroleum Corporation (NNPC) into NNPCCL indicates that

democratic and transformational leadership styles are essential for enhancing transparency, accountability, and operational effectiveness amid significant reforms (Igwe, Orovwiro & Okwurume, 2025; Laguo et al., 2021). In the public sector, obstacles like bureaucratic stagnation, insufficient institutional capacity, and inadequate leadership development continue to hinder sustainable change (Abasilim, Durojaiye & Gberville, 2022).

Even with these contributions, there remains a lack of comparative analysis regarding how leadership influences organizational change in Nigeria's public and private sectors. Public organizations frequently encounter limitations due to established bureaucracy and political influence, whereas private companies experience fierce market rivalry and a drive to innovate. Current studies often

analyze each sector separately, resulting in a lack of insight into how leadership practices vary, intersect, or may be applied across different areas. This research tackles that gap by thoroughly analyzing leadership styles—especially transformational and digital leadership—within public and private sectors in Nigeria, emphasizing how contextual factors influence change processes and pinpointing avenues for encouraging lasting organizational transformation.

Research Objectives

The objectives of this study are to:

1. explore how leadership styles shape organizational change processes in Delta State University and PremiumTrust Bank between 2021 and 2025.
2. analyze the similarities and differences in leadership practices influencing employee commitment and institutional transformation across Nigeria's public and private sectors.

Research Questions

1. How do leadership styles shape organizational change in Delta State University and PremiumTrust Bank during 2021–2025?
2. What are the similarities and differences in leadership practices affecting employee commitment and institutional transformation in Nigeria's public and private sectors, and what ways can these be improved?

Scope, Delimitation, and Justification

This research explores leadership and organizational transformation at Delta State University (DELSU) and PremiumTrust Bank from 2021 to 2025. DELSU demonstrates leadership in a bureaucratic, policy-oriented setting, whereas PremiumTrust Bank, a rapidly expanding private organization, exemplifies how transformational leadership fosters digital innovation and expansion. The emphasis is on how leadership approaches—especially transformational, distributed, and digital—impact reforms, technology adoption, employee engagement, and organizational culture. This research is restricted to these two organizations and does not encompass all universities, banks, or national economic strategies. The selection is supported by their differing contexts: DELSU offers perspectives on leadership in public higher education, whereas PremiumTrust Bank emphasizes leadership in a competitive private industry. Combined, they provide a comprehensive perspective on how leaders navigate change in Nigeria's shifting socio-economic and technological environment.

Literature Review

Conceptualizing Leadership and Organizational Change

Leadership and organizational change are intricately connected, with leadership serving as a key factor in influencing organizational direction, employee conduct, and institutional flexibility. Worldwide, leadership is characterized not just by the use of authority but as a relational process that inspires individuals to work towards common objectives in dynamic situations (Bourne, 2017). Nigerian scholarship supports this view, highlighting that leadership is crucial for organizational success, particularly when socio-political factors and institutional shortcomings hinder managerial results (Mukoro, 2021). In this regard, leadership is both situational and fluid, necessitating harmony between approach, context, and organizational requirements.

Organizational change, conversely, is viewed as the intentional alteration of structures, processes, cultures, or technologies within organizations to address internal demands or external disruptions. Researchers like Okereka and Okolie (2022) observe that in Nigeria's public sector, change typically relates to reforms intended to tackle inefficiency, whereas in private companies, it is associated with innovation, competitiveness, and survival in unstable markets. Change can be gradual—small enhancements in processes—or transformational, entailing profound alterations in culture and strategy. In both instances, leadership influences whether change initiatives are accepted or opposed.

Significantly, in Nigeria, the understanding of leadership and change cannot be separated from the country's institutional context. The public sector, characterized by bureaucracy, political influence, and restricted accountability, frequently undergoes gradual change that depends significantly on consensus and authoritative directives (Onyeneké & Abe, 2021). On the other hand, the private sector flourishes through agility, with leaders required to embrace innovative and transformative strategies to maintain growth in the face of intense competition, especially in technology-focused fields such as banking and telecommunications (Okereka & Denedo, 2023). Therefore, leadership and organizational change, although universal concepts, appear distinctly in Nigerian settings, highlighting the necessity of sector-specific evaluation.

Leadership as the Independent Variable

Leadership, as the independent factor, significantly influences the direction and effectiveness of organizational change. Leadership theories emphasize various styles, yet their applicability frequently relies on the context. Transformational leadership, highlighting vision, inspiration, and motivation, has been broadly acknowledged as essential for fostering commitment and innovation throughout change processes (Peng et al., 2020). In

Nigeria, Okereka and Denedo (2023) empirically illustrated this at Delta State University, Abraka, revealing that transformational leadership practices greatly improve employee productivity, organizational commitment, and behavioral alignment—elements that are essential for effective change.

In addition to transformational leadership, participatory and distributed approaches have gained more support within Nigeria's public administration research. Mukoro (2021) posits that collective accountability and collaborative decision-making enhance institutional responsiveness, especially in bureaucratic environments where centralized control frequently hampers innovation. In a similar vein, Okereka and Aliogo (2022) noted that engaging employees in leadership decisions in the Delta State Public Service enhanced organizational productivity and diminished resistance to change efforts. These results correspond with global views, like the distributed leadership model by Jones and Harvey (2017), yet are unique to the Nigerian setting where hierarchical frameworks frequently obstruct widespread involvement.

An additional facet of leadership that is becoming more significant in Nigeria is digital and adaptive leadership. Due to the emergence of fintech, cashless policy changes, and digital transformation post-COVID, leaders in the private sector—especially within banking—must demonstrate agility, digital competence, and ethical awareness in driving change (Quaquebeke & Gerpott, 2023). PremiumTrust Bank, which received its license from the Central Bank of Nigeria in December 2021 and began operations in April 2022, illustrates this reality as a newcomer facing fierce competition and technological changes in the banking sector (Independent, 2022). Its rise demonstrates that leadership must strike a balance between regulatory adherence, swift innovation, and customer-centric strategies to stay competitive. This illustrates Mark and Erude's (2023) contingency assertion that effective leadership in change management relies on matching leadership strategies with situational requirements.

Grasping leadership in Nigeria acts as a driving force for organizational transformation, with research indicating that transformational, participatory, and adaptive approaches improve change results in various sectors. However, difficulties continue when leadership is transactional or authoritarian, frequently leading to pushback, weak commitment, and less than ideal change results. Comprehending leadership as the independent variable necessitates not only acknowledgment of leadership theories but also appreciation of Nigeria's unique institutional characteristics and changing socio-economic environment.

Leadership and Organizational Change in Nigeria

Leadership continues to be crucial in influencing the results of organizational change within Nigeria's public and private sectors. Contingency theorists contend that the effectiveness of leadership hinges on the match between organizational circumstances and management approaches, particularly in environments characterized by uncertainty and intricacy (Mark & Erude, 2023). In Nigerian universities, transformational leadership has been associated with staff dedication and institutional efficiency, emphasizing the significance of visionary leadership in facilitating lasting change (Okereka, 2021). Likewise, Mukoro (2017) highlights that participatory leadership enhances responsiveness and accountability, allowing institutions to adjust to changing governance and management challenges.

In the banking sector, Adeosun (2020) shows that leadership style greatly affects innovation and employee performance, with transformational leadership being especially potent in fostering adaptive capacity. Onyeneke and Abe (2021) additionally demonstrate that leadership focused on change improves employee acceptance of reforms, bolstering organizational preparedness for transformation. In contrast, transactional leadership has faced criticism for securing immediate compliance while failing to promote lasting transformation (Leo & Wickenberg, 2013). The increasing importance of digital leadership demands consideration as well. Eneh (2022) notes that Nigerian banks are progressively depending on leaders who possess technological foresight and the ability to adapt in order to manage digital transformation. This corresponds with international research indicating that artificial intelligence and digital technologies are transforming leader-follower relationships (Quaquebeke & Gerpott, 2023). PremiumTrust Bank, launched in April 2022, has established itself as a tech-focused institution, leveraging innovation and strategic leadership to enhance market entry and expansion (Independent, 2022). These findings strengthen the claim that leadership approaches and tactics directly affect the effectiveness of organizational change, especially in Nigeria's fast-paced banking and higher education sectors.

The Leadership–Change Nexus

Leadership is a critical factor in how organizations manage, execute, and uphold change. In Nigeria, where government bodies frequently face bureaucratic inflexibility and private firms function in intensely competitive settings, leadership approaches greatly affect staff preparedness,

dedication, and the enduring success of change efforts (Mark & Erude, 2023).

Leadership Influence on Organizational Change

Transformational leadership, characterized by an inspiring vision, intellectual stimulation, and individualized consideration, has repeatedly been linked to enhanced employee motivation and successful organizational change (Onyeneke & Abe, 2021). In contrast, transactional and authoritarian approaches, while effective for securing prompt compliance, often impede creativity and the sustainability of change over time (Leo & Wickenberg, 2013). Strategies for distributed and participatory leadership that foster inclusion and shared decision-making reduce resistance and increase ownership of change, particularly in bureaucratic settings (Mukoro, 2017).

Case Study: Delta State University (DELSU) and PremiumTrust Bank

Transformational and participatory leadership approaches at Delta State University (DELSU) have played a crucial role in fostering institutional change in a bureaucratic setting. Okereka (2021) discovered that leaders who effectively communicate visions and engage staff in decision-making boost employees' sense of ownership regarding reforms, diminish resistance, and improve commitment. Participatory frameworks at DELSU have demonstrated enhancements in responsiveness, productivity, and overall institutional efficiency (Okereka & Aliogo, 2021). In the private sector, PremiumTrust Bank demonstrates the influence of leadership in a fast-changing, competitive environment. With Dr. Emmanuel Efe Emefienim at the helm, the bank has reached significant milestones, such as timely adherence to the Central Bank of Nigeria's ₦200 billion minimum capital threshold, swift asset expansion, and noteworthy profit surges (Alagbe, 2025; Premium Times, 2025; BusinessDay, 2025). Dr. Emefienim's leadership merges transformational, adaptive, and digital-focused strategies, prioritizing strategic vision, operational efficiency, innovation, and employee involvement (Eneh, 2022; Quaquebeke & Gerpott, 2023). This demonstrates that leadership needs to be customized to specific industry contexts to successfully facilitate organizational change.

Leadership and Organizational Culture

Both DELSU and PremiumTrust Bank illustrate that the effectiveness of leadership is strongly linked to the culture of the organization. At DELSU, promoting involvement, interaction, and communication within bureaucratic limitations has improved employees' preparedness for both gradual and transformative reforms (Okereka, 2021);

Onyeneke & Abe, 2021). At PremiumTrust Bank, fostering a culture of responsibility, teamwork, and technological flexibility has facilitated swift change and competitive advantage, highlighting the significance of culture-aligned leadership in private entities.

Comprehending the experiences of DELSU and PremiumTrust Bank supports the tenets of contingency theory: the efficacy of leadership relies on the interaction among organizational context, sector demands, and the characteristics of change initiatives (Mark & Erude, 2023). Transformational and participative leadership styles are successful in managing bureaucratic public entities, while transformational, adaptive, and digital-focused strategies—like those demonstrated by Dr. Emefienim—are crucial for attaining swift, sustainable progress in private sector companies. Collectively, these instances highlight the essential importance of leadership in influencing organizational preparedness, dedication, and sustained success amid times of transition.

Theoretical Framework

This study utilizes New Public Management (NPM) and Contingency Theory to analyze leadership and organizational transformation in Nigeria's public and private sectors. NPM, based on reforming public administration, highlights the importance of efficiency, accountability, decentralization, and incorporating private-sector methods within public organizations (Adebayo, 2014; Ezeani, 2015). Its significance is in elucidating current reform initiatives in Nigerian universities like Delta State University, where bureaucratic limitations require more results-driven leadership. Simultaneously, the concepts of NPM align with private entities like PremiumTrust Bank, where competitiveness, customer orientation, and outcome-focused strategies are essential for ongoing success and expansion.

Alongside NPM, Contingency Theory argues that the effectiveness of leadership relies on the alignment between leadership style, organizational culture, and situational requirements (Fiedler, 1967). In Nigeria, Mark and Erude (2023) suggest that contingency theory offers a useful perspective for comprehending how institutional environments influence leadership results, especially in contexts with differing objectives and resources like universities and banks. Through the integration of NPM and Contingency Theory, this research places leadership within the frameworks of reform and efficiency as well as the contextual factors that shape leaders' impact on organizational change. This twofold framework enables an equitable comparative evaluation of DELSU and PremiumTrust Bank from 2021 to 2025.

**Conceptual Framework: Leadership and Organizational Change in Nigeria
(NPM + Contingency Theory)**

Figure 1

Conceptual Framework for Leadership and Organizational Change in Nigeria (NPM & Contingency Theory). *Authors design.*

Gaps in the Literature

Although the current literature offers important perspectives on leadership and organizational change in Nigeria, there are still significant gaps, especially concerning the comparative dynamics of public and private sectors. The majority of Nigerian research emphasizes only public entities, including universities and ministries (e.g., Okereka, 2021; Okereka & Aliogo, 2021), or private sectors, like banks (Eneh, 2022; Quaquebeke & Gerpott, 2023). There is a scarcity of empirical studies that concurrently investigate both sectors to pinpoint similar and different patterns of leadership impact on change results. Limited research has focused on the timeframe of 2021–2025, which holds particular importance because of post-COVID recovery, digital transformation, and regulatory changes. This time has experienced significant changes in organizational frameworks, technology integration, and employee involvement strategies, but the research has not adequately addressed how leadership approaches have evolved in response to these developments. Despite the individual examination of transformational, transactional, distributed, and digital leadership styles (Onyeneke & Abe, 2021; Eneh, 2022; Mukoro, 2017), research connecting particular leadership styles to quantifiable change outcomes in various institutional settings in Nigeria remains limited. The significance of digital leadership in driving swift change in private sector banks such as PremiumTrust Bank is well established, yet equivalent comparative evaluations in public institutions are mostly lacking. Current research frequently focuses on structural or procedural elements of change management, while paying little regard to psychological factors like employee attitudes, readiness, and commitment (Okereka,

2021; Onyeneke & Abe, 2021). These human factors are essential, particularly in bureaucratic public organizations where opposition to change is a frequent issue.

Research Method

This study utilizes a qualitative, comparative case study approach to analyze the impact of leadership on organizational change within Nigerian public and private sector entities, concentrating on Delta State University (DELSU) and PremiumTrust Bank. It depends solely on secondary sources such as organizational reports, policy documents, published research, and trustworthy media reports to investigate leadership practices, institutional culture, and outcomes of change (Yin, 2018; Creswell & Poth, 2018). Data are examined through thematic content analysis, pinpointing essential patterns and themes concerning leadership styles and their influence on organizational change. A comparative perspective emphasizes variations and commonalities across sectors, especially in how transformational, participatory, and digital/adaptive leadership methods either promote or hinder change efforts. The research maintains rigor and reliability by utilizing peer-reviewed sources and official institutional documents to create a cohesive, evidence-driven comprehension of the leadership–change relationship in Nigeria (Braun & Clarke, 2006; Lincoln & Guba, 1985).

Findings and Discussion

The examination of secondary data from Delta State University (DELSU) and PremiumTrust Bank uncovers clear trends in the influence of leadership styles on organizational change in both public and private sectors in Nigeria. Through thematic content analysis, three key themes were identified:

leadership approaches, results of organizational change, and sectoral differences.

Leadership Strategies and Practices

At DELSU, leadership mainly focuses on transformational and participatory approaches, highlighting teamwork, communication, and staff engagement in decision-making activities. Okereka (2021) along with Okereka and Aliogo (2021) suggest that these methods enhance employee dedication, lessen opposition, and facilitate gradual changes within the limits of bureaucratic frameworks. Conversely, PremiumTrust Bank represents a blend of transformational, adaptive, and digitally-focused leadership guided by Dr. Emmanuel Efe Emefienim. Reports suggest that Dr. Emefienim's strategic vision, focus on technology integration, and people-oriented management have propelled swift operational changes, ensured regulatory adherence—including satisfying the CBN ₦200 billion capital requirement—and improved organizational competitiveness (Eneh, 2022; Premium Times, 2025; Alagbe, 2025). This comparison highlights that the effectiveness of leadership depends on the sectoral context, in line with contingency theory (Mark & Erude, 2023).

Organizational Change Outcomes

The results show that the style of leadership directly influences the character and effectiveness of organizational change. At DELSU, participatory and transformational leadership enabled gradual and cultural changes, enhancing staff involvement and responsiveness despite institutional constraints. In contrast, the leadership at PremiumTrust Bank encouraged swift structural and technological transformations, nurturing agility, innovation, and trust among stakeholders. These results demonstrate the relationship between leadership behaviors and organizational culture, emphasizing that successful leadership needs to adjust to institutional limitations and market requirements (Onyeneke & Abe, 2021; Eneh, 2022).

Sectoral Differences and Consequences

The comparison shows distinct differences among sectors. Public sector entities, limited by red tape and political supervision, depend on inclusive, people-focused leadership to implement lasting change. Private sector companies, encountering competitive and regulatory challenges, gain from strong, adaptable, and digitally proficient leadership to facilitate swift transformation. These findings strengthen the idea that leadership cannot

be one-size-fits-all; its effectiveness relies on the context, necessitating harmony with organizational objectives, employee anticipations, and external influences (Mukoro, 2017; Mark & Erude, 2023)

Synthesis and Theoretical Implications

Combining these insights with existing research indicates that leadership style is not only procedural but also strategic and psychological, affecting both structural reforms and employee perceptions of change. Transformational and participatory leadership foster ownership and preparedness in bureaucratic settings, whereas adaptive and digital-focused leadership allows for competitive agility in changing conditions. Collectively, these perspectives foster a detailed comprehension of the leadership-change connection in Nigeria, filling voids in comparative sector research and offering empirical backing for contingency-oriented leadership theory.

Conclusion

Leadership plays a crucial role in driving organizational change within Nigerian institutions. Transformational and participatory leadership at DELSU improved employee involvement and supported gradual reforms, whereas transformational, adaptive, and digitally-focused leadership at PremiumTrust Bank allowed for swift, technology-led changes and adherence to regulations. These results emphasize that the effectiveness of leadership relies on the context (Mark & Erude, 2023; Onyeneke & Abe, 2021).

Recommendations

The following are policy recommendations for the study:

1. Public Sector: Cultivate leaders possessing transformational and participatory abilities to enhance employee involvement and decrease bureaucratic opposition.
2. Private Sector: Embrace flexible and digital-driven leadership to foster innovation, responsiveness, and adherence in competitive landscapes.

Contribution to Knowledge

This study offers comparative perspectives on leadership and organizational transformation in Nigeria, illustrating how leadership styles specific to sectors influence the effectiveness of change efforts and highlighting the necessity of aligning leadership approaches with organizational context.

Abstract

Local government autonomy in a federal structure means local government, the third layer of a federal government enjoys a distinct separate existence and independence from the control of the state and federal governments: it is not an extension of the state but an independent formation which discharges its responsibilities as provided by the constitution. It is somewhat worrisome that local government councils in Nigeria have no political, financial and bureaucratic autonomy. Various related literature reveal that Governors in Nigeria sack democratically elected local government councils immediately after their swearing-in as elected State Governors and constitute caretaker committees; Governors are in charge of Local Government Councils' Purse through the State and Local Government Joint Account; and Local Government Councils lack full blast financial autonomy. The major objective of this paper is to examine the effects of fiscal decentralization on Local Government Autonomy in Nigeria, using a qualitative research method which focused on secondary method of eliciting data from existing sources. The theoretical framework applied for this paper is federalism, whose leading proponents are K.C Wheare, William Riker and Dyke et al. This paper also peruses at different formulae adopted by Nigeria to allocate revenue (1946 – 2004) and the Supreme Court of Nigeria judgment in the case of Attorney – General Federation vs. Attorney-General, Abia State and 35 others. The study finds that the state and local government Joint Account worked hardship on local government councils in Nigeria among others. The paper finally made some recommendations that would help improve service delivery in local government councils in Nigeria among others.

Keywords: Local Government Council, State Government, Federal Government. Autonomy, Fiscal, Decentralization,

Introduction

Local Government Autonomy in a federal's design means local government, the third layer of a federal government enjoys a distinct separate existence and independence from the control of the state and federal governments. It is not an extension of the state but an independent formation which discharges its responsibilities as provided by the constitution. It is somewhat worrisome that local government councils in Nigeria have no political, financial and bureaucratic autonomy. Various related literature reveal that Governors in Nigeria dissolve local government councils immediately after their swearing-in as democratically elected State-Governors and constitute caretaker committees with a view to using them as conduit pipes to drain the local Government Councils weak purse among other reasons.

In addition, in Nigeria, Governors are in control of Local Government Councils purse through the State and Local Government Joint Account which makes it cumbersome for the realization of complete fiscal autonomy of the local government councils in Nigeria, thereby making development, goods and services delivery at the grassroot not achieved. The local government councils lack full blast bureaucratic autonomy of hiring, firing, managing and servicing their human resources without the interferences of the state governments in Nigeria. It is pertinent to deduce that in Nigeria, local government councils are adjuncts of the state government and against this backdrop, local government councils in Nigeria function as mere extension of State Ministry of Local Government and Chieftaincy Affairs.

State Governors and the Administration of Local Governments in Nigeria”. implications for “Good Governance”, contended that autonomy of the local government envisages the political, fiscal and administrative aspects of its existence. Fiscal Decentralization means interrelationships at the Federal, State and Local Government levels in a state that operates federalism, these levels of government have their constitutionally responsibilities and therefore need a stable, strong and reliable sources of revenue with which they can discharge their constitutional responsibilities to the citizenry and involve in the act of governance and this demands allocation of resources and or value. This is the rationale for revenue allocation. Revenue Allocation is the sharing of country’s financial resources among the layers of governments in the federation. This enhances economic growth and development across board and also reduces intergovernmental tensions and promotes national unity. Drawing from Mukoro, (2019), he contended that the essence of fiscal federalism cannot be over emphasized. He further averred that it allows for governance to get very near to the grassroot; makes effective decisions making in the levels of government and exposes incompetent and fraudulent government officials at all levels of government. He went on to opine that without effective and efficient fiscal decentralization, local government will lack autonomy and capacity to deliver goods and services to the grassroot. It is very unfortunate that local governments in Nigeria do not have autonomy. This is the nub of the matter that has flared up this paper.

Research Questions.

The following research questions are designed to guide the study

- i. To what extent has the introduction of caretaker committees to local government administration by State Governors affected grassroots’ participation in local politics in Nigeria.
- ii. Has the State and Local Government Joint Account worked hardship on Local Government Councils in Nigeria.
- iii. Are State Governments through their local government service commission affirm monopoly of personnel matters in local government administration in Nigeria.
- iv. Is the judgment delivered by the Supreme Court of Nigeria on the 11th day of July, 2024 in the case of Attorney – General of the Federation Vs Attorney – General of Abia State and 35 others, wherein the Supreme Court of Nigeria granted financial autonomy to democratically elected local government councils in Nigeria constitutional.

Objectives of the Study

The major objective of the study is to examine the effects of fiscal decentralization on local government autonomy in Nigeria. The specific objectives are examined hereunder:

- to ascertain the impact of caretaker committees on the grassroots’ participation in local politics in Nigeria.
- to explain the hardships the State and Local Government Joint Account has worked on local government councils in Nigeria.
- i. to evaluate the monopoly of personnel matters in local government administration through local government service commission in Nigeria.
- ii. to look into the judgement delivered by the Supreme Court of Nigeria on the 11th day of July, 2024 in the case of Attorney-General of the Federation Vs. Attorney-General of Abia State and 35 others, wherein the Supreme Court of Nigeria granted financial autonomy to democratically elected local government in Nigeria.

Literature Review

Several scholars have carried out numerous studies on Local Government Autonomy and Fiscal Decentralization in Nigeria. For instance, in a paper presented by Omoniyi (2013) titled “Local Government autonomy: Will Governors Succumb? He advanced that since the introduction of caretaker committees regime into local government councils in Nigeria, there had been cases of illegal diversion of funds belonging to local government councils by the State Governors. The extant constitution of the Federal Republic of Nigeria provides in Section 7 (1) for a sustainable democratically elected local government councils in Nigeria.

The introduction of caretaker committees in local government councils in Nigeria is an aberration of the extant constitution. It is a conduit pipe for the State Governors to drain the weak purse of the local government councils and it was done with the intention of the State Governors to dismantle the autonomy of local government councils in Nigeria. The local government funds have been crippled and bastardized through the establishment of the Joint Account and Allocation Committee (JAAC) chaired by the State Government Representatives. The Joint Account and Allocation Committee (JAAC) is detrimental to local government councils because it stops the local government councils from managing and controlling their monies. It has to be pointed out that local government through the power and authority of Joint Account and Allocation Committee, Local Government Councils are deprived of their funds to discharge their democratic obligations. To this extent, local government councils are subservient to state

governments' controls and this has effects on local government councils' obligations to the grassroots. Besides, Adeyemo (2005) averred that the fight for local government autonomy in Nigeria has been a sustainable fight. He also posited that the hijack of local government functions and revenue base by the state governments is another fundamental area of dismantling the autonomy of the Local Government Councils in Nigeria. The conflictual revenue boards by the state governments stop and disturb the revenue base of the local government councils. Parallel boards set-up by the state government are markets, motor parks, building plans approval and forest royalty collection fund etc. Against all these backdrops, the problem of local government autonomy are so cumbersome to resolve. Local Government Autonomy seems weakest in the country in the sphere of personnel administration and it is one area which is not given consideration in terms of coverage constitutionally, but rather administrative provision. This may be the reason why the state governments through their local government service commission in Nigeria affirms monopoly of personnel matters in local government administration. The 1976 local government reforms had only asserted weakly that local government shall have fundamental control over local and staff affairs. What happens in one state is also applicable in all other states with respect to local government personnel especially by virtue of the meeting of Local Government Service Commission all over the country.

The Local Government Service Commissions exchange their annual reports to make them have an idea of what others are doing. The conspiracy between the local government service commission and state governments has put personnel administration full under their control. Despite the advantages of this option, encompassing uniformity and reduced politicization in personnel administration, Local government Autonomy in the matter is limited and can distribute their development in rural area in Nigeria. Quadri (2013) submitted that powers should be given to the local government councils to have substantial control over local affairs as well as the staff institutional and financial powers to initiate, direct provision of services, determine and implement projects so as to compliment the activities of the state and federal governments in the areas, and to ensure through devolution of functions of these councils through the active participation of the people and their traditional institutions that local initiatives and responses to local needs and conditions are maximized.

Imhanlahimi (2019) adumbrated that fiscal autonomy in local government is generally believed to be the best tool for effective and efficient service delivery in rural areas. Okorie, Obasi, Nwosu, Chukwu, Akanu and Nwuta (2023) deduced that there is no doubt that the

extant constitution erroneously empowers the Governors of control over local government councils through State and Local Government Joint Account which makes it impossible for the realization of full fiscal autonomy of the local government, thereby making development, goods and service delivery at the local level unreliable. They went further to state that fund allocated to local government through revenue sharing have consistently been hijacked by the various state governments through the idea of State Local Government Joint Account (SLGJA).

Osakwe (1999), in his book "Fiscal Relations among three tiers of Government in Nigeria". He contended that in fiscal federalism and Economic Development, local government fiscal autonomy is derived from the fiscal federalism as it is operated in the Nigerian Federalism. He further posited that fiscal federalism is the transfer of functions, resources and authority to peripheral levels of government. He also relates the disposition of tax powers retention of revenue and methods adopted in sharing centrally collected revenue in accordance with the extant constitutional responsibilities of all levels of governments. Olabisi (2019) advanced that the need for local government autonomy is to allow the local government specific powers to performance series of functions, plans, formulate and execute its own policies, programmes and projects and its own rules and regulations as expected for its local needs.

Adeyemo (Supra) noted that financial autonomy under a federal system of government is that each government enjoys or separate existence and financial independence from the control of the other government. He further noted that it is an autonomy which requires not just the legal and physical existence of an apparatus of government such as financial autonomy enjoyed by Legislative Assembly and Governors. Local government should be autonomous having freedom to hire and manage its own staff, raise and manage its own finance, make policies, laws and provide services within the limits of its resources and function without interferences.

Vincent (2001), averred that matured democratic societies practicing federalism have somehow managed to evolve a satisfactory balance among the federal, state and local government tiers of government and sharing of the available resources among the layers of government to fulfill the respective functions designed for each level of government in their country's constitution. The exercise operates in the spirit of equity, justice and fairness in a polity that aspires for progress, stability, peace and egalitarianism within its human community.

Awa (1976) averred that a general problem among the federating units in a country is "how to allocate revenue among levels of government and among the

units so that each government may have the power to perform the functions assigned to them. The government uses her instrument of fiscal policy to alter the shape of Revenue Allocation to promote growth, equity in the redistribution of resources and stability within the polity. Bello Imam (1992) adumerated that the federal government has exclusive legislative list which only the federal government can legislate on, as the state government has power to legislate on concurrent legislative list and the fourth schedule of the extant constitution provides for the duties of local government.

Ordinarily, fiscal policy is to achieve the desired objective of allocation, redistribution, stabilization and economic growth. Komolafe (1999) posted that policy is a fundamental tool used in the pursuit of social and political objective, especially those which aim to reduce inequalities of wealth and opportunity. The inchoate state of democratic government in Nigeria makes the operation of fiscal federalism to be fraught with a lot of problems. Orubu, (1999) contended that fiscal system will be said to be relatively decentralized if lower tiers of government exercise a relatively high degree of freedom in raising taxes or revenue needed to carry out their expenditure, responsibilities, since such responsibilities expand overtime.

Anyawu (1997) advanced that a decentralized system of Revenue sharing means that the other tiers of government becomes empowered and responsible for the management of huge financial resources that would have gone to the centre under a regime of faulted practice as it obtained in Nigeria. The revenue or resource concerned belong to the community and the taxing and collecting agency is acting on behalf of the community. Amah (2018) in his study "Devolution of Power to Local Government: Appraising local government Autonomy under Nigerian federation; examined the issue of local government autonomy under a federal government and recommends devolution of full political autonomy to local governments.

Asiegbu (2025) contended that the 1976 local government reforms sought to decentralize governance and enhance grassroot development. He further averred that for local government councils to sustain their operations, they have been collecting statutory allocation from the federation account. That between 1999 and 2002, local government councils received their allocation directly from the Joint Federation Allocation Committee (JFAC) of the Central Bank of Nigeria. Later, the Joint Allocation Account Committee (JAAC) was established to manage projects that State and Local Government Councils could jointly finance. It was at this point Direct Allocation to Local Government Councils was stopped with Governors

having unrestricted access to Local Government Councils' funds.

Theoretical Framework

The theoretical framework adopted for this study is federalism. The leading proponent of the theory is K.C Wheare. In his study titled "Federal Government" he submitted that federation is a method of dividing powes so that general and regional government are each other within a sphere, co-ordinate and independent. (Wheare, 1964). Other scholars are William Riker, who adumbrated that federalism is a system of government consisting of autonomous units that tied together within one country. Steiner and Dyke (1995) deduced that it is a division of power between central and regional governments. Such that neither is subordinate to other. Satisfying the expectations and demands of the citizenry boosts interaction among all the layers of government where the ability and capability to meet the responsibilities are looked at as well as contradictions and challenges that follows.

Federalism as a concept of governance is a political and administrative framework in which power is shared by different constituent units of a federating union which are supposedly or relatively autonomous. So, when demand on government and the need to meet them adequately and promptly arise, a proper division of functions according to the corresponding financial powers between the different levels of government becomes imperative. Ihediora averred that the concept of fiscal federalism in Nigeria sees it as the division of powers, functions, duties and financial resources among different levels of government such as federal, state and local governments in a federation.

It is the application of the federal principle in resource mobilization and allocation within and among the constituent units in the federation in an arrangement that involves intergovernmental fiscal relations. Resource control is premised on Revenue Allocation.

Local Government Autonomy

Autonomy under the federal system as each tier of government enjoying a separate existence and independences from the cntrol of the other government. Autonomy requires not just the legal and physical existence of an apparatus of government as the legislative assembly, government court etc, but that each government must exist not as an adjunct of another government but as autonomous entity in the sense of being able to exercise its own will in the conduct of its affairs free from direction of another government.

Anayochukwu and Ani (2021) in their study on local government autonomy in Nigeria: Its problems and prospects. Their study adopted a quantitative research approach to discover and explain the existence of

constitutional ambiguities or inconsistencies that tend to provide the drive from unethical state officials to nurse the inordinate desire for hedging in the local government left, right and centre. Their finding revealed that there is jurisdiction rivalry between the state and local governments like rates collected, distribution of fertilizers, and other farm materials like pesticides. Their study concluded that legal and constitutional requirement, no matter how full proof they may be, cannot guarantee true autonomy for the local government as a tier, unless the political will exists on the part of a statesman to streamline and stabilize this very critical level of government. The study recommended that local government autonomy is fastened on an improved revenue base, adherence to constitutional provisions, political stability, accountability and transparency in governance.

To enhance the efficiency and effectiveness of the local government system, there is an urgent need to amend the constitution and delimit areas of inter-government functions especially in electoral matters, creation of local government, tenure of councils, and finance. The council elections should be conducted as at when due, to avoid a democratic vacuum. This is dangerous to the government. Again, Felix and Okonette (2018), on their parts carried out a study on politics of local government autonomy in Nigeria. Their study also adopted a quantitative research approach and thematic analysis to discover and explain that in Nigeria, the federal and state governments mostly transfer the kind of autonomy shaped by ethnic consideration to the local government. Also, that the blockage of local government autonomy is further evident at the fiscal and management employment stages than in any other areas of inter-governmental dealings. The study concluded that local government is a distinctive political arrangement and the degree of autonomy it enjoys from federal or regional or state government corresponds with the politics of the state.

In addition, Samson and Stanley (2015), in their study "State Governors as albaross to democracy and local self-government in Nigeria. The study adopted historical and content analysis method to discover that since the year 1999 and emergence of the fourth Republic, not less than seven State Governors have dismissed or dissolved local government councils in the country. The study further revealed that despite dismissal of elected local government officials, State Governors deny local governments access to statutory allocation or deny them of their full responsibilities. The study recommends a full autonomy for local governments disregarding the meddling of State Governors and that the people at the grassroots should be empowered to sack their representatives either through recall or by denying them the opportunity for another term of office through the ballot.

There are three types of autonomy. Fiscal autonomy means local government managing their own finances and collecting revenue without molestation from the state government.

Bureaucratic and Administrative autonomy means local government hiring and firing their own staff from junior cadre to senior staff. Political autonomy means that state government do not have the capacity to dissolve local government councils and put in place of caretaker committees and or interim governments.

Importance of Local Government Autonomy

The importance of autonomy in local government councils cannot be over emphasized. Autonomy increases accountability of local government council to the grassroots. This leads to better life for the periphery. Besides, Autonomy leads to local government area development and it makes local government councils to function without approval from the state government. Local government councils have so much to do hence autonomy. Financial autonomy is the independent management of local government own funds and it makes local government councils to take decision without consulting with the state government. Local government autonomy would make local government councils to tackle their security challenges in their areas.

Again, local government autonomy would improve on delivery essential services like healthcare, education, sanitation and infrastructural development to the grassroots without interference from the state government.

Local Government Autonomy and Corruption

Regardless of the advantages of local government autonomy in Nigeria, it will not expel corruption in local government councils. Officials of local government councils in the past corruptly enriched themselves with local government resources. During the regime of Chief Olusegun Obasanjo, as the President of the Federal Republic of Nigeria, local government councils were receiving allocations directly from the federation account and local government Chief Executive were enriching themselves with the allocations they received from the federation account. The local government legislative arm which is charged with the responsibility of checking the excesses of the Chief Executive failed in their responsibility because they compromised with the Chief Executive of the Local Government Councils.

Fiscal Decentralization in Nigeria

The Nigerian State operates federalism with a federal government, 36 states and 774 local government areas. In federalism, fiscal responsibilities are vested on all the layers of government, federal, state and local

governments. Mukoro, (Supra) averred that federalism means a series of legal and administrative relationships established among units of government possessing varying degrees of real authority and jurisdiction autonomy.

He further submitted that this is the co-existence of both national and sub-national governments which performs the economic functions required by the people of a society or country. In this co-existence, each layer of government has its own expenditure responsibilities and taxing powers. It is the division of fiscal powers among sovereign levels of government in a federation.

Again, decentralization is an inevitable ingredient of governance in Nigerian federation. He further explained that decentralization ascertains the extent to which power sharing among the three levels of government determines the adequacy (public good) or otherwise (public bad) of resources allocated and whether such funds are judiciously allocated or whether they match the state and local government responsiveness to participation in the process of governance. That it means whether local governments, state or communities for that matter are getting enough fund from the system as per their overall contribution to the revenue. Decentralization is an effective tool for increasing the efficiency of public expenditure. Also, it boosts accountability and transparency in the provision of public goods for the well-being of the society. Besides, decentralization means dividing financial and expenditure functions between federal, state and local governments.

The Rationale for fiscal federalism

The rationale for fiscal federalism cannot be over emphasized. Firstly, it allows for government to get very near to the grassroots. Secondly, it makes effective decision making the levels of government and exposes incompetent and fraudulent government officials at the levels of government. Thirdly, it makes the citizens to choose where they want to stay and work because of the benefits accruing from the relationship because there are variations between the states and local government councils in terms of tax structure, security and infrastructure etc. Fourthly, Different layers of government try different approaches to find solutions to issues. Fifthly, weaker states and local government councils rely on allocation from the federation account to discharge their constitutional responsibilities. Sixthly, with the existence of fiscal federalism in a country, there is tendency of people migrating from area where they would not be employed to areas where they will enjoy more comparative advantage especially in terms of services and infrastructure.

Local governments find it very cumbersome to collect taxes unlike the federal government. The federal government has more power to tax evaders than state and local governments.

Also, basic infrastructure like roads, hospital/clinics, schools are provided by the federal and state governments. Again, in a federation, such level of government is a infra sovereign state that should remain co-ordinate and interdependent with one another within the national scheme of things or nation. Moreover, fiscal decentralization has a long history in Nigeria. Before independence in Nigeria, it was used to manage Nigeria's cultural diversity.

Effects of Fiscal Policies in Nigeria

Fiscal policies in Nigeria have been used indiscriminately to alter the allocation of resources which has caused inequality of wealth, opportunities, injustice and lack of fairness amongst the federating units. Mukoro (supra) conceived that a particular revenue sharing formulae adopted at any particular time may appear antithetic to the desire of a particular group of people. For instance, the clamour for resource control by south-south Governors of Nigeria – Those in oil bearing states are laying claim to oil resources located off shore which the sharing formulae allocated to the federal government and as provided in the extant constitution. Furthermore, decentralization has resulted inefficient resource use and has increased cost of governance rather than cost effectiveness. Again, despite the increased funding to sub-national governments, health and education have not improved.

Different Formulae Adopted by Nigeria to Allocate Revenue among the Federating Unit (1946 - 2004).

In adopting a revenue allocation formulae in Nigeria, the following formulae were used.

Derivation & Need Principle, these brought equity to all parts of Nigeria. As a result of sustainable protests, there has been regular review of the revenue allocation formulae between 1946 and 2004. Many commissions and committees were set up on Revenue Allocation. The followings were the commissions set-up.

Commissions and Committee to Review Revenue Allocation between 1946 and 2004

a Sir Sydney Phillipson Commission (1946):

This commission introduced three principles, namely: derivation, development process and population. Criticisms that followed this provisions led to another commission in 1951 chaired by both Sir Sydney Phillipson and Prof. J.K. Hicks to come up with more accepted Revenue Allocation Formulae.

c. **Sir Sydney Phillipson and Prof. J.K. Hicks Commission (1951).**

This commission recommended four general principles which are independent revenue, deprivation, need to national interest as the criteria for revenue sharing. It was also criticized over the control of government collection of duties and tax on premium motor spint.

d. **Sir Louis Chicks Commission (1953)**

This commission was to adjust the previous recommendations and thus came with a main principle and it expatiated derivation.

e. **Sir Jeremy Raisman Tress (1957/58)**

This commission was set up as a result dissatisfaction with the derivation principle and subsequently led to the setting up of distributive pool account and complete regional jurisdiction over personal income tax. It further recommended need balanced development and minimum responsibility with a percentage division of 40% to the North, 31% to the East, 24% to the West and 5% to the Southern Cameroon.

f. **K.J. Binns Commission (1964)**

This commission rejected the principle of Need and Derivation. It increased the percentage of general import revenue, mining rent and royalties payable to the derivation pool account from 30% to 35% and also recommended percentage division of 42% to the North, 30% to the East, 20% to the West and 8% to the Mid-West.

g. **Dina Commission (1968)**

This commission was to look into the distribution of revenue following the splitting of the nation into twelve states. It renamed distribution pool account to state joint account and again created special grant account and advocated for a permanent planning and fiscal commission. In addition, it recommended national minimum standard, balanced development, basic need and national interest in the distribution of revenue.

h. **Aboyade Technical Committee (1977)**

This commission supported the national minimum standard for national integration. It recommended for all the federally collected revenues to be pooled into the federation account and be allocated there from among the federal, state and local governments. It is interesting to note that the local government started receiving their revenue directly from the federation account, as the third tier of government after the Aboyade's Committee Submission of its requirements for the share proportion of 57%, 30% and 10% for federal, state and local government respectively with the remaining 3% for special grant.

i. **Pius Okigbo Commission (1980)**

This commission is charged with the responsibility of looking into the derivation, even development,

equitable distribution and national interest as well as make recommendations on revenue sharing formulae among the layers of government. It recommended percentage on principle of population, social development and internal revenue efforts. It also recommended revenue allocation sharing formula to be 53%, 30% and 10% for federal, state and local government respectively and further recommended 7% as special fund which should be distributed among Federal Capital Territory (FCT), mineral producing areas, derivation, ecological problems, and revenue equalization fund (Okigba, 1980). On its acceptance, the federal government effected some changes as 53%, 35% and 10% for federal, state and local government respectively and also recommended 7% as special fund which should be distributed among Federal Capital Territory (FCT), mineral producing areas, deprivation, ecological problems and revenue equalization fund.

On its acceptance, the federal government effected some changes as 53%, 35% and 10% for federal, state and local government respectively. The government directed that the state revenue allocation of 35% should be applied as follows: equality of states 30.5%, ecological problems 1.0% and derivation principle 3.5% (Ugwu, 2012). Despite all these beautiful recommendations, the commission also received criticisms but the federal military government via their decree only effected changes regarding derivations. Derivation of 2% was to be drawn from revenue relating directly to the state in which minerals were extracted while 1.5% went into fund for the development of mineral producing areas of the country.

Revenue Mobilization Allocation and Fiscal Commission 1988

This commission introduced the principles of equality of states, population, social development factor, landmass and terrain, internal revenue efforts and special fund. It recommended federal government get 50%, state 30%, local government 15% and special fund 5%. Section 153 of the extant constitution provides for the establishment of central federal executive bodies, sub-section (1n), provides for revenue mobilization allocation and fiscal commission with functions, composition and powers as provided in the third schedule of part 1.

As stated in Section 32 of the schedule among others states; review from time to time the revenue allocation to ensure conformity with changing realities. After a Court suit decided by the Supreme Court of Nigeria that nullified the allocation of 7% of the federal allocation to special fund, Former President of the Federal Republic of Nigeria, Chief Olusegun Obasanjo on the 8th day of May, 2002 by an order: Allocation of Revenue (Federation Account etc) changed the existing formulae to federal government 50%, state 24%, local

government 20%, general ecological problems 2%, Federal Capital Territory 1.5% and development of natural resources 3%.

By the month of July, 2002, there was another order that modified the previous order that shared the revenue as: Federal government 54.68%, state government 27.72% and local government 20.6%. Again by March 2004, the Revenue Allocation formulae was modified, federal government 52.68%, state government 24.72% and local government 20.6% which is still in force. Fiscal decentralization which mirrors the amount of fiscal autonomy and responsibility accorded to sub-national government, has been equation of many developing transition and developed countries.

The Review of the Supreme Court of Nigeria Judgment delivered on the 11th day of July, 2024 in the case of Attorney – General Federation vs. Attorney-General of Abia State and 35 others

The Supreme Court of Nigeria, on the 11th day of July, 2024 granted financial autonomy to democratically elected local government councils in Nigeria. The judgment stated that State Governors in Nigeria lack power, authority and locus standi to dissolve local government councils and create caretaker committees and or interim councils. Section 165 of the extant constitution and the Allocation of Revenue ACT of 1982 provides that federally collected revenue be credited to the federation account and distributed monthly among the three levels of government.

Immediately after the judgment was delivered, 10-man inter-ministerial committee was inaugurated, charged with the responsibility of enforcing the judgment. The judgment gave state governments a 3-months deadline to organize elections or risk losing federal statutory allocation for the local government councils. This instruction made many states to organize local government elections. The Supreme Court of Nigeria, having delivered the judgment, some state Governors continued to design strategies to frustrate the judgment. To this extent, some state Governors fraudulently introduced a state legislative bill forcing Local Government Council chairmen to revert back the Allocation collected to the state government.

For instance, a clause of the Anambra State Local Government Law, 2024 requires the federal government allocations to Local Government Councils be placed first in the State Joint Local Government Account. This was repugnant to the supreme court of Nigeria Judgment delivered on the 11th day of July, 2024 granting financial autonomy to democratically elected local government councils in Nigeria. The commencement date for the direct disbursement of local government councils. Federal allocation was initially set for October, 2024 but was altered to

January, 2025 because of the agreement with the State Governors to organize elections for their local government councils with immediate effect.

On January, 2025, the Central Bank of Nigeria refused and failed to pay Local Government Councils account directly instead, the Central Bank of Nigeria diverted the Local Government Council monies totalling N361.754 billion from the total of N1.424 Trillion distributable revenue through state governments.

Matawalle (2024) posited that it was the President who provided the enabling environment for the judgment of the Supreme Court and that the Presidency abandoned the judgment of the Supreme Court of Nigeria and sought political solution. It is pertinent to observe that the Supreme Court of Nigeria judgment delivered on the 11th day of July, 2024 in the case of Attorney-General, Federation vs Attorney-General of Abia State and 35 others is at variance with the provision of the constitution of the Federal Republic of Nigeria, 1999, as Amended. In a nutshell, the judgment is unconstitutional, it does not provide for local government councils' autonomy. It provides for the oversight function by the State Governors. The judgment is expected to boost Local Government autonomy but constitutional provision is more concrete than Court Judgment.

Umoh, Akewu-Shola, and Essien (2024) explained that section 7 of the extant constitution recognises local government and provides for its structure, composition, finance and positions. But tied them to be supervised by the state government. The extant constitution does not recognise financial autonomy of the Local Government Councils in Nigeria. However, the functions of Local Government Council are provided for the extant constitution in the 4th schedule of the extant constitution. The extant constitution also provides that local government councils could make consideration and recommendations to the state commission on economic planning and or similar body. Paragraph 1(a) of the 4th Schedule, of the extant constitution provides for the functions of local government councils in contributing to economic development in their areas.

Summary

This study used the qualitative research method. Secondary data obtained from text books, academic journals, newspapers and internet services.

The questions raised for this study were discussed and the findings are as follows:

The introduction of caretaker committee to local government administration by the state governments affected grassroots' participation in local politics in Nigeria.

- ii. The State and Local Government Joint Account (SLGJA) worked hardship on local government councils in Nigeria.
- iii. State governments through their local government service commission affirm monopoly of personnel matters in local government administration in Nigeria.
- iv. The judgment delivered by the Supreme Court of Nigeria on the 11th day of July, 2024 in the case of Attorney-General of the federation vs. Attorney-General, Abia State and 35 others wherein the Supreme Court of Nigeria granted Financial Autonomy to democratically elected Local Government Councils in Nigeria is unconstitutional. In the hierarchy of laws in Nigeria, the constitution of the Federal Republic of Nigeria, 1999, as amended ranks number one. Therefore, all laws must be in conformity with the extant constitution. The extant constitution does not provide for local government autonomy.

Conclusion

This study was flared up by the desire of the researcher to examine the effects of fiscal decentralization on local government autonomy in Nigeria. The findings of the study shared that the introduction of caretaker committee to local government administration by the state governments affected grassroots' participation in local politics in Nigeria.

Also, the State and Local Government Joint Account affected local government service delivery. Besides, Local Government Service Commission hijacked personnel matters of the local government. Again, the Supreme Judgment delivered on the 11/2/24 is unconstitutional.

Recommendations

The researcher haven carried out a careful exhaustive study on Local Government Autonomy and fiscal decentralization in Nigeria, put forward the following recommendation which I believe will go a long way in solving the issues that characterized Local Government Autonomy and Fiscal Decentralization in Nigeria.

- i. The political space should be opened for the grassroots with a view to participating in their own local government council elections in Nigeria.
- ii. Section 162(6) of the Constitution of the Federal Republic of Nigeria, 1999 as Amended which provides for the establishment of the State Joint Local Government Account (SJLGA) should be expunged from the constitution.
- iii. Local Government Service Commission created to sustain monopoly of personnel matters in local government administration in Nigeria should be scrapped.
- iv. The judgment delivered by the Supreme Court of Nigeria on the 11th day of July, 2024 in the case of Attorney-General, Federation vs. Attorney-General,

Abia State and 35 others wherein the Supreme Court of Nigeria granted Financial Autonomy to democratically elected Local Government Councils in Nigeria should not be used as a judicial precedent and it is unconstitutional.

Publication Date: 2025/11/28

Abstract

This study investigates the relationship between management capability and business performance in Nigerian private firms, focusing on strategic management, leadership and decision-making, and operational and human resource management competencies. Using a quantitative cross-sectional survey, data were collected from 317 respondents across Lagos, Ogun, and Rivers States, with 300 valid questionnaires analyzed. Descriptive statistics, correlation analysis, and multiple regression were employed to assess the influence of management capability on firm performance, measured through profitability, productivity, market share, and operational efficiency. Findings reveal that all three dimensions of management capability significantly and positively impact business performance, with leadership and HR management capability exerting the strongest effect. The study underscores the critical role of strategic foresight, effective leadership, and operational adaptability in enhancing organizational outcomes in competitive and dynamic markets. Based on the findings, the study recommends strengthening strategic planning, leadership development, and operational excellence to optimize firm performance. The study contributes to the literature by providing empirical evidence on how managerial competencies shape business success in emerging economies, highlighting avenues for future research on organizational culture, innovation capability, and technology adoption.

Keywords: Management Capability, Business Performance, Strategic Management, Leadership, Human Resource Management, Nigeria

Introduction

Management capability is widely recognized as a key determinant of business performance, particularly in competitive and dynamic markets. In Nigeria, private firms face an array of challenges that test the effectiveness of their managerial structures, including economic volatility, regulatory uncertainties, intense competition, and technological disruption. The capacity of management to plan strategically, coordinate resources, make timely decisions, and respond to emerging business trends often determines the success or failure of these organizations. Business performance, which encompasses profitability, market share, productivity, and sustainability, is heavily influenced by managerial competence. Studies have shown that firms with strong management practices are better positioned to leverage resources efficiently, innovate, and achieve organizational objectives (Obaji & Ogbari, 2018). Conversely, inadequate management skills, poor leadership, and lack of strategic foresight often result in operational inefficiencies, reduced competitiveness, and financial underperformance.

In the Nigerian context, private firms operate in a highly heterogeneous environment where managerial capability is not only about technical expertise but also includes leadership acumen, decision-making effectiveness, human resource management, and adaptability to socio-economic changes. Despite the recognized importance of management competence, there is evidence that many firms struggle with managerial inefficiencies, leading to suboptimal business outcomes (Adewale & Ojo, 2020). These inefficiencies can manifest in poor financial results, employee disengagement, low productivity, and weak market positioning, which collectively undermine the overall performance of private firms. Moreover, the complex interplay between management capability and business performance in Nigeria has drawn scholarly attention due to the recurring cases of business failures, even among well-established firms. Understanding how management practices influence performance outcomes is therefore crucial for developing strategies that enhance organizational effectiveness and sustainability. This study seeks to investigate the relationship between management capability and business performance in

Nigerian private firms, identifying the areas where managerial strengths and weaknesses directly impact organizational success.

Problem Statement

Management capability is widely recognized as a critical determinant of business performance, encompassing strategic planning, leadership, decision-making, and operational efficiency. In Nigeria, private firms operate in a highly volatile and competitive environment characterized by economic fluctuations, regulatory uncertainties, technological disruptions, and increasing market competition. Despite these challenges, many organizations continue to underperform, with recurring reports of financial losses, low productivity, poor employee engagement, and weak market positioning. Evidence suggests that these suboptimal outcomes may be linked to inadequacies in management capability. Managers in some Nigerian private firms often struggle with strategic foresight, effective decision-making, employee motivation, and operational adaptability. Such gaps in managerial competence can lead to inefficient resource utilization, reduced innovation, and ultimately, poor organizational performance. While prior studies have highlighted the importance of management competence in driving business success globally, there is limited empirical research examining how management capability specifically influences the performance of private firms in Nigeria. This study seeks to address this gap by investigating the relationship between management capability and business performance in Nigerian private firms, with the goal of identifying the managerial strengths and weaknesses that have the most significant impact on organizational outcomes. The findings are expected to provide actionable insights for improving management practices and enhancing the overall performance and sustainability of private firms in the Nigerian context.

Objectives

The general objective of the study is to examine the relationship between management capability and business performance in Nigerian private firms. The specific objectives are:

- i. to assess the influence of strategic management capability on the business performance of Nigerian private manufacturing firms.
- ii. to evaluate the impact of leadership and decision-making capability on organizational productivity and profitability.
- iii. to investigate the role of operational and human resource management capability in enhancing overall business performance.

Research Questions

- How does strategic management capability influence the business performance of Nigerian private manufacturing firms?
- What is the impact of leadership and decision-making capability on organizational productivity and profitability?
- i. How do operational and human resource management capabilities affect the overall performance of private firms in Nigeria?

Research Hypotheses

Hypothesis 1 (H₀₁): There is no significant relationship between strategic management capability and the business performance of Nigerian private firms.

Hypothesis 2 (H₀₂): Leadership and decision-making capability do not have a significant impact on organizational productivity and profitability in Nigerian private firms.

Hypothesis 3 (H₀₃): Operational and human resource management capabilities do not significantly influence the overall business performance of Nigerian private firms.

Literature Review

Conceptual Review

Management Capability

Management capability refers to the collective skills, knowledge, and abilities of an organization's leadership to effectively plan, organize, lead, and control resources to achieve strategic objectives and enhance organizational performance. It encompasses various dimensions such as strategic planning, decision-making, leadership, and operational management. In dynamic and competitive environments, particularly in emerging economies like Nigeria, management capability is crucial for navigating challenges and seizing opportunities. Recent studies have highlighted the importance of management capability in influencing business outcomes. For instance, research indicates that managerial capabilities, including strategic planning and managerial skills, significantly impact the corporate performance of SMEs in Nigeria's agricultural sector Adeneye, (2024).. Additionally, the dynamic capabilities framework suggests that firms must continuously adapt, integrate, and reconfigure their internal and external competences to thrive in rapidly changing environments (Eisenhardt, & Martin, 2000). In the context of Nigerian private firms, enhancing management capability can lead to improved strategic alignment, better resource utilization, and increased competitiveness, ultimately contributing to sustained business performance.

Business Performance of Private Manufacturing Firms

Business performance in private manufacturing firms refers to the measurable outcomes that indicate how effectively a company achieves its strategic objectives, operational goals, and overall organizational success. It encompasses both financial and non-financial indicators, including profitability, revenue growth, productivity, market share, customer satisfaction, and innovation capacity (Ogunyomi & Bruning, 2020). Performance reflects the firm's ability to utilize resources efficiently, adapt to market changes, and sustain competitive advantage in dynamic environments. In the context of private manufacturing firms, business performance is often influenced by factors such as managerial competence, technological capability, operational efficiency, employee engagement, and market responsiveness. Studies suggest that firms that integrate strategic planning with operational execution tend to demonstrate superior performance outcomes (Adeniran & Osabuohien, 2021). Furthermore, business performance is multidimensional, with financial measures capturing profitability and growth, while operational measures reflect productivity, quality, and innovation effectiveness (Abdullah et al., 2022). Measuring business performance in private manufacturing firms is critical for decision-making, resource allocation, and assessing organizational sustainability. High-performing firms are better positioned to survive economic volatility, exploit growth opportunities, and maintain long-term competitiveness, making business performance a key indicator of organizational health and strategic effectiveness (Onugu, 2020).

Strategic management capability influence the business performance of Nigerian private manufacturing firms

Strategic management capability encompasses the ability of an organization to formulate, implement, and evaluate strategies that align with its objectives and the external environment. In Nigerian private manufacturing firms, this capability is crucial for navigating the challenges posed by economic volatility, regulatory changes, and competitive pressures. Research indicates that effective strategic management practices significantly enhance business performance by improving operational efficiency, profitability, and market competitiveness. A study by Agwu (2018) found that the adoption of strategic management practices among small and medium-sized enterprises (SMEs) in Lagos State led to increased transaction volumes, customer numbers, and market share, thereby improving overall business performance. Similarly, research by Ogbaini (2024) highlighted that strategic orientation positively affects the performance of

manufacturing firms in Nigeria, with innovation, organizational structure, and leadership serving as moderating factors.

Furthermore, a study by Badiru (2024) emphasized the importance of strategic management controls in enhancing operational performance. The research identified that strategic cost management practices, such as activity-based costing and target costing, positively impact firm performance by improving cost efficiency and resource utilization. These findings underscore the importance of strategic management capability in fostering sustainable business performance in Nigerian private manufacturing firms. By effectively aligning internal capabilities with external opportunities and threats, firms can achieve competitive advantage and long-term success.

Leadership and decision-making capability on organizational productivity and profitability

Leadership encompasses the ability to guide, influence, and inspire employees towards achieving organizational goals. In Nigerian manufacturing firms, leadership styles such as transformational and democratic have been associated with positive organizational performance. For instance, a study by Onu (2024) found that strategic leadership positively impacts organizational performance in Nigerian manufacturing firms. Similarly, Ezeanolue and Ezeanyim (2020) highlighted that employee participation in decision-making, a facet of leadership, enhances organizational productivity in manufacturing firms in South-East Nigeria.

Decision-Making Capability and Organizational Performance

Decision-making capability refers to the ability to make informed, effective, and timely decisions that steer the organization towards its objectives. In the context of Nigerian manufacturing firms, strategic decision-making is crucial for navigating market uncertainties and achieving competitive advantage. Research by Olasanmi (2021) indicates that strategic management practices, which include decision-making processes, significantly influence organizational performance in Nigerian manufacturing firms.

Integrating Leadership and Decision-Making Capability

The integration of strong leadership and robust decision-making capabilities creates a synergistic effect that enhances organizational productivity and profitability. Leaders who empower employees to participate in decision-making processes foster a sense of ownership and commitment, leading to improved performance outcomes. Moreover, effective decision-making ensures that the organization responds adeptly

to internal and external challenges, thereby sustaining profitability. In conclusion, the interplay between leadership and decision-making capability plays a critical role in determining the productivity and profitability of Nigerian private manufacturing firms. Strengthening these areas can lead to enhanced organizational performance, enabling firms to thrive in a competitive and volatile business environment.

Operational and human resource management capabilities affect the overall performance of private firms in Nigeria

Operational and human resource management (HRM) capabilities are critical determinants of the overall performance of private firms in Nigeria. These capabilities influence various performance metrics, including productivity, profitability, and competitiveness, particularly within the manufacturing sector.

Operational Capability and Firm Performance

Operational capability refers to a firm's ability to efficiently manage its production processes, supply chain, quality control, and resource utilization. In Nigeria, firms that invest in enhancing their operational capabilities often experience improved performance outcomes. For instance, research indicates that organizations employing operational performance benchmarking have achieved up to a 30% increase in operational effectiveness, leading to enhanced productivity and reduced costs Novatia Consulting.

Human Resource Management Capability and Firm Performance

HRM capability involves the strategic management of human capital through practices such as recruitment, training, development, and performance management. Studies have shown that effective HRM practices positively impact firm performance. A study by Elumah et al. (2017) found a significant relationship between HRM practices and organizational performance in Nigerian firms, highlighting the importance of HRM in enhancing productivity and profitability ResearchGate.

Integrated Impact on Performance

The integration of strong operational and HRM capabilities creates a synergistic effect that enhances overall firm performance. Firms that align their operational strategies with effective HRM practices are

better positioned to adapt to market changes, innovate, and achieve sustainable growth. This integrated approach enables firms to leverage their human capital effectively, streamline operations, and maintain a competitive edge in the Nigerian market.

Tools and Methods

This study adopts a quantitative cross-sectional survey design to examine the relationship between management capabilities and business performance in Nigerian private firms. The independent variables—Strategic Planning and Decision-Making, Leadership and Human Resource Management, and Operational and Adaptive Competence—were assessed against business performance, measured through profitability, productivity, market share, and operational efficiency (Creswell & Creswell, 2018). Data were collected from private firms in Lagos, Ogun, and Rivers States, selected for their industrial diversity and workforce heterogeneity (Adewale & Ojo, 2020). The population comprised employees and managers, with a sample of 317 respondents determined using Yamane's (1967) formula and selected via stratified random sampling based on job roles (Etikan et al., 2016). Primary data were obtained through structured questionnaires using a 5-point Likert scale, while secondary data included company reports and HR records to validate responses (Saunders et al., 2019). Validity was confirmed by management and HR experts, and reliability was ensured through a pilot test, achieving Cronbach's alpha ≥ 0.70 (Amin, 2020; Nunnally & Bernstein, 1994). Data were analyzed using descriptive statistics (frequencies, means, standard deviations) and inferential statistics, including Pearson correlation and multiple regression, expressed as:

$$BP = \beta_0 + \beta_1 SPDMC + \beta_2 LHRMC + \beta_3 OAC + \epsilon$$

This methodology enables assessment of both the individual and combined effects of managerial capabilities on business performance, providing empirical insights into key drivers of organizational success in Nigerian private firms.

Data Presentation and Analysis

Demographic Analysis of Respondents

A total of **317 questionnaires** were returned, of which **17 were invalidated**, leaving **300 valid responses** for analysis. The respondents comprised employees and managers across Nigerian private firms in Lagos, Ogun, and Rivers States. Demographic characteristics are summarized in Table 4.1.

Table 1: Demographic Characteristics of Respondents (N = 300)

Demographic Variable	Category	Frequency	Percentage (%)
Gender	Male	180	60
	Female	120	40
Age	20–29	60	20
	30–39	120	40
	40–49	80	26.7
	50+	40	13.3
Job Role	CEO/Executive	30	10
	Manager	80	26.7
	Supervisor	90	30
	Staff	100	33.3
Experience (Years)	<5	50	16.7
	5–10	120	40
	11–15	80	26.7
	>15	50	16.7

Source: Authour’s field Analysis (2025)

Preliminary Analysis: Data Screening, Missingness & Reliability

The dataset was screened for completeness. No missing values were identified for key variables. Outliers were examined using standardized scores (Z-scores), with all cases falling within ± 3 , indicating no extreme deviations.

Reliability (Internal Consistency)

The reliability of scales was assessed using Cronbach’s alpha, with $\alpha \geq 0.70$ considered acceptable (Nunnally & Bernstein, 1994).

Table 2: Scale Reliability (Cronbach’s Alpha)

Construct	No. of Items	Cronbach’s α
Strategic Planning & Decision-Making	5	0.812
Leadership & HR Management	5	0.828
Operational & Adaptive Competence	5	0.795
Business Performance	7	0.841

Source: SPSS Analysis(2025)

All constructs demonstrated acceptable internal consistency, confirming the reliability of the instrument

Descriptive Statistics (Scale Level)

Table 3 shows the mean and standard deviation scores for the main variables.

Table 3: Descriptive Statistics

Variable	Mean	SD
Strategic Planning & Decision-Making	3.68	0.72
Leadership & HR Management	3.75	0.68
Operational & Adaptive Competence	3.62	0.70
Business Performance	3.70	0.65

Source: Author’s Analysis (2025)

The results indicate moderate to high perceptions of management capability **and** business performance among respondents.

Correlation Analysis

Pearson correlation was used to examine relationships between management capabilities and business performance.

Table 4: Pearson Correlation Matrix

Variable	1	2	3	4
1. Strategic Planning & Decision-Making	1			
2. Leadership & HR Management	0.682**	1		
3. Operational & Adaptive Competence	0.614**	0.655**	1	
4. Business Performance	0.578**	0.602**	0.543**	1

Note. $p < 0.01$ (2-tailed).

Results indicate moderate positive correlations between all dimensions of management capability and business performance

Regression Analysis — Testing Hypotheses

A multiple regression analysis assessed the predictive influence of management capability dimensions on business performance.

Table 5: Multiple Regression Analysis

Predictor Variable	B	SE B	β	t	p
Strategic Planning & Decision-Making	0.312	0.062	0.298	5.032	0.000
Leadership & HR Management	0.361	0.057	0.342	6.333	0.000
Operational & Adaptive Competence	0.254	0.060	0.234	4.233	0.000
Constant	0.512	0.149	—	3.434	0.001

Model Summary: $R^2 = 0.562$, $F(3, 296) = 127.54$, $p < 0.001$.

Interpretation:

- **Strategic Planning & Decision-Making** significantly predicts business performance ($\beta = 0.298$, $p < 0.001$).
- **Leadership & HR Management** has the strongest influence ($\beta = 0.342$, $p < 0.001$).
- **Operational & Adaptive Competence** also significantly affects performance ($\beta = 0.234$, $p < 0.001$). These results confirm that all three dimensions of management capability positively and significantly influence business performance, supporting the study hypotheses.

Discussion of Findings

- Influence of Strategic Planning Capability:** Strategic planning and decision-making capability are critical drivers of business performance in Nigerian private firms. This dimension of management capability encompasses the ability to anticipate market trends, allocate resources efficiently, set realistic organizational goals, and align departmental objectives with overall corporate strategy. Firms that exhibit strong strategic planning practices are better equipped to identify opportunities, mitigate risks, and make informed decisions that enhance profitability and market competitiveness. Effective strategic planning fosters organizational coherence, reduces operational redundancies, and enables firms to respond proactively to internal and external challenges. The findings of this study align with Obaji and Ogbari (2018), who assert that strategic foresight and structured planning are essential for sustaining performance in dynamic and competitive business environments. Furthermore, strategic planning capability reinforces long-term sustainability by ensuring that firms not only react to current market conditions but also position themselves advantageously for future growth.
- Impact of Leadership and Human Resource Management Capability:** Leadership and HR management capability emerged as the strongest predictor of organizational productivity and profitability in this study. Effective leadership entails

guiding teams, setting clear expectations, motivating employees, and fostering a culture of accountability and innovation. Complementarily, HR management capability involves talent acquisition, employee development, performance management, and creating policies that enhance employee engagement. Firms with robust leadership and HR practices tend to experience higher employee morale, reduced turnover, and improved operational efficiency. This finding is consistent with Adewale and Ojo (2020), who emphasize that leadership effectiveness and strategic HR management are pivotal in translating organizational resources into measurable business outcomes. By cultivating employee commitment, leadership and HR management capability indirectly support other management functions, strengthening overall organizational resilience and competitiveness.

Role of Operational and Adaptive Competence:

Operational and adaptive competence plays a crucial role in enhancing firm performance by enabling managers to execute organizational strategies effectively while adapting to changing market conditions. Operational competence involves optimizing processes, managing resources efficiently, and ensuring that organizational outputs meet quality and efficiency standards. Adaptive competence, on the other hand, refers to the ability to respond flexibly to technological innovations, regulatory shifts, and fluctuating consumer demands. Firms that demonstrate high levels of operational and adaptive competence can maintain productivity and performance even under uncertain conditions, reducing the risk of operational disruptions. The study's results support the observations of Elnaga and Imran (2021), who note that managerial flexibility and operational excellence are essential for sustaining business performance in dynamic and unpredictable markets. Together, operational and adaptive competencies complement strategic planning and leadership capabilities, forming a holistic managerial framework that drives organizational success. Overall, the findings indicate

that management capability is a key driver of business success in Nigerian private firms, with leadership effectiveness being the most influential dimension.

Summary

This study examined the relationship between management capability and business performance in Nigerian private firms, focusing on three core dimensions: strategic management capability, leadership and decision-making capability, and operational and human resource management capability. Using a quantitative research design, data were collected from 300 valid respondents across Lagos, Ogun, and Rivers States. Analyses included descriptive statistics, correlation, and multiple regression to test the study hypotheses. Findings revealed that all three dimensions of management capability have a significant positive impact on business performance. Strategic planning and decision-making capability enhances firms' ability to align resources and anticipate market changes. Leadership and HR management capability had the strongest effect, improving employee engagement, productivity, and profitability. Operational and adaptive competence also positively influenced overall business performance, highlighting the role of flexibility and effective resource management in a dynamic business environment.

Conclusion

The study concludes that management capability is a critical determinant of business performance in Nigerian private firms. Firms that demonstrate strong strategic foresight, effective leadership, and adaptive operational skills achieve higher profitability, productivity, and sustainability. Among the dimensions, leadership and decision-making capability emerged as the most influential, underscoring the pivotal role of human capital management in organizational success.

Recommendations

Based on the findings, the following recommendations are proposed:

Firms should invest in structured strategic planning processes and decision-making frameworks to improve responsiveness to market dynamics.

Organizations should implement leadership training and mentoring programs to improve managerial competence and employee engagement.

Firms should encourage adaptive operational practices and effective human resource management, including performance monitoring, workforce training, and resource optimization.

Regular evaluations of management skills should be conducted to identify gaps and improve overall organizational performance.

Ethical Leadership and Accountability in Nigeria's Public Service

EKPENI Ogechukwu Perpetual¹ & OFUNE Kelvin²

Department of Business Administration,
Dennis Osadebay University, Asaba, Delta State
ekpeniperpetual@gmail.com

Publication Date: 2025/11/28

Abstract

This qualitative study examines the critical relationship between ethical leadership and accountability in Nigeria's public service, exploring how ethical practices influence governance outcomes. The research identifies pervasive challenges including systemic corruption, lack of transparency, weak institutional frameworks, and political interference that undermine accountability mechanisms. Through content analysis of secondary sources including journal articles, government publications, and empirical studies, the investigation reveals that ethical failures in Nigeria's public service are multifaceted, stemming from historical precedents, organizational culture, and socioeconomic factors. The study establishes that ethical leadership characterized by integrity, accountability, transparency, and commitment to the public good is instrumental to achieving good governance and sustainable development. Findings indicate that transformational leadership approaches, coupled with strengthened institutional controls and cultural transformation, could significantly enhance accountability in the public sector. The research contributes to the existing literature by providing a comprehensive analysis of the interconnectedness between ethical leadership and accountability in the Nigerian context. Recommendations include institutional reforms, enhanced transparency mechanisms, leadership development programs, and the cultivation of an ethical organizational culture to promote accountability and good governance in Nigeria's public service.

Keywords: Ethical Leadership, Accountability, Public Service, Governance, Corruption, Nigeria

Introduction

The public service in Nigeria represents the institutional framework through which government policies are formulated and implemented, thereby serving as the engine room of governance and national development. Historically, Nigeria's public service has undergone significant reforms since the colonial period, with the 1976 reforms marking a major attempt to professionalize and enhance efficiency in the sector (Adebayo, 2020). Despite these reforms, the sector continues to grapple with challenges of inefficiency, politicization, and declining ethical standards. The concept of ethical leadership, which emphasizes principles such as transparency, accountability, integrity, and service to the public good, remains central to addressing these challenges and ensuring the proper functioning of public institutions (Okereke & Eme, 2022).

Nigeria's socioeconomic landscape reveals a paradox a country endowed with vast human and natural resources, yet consistently facing underdevelopment, poverty, and inequality. Scholars argue that this contradiction is strongly tied to governance deficits,

especially within the public service (Akinola, 2021). Issues such as nepotism, bribery, embezzlement, and bureaucratic bottlenecks have become entrenched, weakening institutional performance and eroding public confidence in government agencies. These unethical practices not only diminish service delivery but also stifle sustainable economic growth and social justice (Olowu & Oyedele, 2023).

The erosion of accountability in Nigeria's public service is a direct consequence of weak enforcement mechanisms and a culture of impunity among public officials. Studies show that accountability mechanisms such as audits, procurement monitoring, and anti-corruption frameworks are either poorly implemented or circumvented due to weak political will (Agbiboa, 2021). As a result, the credibility of the public service has been compromised, with the average citizen perceiving government institutions as self-serving rather than people-oriented. This situation underscores the urgency of embedding ethical leadership as a guiding principle in Nigeria's governance framework (Adeosun, 2022).

In the broader theoretical discourse, ethical leadership and accountability have gained global recognition as key determinants of public sector effectiveness. Theories such as Transformational Leadership Theory and Agency Theory emphasize the role of leaders in fostering accountability, ethical behavior, and alignment of personal interests with public goals (Brown & Treviño, 2020). However, the application of these frameworks in Nigeria remains underexplored, with existing literature offering limited insights into how ethical leadership can be systematically cultivated to combat entrenched corruption and inefficiency in public institutions (Eneh, 2022).

Against this backdrop, this study seeks to bridge the gap by critically examining the relationship between ethical leadership and accountability in Nigeria's public service. By drawing from empirical evidence, theoretical perspectives, and comparative global practices, the study aims to provide actionable recommendations for strengthening institutional frameworks. Ultimately, the research contributes to the broader debate on governance reform in Africa, highlighting the need for leadership models rooted in ethics, transparency, and accountability to achieve sustainable national development (Oluwatobi & Okafor, 2023).

Statement of the Problem

The Nigerian public service is bedeviled by a plethora of ethical issues that have severely compromised its accountability mechanisms and service delivery capacity. Despite numerous reforms and anti-corruption initiatives, systemic corruption remains entrenched in the public sector, manifesting through various forms including bribery, embezzlement of funds meant for developmental projects, falsification of government documents for selfish motives, and inflation of contract figures. These unethical practices have become so normalized that they now represent a significant impediment to Nigeria's socioeconomic development.

The magnitude of corruption and ethical violations was particularly evident during the COVID-19 pandemic, when public officials brazenly looted palliative materials meant for vulnerable populations during lockdown periods. This incident highlighted the profound ethical crisis within Nigeria's public service and raised serious questions about the effectiveness of existing accountability mechanisms. The persistence of such practices suggests deep-rooted systemic issues that go beyond individual moral failings to encompass institutional and structural deficiencies.

Several interconnected factors contribute to this problematic situation. General poverty among the populace creates an environment conducive to corruption, as public officials often seek alternative

means of supplementing their income. The politicization of the public service has led to the appointment of unqualified personnel based on patronage rather than merit, further eroding professionalism and ethical standards. Additionally, weak regulatory instruments and enforcement mechanisms have created a culture of impunity where ethical violations often go unpunished.

The consequences of these ethical failures are far-reaching and multifaceted. They include poor service delivery, inadequate infrastructure, weakened public institutions, diminished public trust, and ultimately, the perpetuation of poverty and underdevelopment despite Nigeria's abundant resources. This situation necessitates a thorough investigation into the root causes of ethical violations in Nigeria's public service and the identification of practical strategies for promoting ethical leadership and accountability.

Objectives of the Study

This research aims to comprehensively examine the phenomenon of ethical leadership and accountability in Nigeria's public service. The specific objectives are:

1. To investigate the perception and manifestation of ethical leadership within Nigeria's public service sector, examining the extent to which political leaders exhibit accountability and integrity as instruments of governance.
2. To identify and analyze the institutional and cultural factors that constrain ethical behavior and accountability in Nigeria's public service, including poverty, corrupt practices, weak regulatory frameworks, and organizational culture.
3. To propose evidence-based strategic recommendations for promoting ethical leadership and strengthening accountability mechanisms in Nigeria's public service, focusing on institutional reforms, cultural transformation, and leadership development.

Research Questions

To guide this investigation, the following research questions have been formulated:

1. To what extent do Nigeria's political leaders exhibit accountability and integrity as instruments of governance, and how are these ethical leadership qualities perceived by the public?
2. What are the primary institutional, cultural, and socioeconomic factors that constrain ethical behavior and accountability in Nigeria's public service?
3. What practical strategies and mechanisms can be implemented to promote ethical leadership and strengthen accountability in Nigeria's public service?

Conceptual Review

Ethical Leadership

Ethical leadership in public service is a foundational pillar for building trust and ensuring effective governance. It transcends mere compliance with rules, representing a holistic commitment to moral principles that guide both personal conduct and organizational culture. In today's complex environment, this involves navigating novel dilemmas such as digital privacy, algorithmic bias in automated public service delivery, and the ethical management of vast public datasets (Margetts & Dorobantu, 2019). The concept is not static; it evolves to meet new challenges, demanding that leaders be both morally aware and technically proficient to make decisions that are not only legal but also just and equitable for the citizens they serve. This is particularly critical in an era of deepfakes and misinformation, where public trust is fragile and easily eroded by perceived ethical lapses (Bennett & Livingston, 2018).

The conceptual dimensions of ethical leadership, while rooted in the "moral person" and "moral manager" framework, have been expanded to include a "moral entrepreneur" role in the digital age (Hassan, Wright, & Yukl, 2021). The moral person dimension focuses on the leader's individual character: their honesty, integrity, fairness, and trustworthiness, demonstrated through consistent personal actions. The moral manager dimension is outwardly focused, involving the active promotion of ethical conduct within the organization through clear communication, reinforcement, and holding subordinates accountable. A contemporary example of this duality can be seen in the leadership responses to crises; a leader who transparently acknowledges institutional failures (moral person) and then implements systemic reforms to prevent recurrence (moral manager) embodies both dimensions effectively.

In the Nigerian context, the relevance of ethical leadership is magnified by persistent challenges such as corruption, nepotism, and a historical deficit of public trust. The conceptualization of an ethical leader here must include the courage to resist deeply entrenched informal systems of patronage ("godfatherism") and to make decisions based solely on merit and public interest, a challenge documented in recent analyses of sub-national governance (Okafor & Fatile, 2022). This is exemplified by the ongoing efforts of agencies like the Independent Corrupt Practices and Other Related Offences Commission (ICPC), whose effectiveness is directly tied to the perceived ethical fortitude of its leadership. When such leaders actively "show and tell" their values, they begin to counteract a culture of cynicism and set a new standard for public service.

The practical application of ethical leadership faces significant hurdles, including political pressure,

cultural norms that may conflate loyalty with integrity, and a lack of robust protective mechanisms for whistleblowers. Conceptually, this suggests that ethical leadership cannot be viewed in isolation; it is interdependent with the broader governance ecosystem. For it to flourish, it must be supported by strong, impartial institutions and a vibrant civil society that is empowered to demand accountability, as evidenced by the mixed results of anti-corruption initiatives across Africa (Persson, Rothstein, & Teorell, 2023). Therefore, strengthening ethical leadership is not merely about training individuals but about systematically creating an environment that rewards ethical behavior and imposes tangible costs on ethical violations.

Accountability

Accountability is the bedrock of democratic governance, constituting the mechanisms through which public officials are held responsible for their actions, use of resources, and the outcomes they achieve. Its conceptual core involves three key elements: transparency (openness about actions), answerability (the obligation to justify decisions), and enforceability (the presence of meaningful sanctions for misconduct or poor performance). In the 21st century, the concept has been radically expanded by technology-enabled "social accountability," where citizens and civil society organizations use tools like open data platforms, social media activism, and crowdsourced monitoring to directly hold power to account, often bypassing sluggish or compromised formal channels (Peixoto & Sifry, 2017).

The conceptual framework of accountability operates through multiple, overlapping channels: political, legal, administrative, and professional. A robust system requires these horizontal (between state institutions) and vertical (from state to citizens) mechanisms to function in tandem. Contemporary scholarship emphasizes the rise of "diagonal accountability," a hybrid where civil society actors directly engage with and strengthen horizontal agencies like audit institutions and anti-corruption commissions (Peruzzotti & Smulovitz, 2022). For instance, the audit reports generated by the Office of the Auditor-General for the Federation (a horizontal mechanism) can be leveraged by the media and advocacy by groups like SERAP (social accountability) to pressure the Public Accounts Committees into action, creating a more potent multi-layered web of oversight.

In Nigeria, the conceptual ideal of accountability starkly contrasts with its practical application. While the framework exists on paper, the system is often weakened by politicization, institutional capture, and selective enforcement. A stark contemporary illustration is the persistent and well-documented delays by the National Assembly in reviewing and

acting upon the annual audit reports submitted by the Auditor-General, a critical failure that breaks the chain of answerability and enforceability (International Budget Partnership, 2023). This perpetuates a culture of impunity, where the likelihood of facing consequences for misappropriation is perceived as low, thus enabling both grand corruption and petty malfeasance alike.

Strengthening accountability conceptually requires moving beyond a focus solely on punitive, retrospective measures to building integrated, proactive systems that prevent misconduct. This includes leveraging technology for real-time transparency, such

as the Government Integrated Financial Management Information System (GIFMIS) and the Treasury Single Account (TSA), though their effectiveness is itself dependent on strong political will and technical capacity (Ojo, 2021). Furthermore, promoting performance-based accountability, which ties rewards and sanctions to measurable results and service delivery outcomes, can shift the focus from process to impact. Ultimately, a reconceptualization of accountability in Nigeria must address the underlying political economy factors that weaken institutions and foster an environment where unethical conduct is rationalized and often rewarded.

Conceptual Framework

This diagram illustrates a conceptual framework where Ethical Leadership serves as the foundational driver for effective governance. The components of ethical leadership such as integrity, transparency, and a commitment to the public interest directly enable the implementation of robust Accountability Mechanisms, including audits, performance monitoring, and citizen engagement. These mechanisms act as the critical link, translating ethical principles into tangible actions. Finally, the effective functioning of these accountability processes leads to desired Governance Outcomes, such as reduced corruption, improved public service delivery, and, ultimately, the cultivation of greater public trust. The framework demonstrates a clear causal pathway from leadership values to concrete results through the essential medium of accountability.

Theoretical Framework

Transformational Leadership Theory:

Transformational Leadership Theory, initially conceptualized by Burns (1978) and later expanded by Bass (1985), provides a foundational lens for analyzing leadership effectiveness, particularly in relation to

ethics and accountability. The theory posits that transformational leaders influence their followers by appealing to higher moral values and ideals rather than self-interest. Key components of this leadership style include idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Bass & Riggio, 2006). Through these dimensions, transformational leaders can create meaningful organizational change by shaping values, instilling purpose, and elevating follower commitment to collective goals.

In the Nigerian public service, where issues of corruption, weak institutional accountability, and leadership failures are recurrent, transformational leadership theory offers a compelling framework to understand how ethical leadership can be cultivated. Leaders who demonstrate authenticity, moral integrity, and a commitment to national service can inspire civil servants to emulate similar values, thereby improving institutional performance and public trust. According to Avolio and Walumbwa (2014), transformational leaders serve as ethical role models, which is particularly important in governance systems where leadership deficits are deeply entrenched.

Transformational leadership also aligns with the increasing call for public sector reform in developing countries, especially where leadership effectiveness is often undermined by systemic constraints. Studies such as those by Oreg and Berson (2019) have shown that transformational leadership significantly improves organizational citizenship behavior and reduces unethical practices in bureaucratic settings. In Nigeria's public service, this implies that civil servants who work under transformational leaders are more likely to resist corrupt practices, adhere to institutional regulations, and prioritize service delivery outcomes. This transformation is not only behavioral but cultural, embedding ethics and accountability into the core fabric of public institutions.

Moreover, the theory emphasizes the importance of intellectual stimulation, which encourages innovation and critical thinking in public service. Leaders who foster open dialogue and challenge traditional bureaucratic inefficiencies can empower employees to develop creative solutions to longstanding governance problems. As argued by Northouse (2021), such leadership approaches can shift organizational mindsets from passive rule-following to proactive engagement with public challenges. In the Nigerian context, where rigid hierarchies often stifle innovation, transformational leadership can serve as a catalyst for cultural change and institutional modernization.

In conclusion, Transformational Leadership Theory provides a robust theoretical foundation for exploring ethical leadership and accountability in Nigeria's public service. Its emphasis on moral leadership, inspirational vision, and follower development is particularly relevant in a governance context characterized by ethical lapses and institutional decay. Contemporary research underscores the theory's applicability to public sector reform, especially in environments where ethical leadership is urgently needed to rebuild trust and improve service delivery (Banks et al., 2016). This framework thus informs the current study's exploration of how ethical leadership can be operationalized to strengthen accountability mechanisms within Nigeria's public institutions.

Empirical Review

Several empirical studies have investigated the intersection of ethical leadership and accountability within Nigeria's public service, revealing deep-rooted systemic issues and the challenges confronting reform. Igbokwe-Ibeto and Osakede (2023) conducted a comprehensive assessment of ethical violations in Nigeria's public service, identifying persistent misconduct such as bribery, contract inflation, embezzlement, and document falsification. These malpractices were attributed to entrenched corruption, widespread poverty, weak enforcement mechanisms,

and the politicization of public offices. Their study emphasized the role of institutional failure in enabling unethical behavior and recommended reforms such as empowering professional bodies within the civil service, developing anti-crime tools, and strengthening accountability mechanisms across ministries and agencies.

In a related study, Ngare (2023) explored ethical leadership from the perspective of political accountability and found that successive Nigerian administrations consistently failed to institutionalize integrity and public engagement in governance. The study emphasized that public trust in government remains critically low due to leaders' reluctance to uphold transparency and include citizens in decision-making. Ngare concluded that accountability and integrity are not merely ethical virtues but fundamental requirements for sustainable governance. The research underscored that the absence of these values undermines policy legitimacy, disrupts service delivery, and fosters citizen apathy, thereby complicating the public sector reform agenda in Nigeria.

Further empirical evidence is provided by Okagbue (2011), whose research focused on ethical leadership and governance in Nigerian local governments. The study found that public servants overwhelmingly preferred leadership styles rooted in honesty, transparency, and citizen engagement. Civil servants interviewed during the study identified ethical leadership as a catalyst for enhanced service delivery and public confidence. Notably, the research revealed that ethical leadership can be a transformative force when linked with accountability, transparency, and participatory governance. These findings highlight the potential of ethical leadership not just to mitigate corruption, but to create an enabling environment for socioeconomic development and the effective utilization of public resources.

A more recent study by Orie and Egbe (2025) examined the implications of ethical leadership on sustainable development outcomes in Anambra State. The researchers found a direct correlation between strong ethical leadership, institutional governance, and successful implementation of development projects. The study noted that where transparency and stakeholder engagement were present, development outcomes were significantly more positive. Moreover, the research reinforced the idea that ethical leadership is foundational for ensuring long-term development and public trust. It recommended that government policies explicitly integrate ethical governance frameworks and leadership training for public officials to bridge the accountability gap and promote public sector efficiency.

Methodology

This study adopted a qualitative research design, specifically utilizing content analysis to explore the phenomena of ethical leadership and accountability within Nigeria's public service. A qualitative approach was chosen because it allows for an in-depth, contextual understanding of leadership behavior, institutional dynamics, and socio-cultural factors influencing governance. This method enables the researcher to critically engage with the meanings, themes, and patterns embedded within existing literature, policy documents, reports, and scholarly articles.

The content analysis technique involved the systematic review and interpretation of secondary data drawn from peer-reviewed journals, government publications, organizational reports, and existing empirical studies related to ethical leadership, public service accountability, and governance in Nigeria. Key search terms included "ethical leadership in Nigeria," "public service accountability," "governance challenges," and "transformational leadership in Africa." The documents were selected based on relevance, credibility, and recency (with a preference for sources published between 2010 and 2025), ensuring that the findings are grounded in contemporary evidence and perspectives.

This methodology enabled the researcher to identify recurring themes such as integrity deficits, weak regulatory frameworks, politicization of leadership, and cultural constraints within Nigeria's public institutions. Moreover, the qualitative design provided room to compare and synthesize findings from different authors and regions within Nigeria, revealing both systemic patterns and contextual specificities. Through this process, the study was able to derive strategic recommendations informed by real-world challenges and supported by scholarly consensus.

The data analysis process involved thematic coding, where recurring ideas, narratives, and findings were organized into categories aligned with the study's objectives namely, the perception of ethical leadership, institutional and cultural constraints, and recommendations for promoting accountability. This method facilitated a structured interpretation of qualitative data while preserving the richness of contextual insights.

Overall, the chosen methodology allowed the study to explore ethical leadership and accountability not just as abstract concepts, but as lived realities in Nigeria's public service. The reliance on well-documented secondary data enhanced the credibility of findings and ensured that recommendations were grounded in established knowledge and current governance debates.

Data Sources and Collection

This study utilized a broad range of secondary sources to explore ethical leadership and accountability in Nigeria's public service. Materials reviewed included peer-reviewed journal articles, textbooks, newspapers, government publications, magazines, and empirical studies relevant to public sector ethics and governance. These sources were identified through systematic searches of academic databases such as Google Scholar, JSTOR, and Scopus, using keywords like "ethical leadership in Nigeria," "public accountability," and "transformational leadership." Emphasis was placed on literature published between 2010 and 2025 to ensure the inclusion of current data and insights.

Additionally, manual reviews of reference lists were conducted to identify further relevant materials. The selected documents were evaluated for relevance, credibility, and academic rigor, providing a comprehensive base for qualitative content analysis. This method allowed the study to critically synthesize existing knowledge, highlight patterns, and offer insights into the challenges and opportunities for promoting ethical leadership and accountability in Nigeria's public service.

Data Analysis

The collected data were analyzed using qualitative content analysis, involving a systematic process of identifying, coding, and categorizing patterns and themes related to ethical leadership and accountability. This approach enabled the reduction of extensive data into manageable themes, allowing for meaningful interpretation and inference. The analysis focused on both manifest content, which refers to the directly observable information, and latent content, which involves uncovering the underlying meanings and contextual nuances. Through ongoing engagement with the source materials, the study ensured the reliability of its interpretations and developed a comprehensive understanding of the complex phenomena under investigation.

Ethical Considerations

The research adhered to ethical standards for secondary data analysis by appropriately acknowledging all sources through proper citations and references. Intellectual honesty and integrity were maintained throughout the study by accurately representing the findings and arguments from the source materials, ensuring there was no misrepresentation or manipulation of information. This careful attention to ethical considerations upheld the credibility and reliability of the research.

Discussion of Findings

The analysis of secondary sources revealed several key findings regarding ethical leadership and accountability in Nigeria's public service:

Pervasive Ethical Violations and Systemic Corruption:

The study confirmed the existence of widespread ethical violations in Nigeria's public service, ranging from petty corruption to grand misappropriation of public funds. These violations have become institutionalized and normalized within the system, creating a culture where ethical conduct is often the exception rather than the norm. The pervasiveness of corruption has significantly undermined public trust in government institutions and impaired the effectiveness of service delivery. Particularly concerning was the finding that ethical violations persisted even during emergency situations such as the COVID-19 pandemic, when public officials looted palliative materials meant for vulnerable populations. This demonstrates the depth of the ethical crisis within Nigeria's public service and suggests that existing accountability mechanisms are insufficient to deter misconduct, especially among those in leadership positions.

Weak Institutional Frameworks and Enforcement Mechanisms:

A critical finding of this study is the weakness of institutional frameworks designed to promote ethical conduct and ensure accountability in Nigeria's public service. Although Nigeria has established various institutions and regulations to combat corruption and enforce accountability, these mechanisms have proven ineffective due to political interference, inadequate resources, and weak enforcement capacity. The study revealed that regulatory capture has been a significant problem, with political leaders often interfering with the operations of accountability institutions to protect themselves and their allies from scrutiny. This has created a culture of impunity where public officials can engage in ethical violations with minimal fear of consequences. Additionally, the judicial system has been compromised in many cases, further weakening the accountability framework.

Socioeconomic and Cultural Factors Enabling Ethical Violations:

The research identified several socioeconomic and cultural factors that contribute to ethical violations in Nigeria's public service. General poverty among the population has created pressure on public officials to seek alternative means of income generation, often through corrupt practices. The politicization of the public service has led to the appointment of unqualified personnel based on patronage rather than merit, further

eroding professionalism and ethical standards. Additionally, the study found that the legacy of colonial administration continues to influence ethical practices in Nigeria's public service. The colonial administration was characterized by authoritarianism and extraction rather than service to the public, and elements of this legacy persist in contemporary administrative practices. This historical context helps explain why ethical leadership and accountability have been difficult to institutionalize in Nigeria's public service.

Leadership Failure and Erosion of Public Trust:

The study documented a crisis of leadership in Nigeria's public service, with successive political leaders failing to exemplify accountability and integrity in governance. This leadership failure has had a trickle-down effect throughout the public service, creating an environment where ethical violations are tolerated and even expected. The erosion of public trust has been both a cause and consequence of unethical leadership, as citizens' diminishing faith in public institutions reduces their willingness to hold leaders accountable while also justifying further ethical violations by public officials. This vicious cycle has been difficult to break, as each generation of leaders seems to perpetuate the patterns of misconduct established by their predecessors.

Conclusion

This study has examined the critical issues of ethical leadership and accountability in Nigeria's public service, revealing a complex web of challenges that have significantly impaired the effectiveness of governance and service delivery. The research demonstrates that ethical violations are pervasive and systemic, ranging from petty corruption to grand misappropriation of public funds. These violations are facilitated by weak institutional frameworks, socioeconomic factors, and a culture of impunity that has developed over decades.

The interrelationship between ethical leadership and accountability has been clearly established, with weaknesses in both areas creating a vicious cycle that undermines good governance. Ethical leadership is essential for establishing the moral tone and cultural norms that support accountability, while robust accountability mechanisms are necessary to reinforce ethical leadership by providing consequences for violations. The absence of both elements in Nigeria's public service has resulted in poor service delivery, weakened institutions, diminished public trust, and ultimately, the perpetuation of poverty and underdevelopment despite Nigeria's abundant resources. The study concludes that addressing the challenges of ethical leadership and accountability in Nigeria's public

service requires a comprehensive approach that addresses both individual and institutional dimensions. Transformational leadership that inspires ethical conduct must be complemented by institutional reforms that create effective accountability mechanisms. Additionally, socioeconomic factors that enable corruption must be addressed through broader policy interventions aimed at poverty reduction and the promotion of inclusive development.

Recommendations

Based on the findings of this study, the following recommendations are proposed to enhance ethical leadership and accountability in Nigeria's public service:

1. **Institutional Strengthening:** Public institutions responsible for ensuring accountability should be strengthened with adequate resources, operational independence, and protected mandates to minimize political interference. This includes anti-corruption agencies, audit institutions, and the judiciary. Specifically, legislation protecting these institutions from political manipulation should be enacted and enforced.
2. **Leadership Development and Ethics Training:** Comprehensive leadership development programs incorporating ethics training should be implemented at all levels of the public service. These programs should emphasize the principles and practices of ethical leadership, focusing on values such as integrity, transparency, and accountability. Such training should be mandatory for all public officials, particularly those in leadership positions.
3. **Transparency and Open Government Initiatives:** The government should implement robust transparency initiatives including open data platforms, public access to information, and citizen engagement mechanisms. The Open Tendering System for government contracts implemented in Anambra State represents a good practice that could be scaled nationally to reduce corruption in public procurement.
4. **Performance Management and Accountability Systems:** Effective performance management systems

with clear metrics and consequences for non-performance should be established throughout the public service. These systems should link performance evaluation to rewards and sanctions, creating incentives for ethical conduct and discouraging violations.

5. **Socioeconomic Reforms:** Broader socioeconomic reforms addressing poverty and inequality should be implemented to reduce the pressures that contribute to corrupt practices. This includes reviewing the compensation structure for public servants to ensure living wages that reduce the temptation for unethical supplementation of income.

Suggestions for Further Study

Based on the limitations and findings of this research, the following areas are recommended for further investigation:

1. **Comparative Studies:** Research comparing ethical leadership and accountability mechanisms in Nigeria's public service with those of other countries (both within and outside Africa) could provide valuable insights into context-specific and transferable solutions.
2. **Sector-Specific Analyses:** Studies focusing on specific sectors of Nigeria's public service (such as health, education, or security) could reveal sector-specific challenges and opportunities for promoting ethical leadership and accountability.
3. **Longitudinal Research:** Investigations tracking changes in ethical leadership and accountability practices over time would help assess the effectiveness of interventions and reforms aimed at addressing these issues.
4. **Quantitative Assessments:** Research employing quantitative methods to measure the prevalence and impact of ethical violations would provide valuable data for evidence-based policy formulation and resource allocation.
5. **Intersectional Studies:** Examinations of how factors such as gender, ethnicity, and religion intersect with ethical leadership and accountability practices could reveal important insights for targeted interventions.

Remote Work Challenges and Opportunities for Enhancing Employee Responsiveness in Bonny's Oil and Gas Sectors

OWHORJI, Sunday

Department of Business Administration,
Faculty of Administration and Management
Rivers State University, Nkpolu-Oroworukwo Port Harcourt
sunday.owhorji@ust.edu.ng

Publication Date: 2025/11/28

Abstract

This study investigated the relationship between remote work and employee responsiveness within the bonny oil and gas sector. Specifically, it examined how teleworking relates to three measures of employee responsiveness: flexibility, speed, and adaptability. A correlational research design was used, with data collected from 186 employees using a structured questionnaire. The Pearson Product Moment Correlation Coefficient was used to analyze the relationships between the variables. The findings showed a significant positive relationship between remote work and employee responsiveness. The study concludes that remote work arrangements can enhance employee responsiveness in the oil and gas industry, suggesting that organizations should strategically implement flexible work models to improve performance. Based on these findings, the study recommends that oil and gas companies: Develop comprehensive policies for teleworking, clearly defining eligibility, performance expectations, and communication protocols. Promote hybrid work models to balance operational needs with employee flexibility. Establish performance monitoring and feedback systems to continually evaluate the effectiveness of remote work arrangements.

Keywords: Remote Work, Teleworking, Employee Responsiveness, Flexibility, Speed, Adaptability.

Introduction

The modern business environment is characterized by rapid and constant change, which can quickly make traditional plans obsolete. To remain effective and competitive, organizations must prioritize responsiveness at every level of operation (Lin & Wu, 2011). Responsiveness allows employees to adapt their behaviors and actions to advance value, making it critical for the survival and success of any business (Proctor, 2018). It encourages operational and administrative flexibility, enabling organizations to quickly detect market changes, reconfigure processes, and adopt new technologies ahead of competitors (Hoyt, Huq & Kreiser, 2007). Responsive employees not only adapt to change but also create new opportunities (Emen, Nahseren & Quiclear, 2012). Remote work is a working style that allows professionals to perform their duties outside a traditional office setting. This approach is built on the idea that work doesn't require a specific location to be completed successfully (Thorstensson, 2020). Instead of commuting to a designated desk, remote employees

can complete projects from anywhere, giving them the flexibility to better integrate their professional and personal lives. This can lead to benefits such as improved work-life balance, access to more career opportunities, and reduced commuting costs. These arrangements can increase employee satisfaction, boost productivity, and generate cost savings for the organization.

The benefits of remote work are widely acknowledged. Flexible scheduling, for instance, gives employees autonomy in planning their daily lives (Lupu, 2017). Other benefits include the freedom to adjust work hours, work a compressed week, or schedule personal appointments during the day, which can reduce absenteeism and stress (Wienclaw, 2019). These factors can also help mitigate the impact of adverse weather and reduce health-related issues (Lupu, 2017). Despite the growing literature on this topic, many studies have not fully explored the potential of remote work as a solution to common organizational challenges. This study aims to fill that gap.

Problem Statement

A significant problem facing many oil and gas firms in Nigeria is a lack of employee responsiveness. This is reflected in the inability of some companies to meet the evolving demands of their market and environment. According to Team (2023), approximately 80% of businesses in Nigeria fail within nine years, a failure rate often attributed to a firm's inability to keep pace with market changes. This lack of responsiveness stems from a deficit in flexibility, speed, and adaptability, which are often linked to a lack of effective remote work policies, poor use of information technology, and ineffective process management. These deficiencies have been associated with increased cases of cybercrime, poor service delivery, and a decline in

profitability and competitiveness (Pehrsson, 2014). This study addresses the crucial question of how organizations can effectively tackle this issue.

Purpose of the Study

The primary purpose of this study is to empirically examine the relationship between remote work (specifically teleworking) and employee responsiveness (measured by flexibility, speed, and adaptability) in oil and gas firms in Bonny, Nigeria.

Conceptual Framework

The conceptual framework for this study is as follows; Predicting Variable: Remote Work (Teleworking); Criterion Variable: Employee Responsiveness (Flexibility, Speed, and Adaptability)

Fig. 1.1: Conceptual framework for remote work and employee responsiveness

Source: Jack Nilles (1988).

Literature Review and Theoretical Framework

Theoretical Framework: Self-Efficacy Theory

This study is grounded in Self-Efficacy Theory, a core component of Bandura's (1986) broader social cognitive theory. The theory posits that an individual's behavior, environment, and cognitive factors are interconnected. Specifically, it suggests that an employee's belief in their ability to perform remote work tasks (their self-efficacy) directly influences their effort, persistence, and, ultimately, their performance. By increasing employees' self-efficacy regarding remote work, organizations can potentially improve their outcomes. This theoretical lens is particularly relevant because remote work requires a high degree of self-discipline, motivation, and the belief that one can successfully manage tasks independently. The theory's

emphasis on how past successes and failures shape an individual's mastery expectations provides a valuable framework for understanding how employees adapt and perform in a remote setting.

Conceptual Review

Remote Work

Also known as distance working or telework, remote work is an arrangement where employees carry out their job responsibilities from a location other than the conventional office. This typically involves using digital communication and collaboration tools such as video conferencing, email, and project management software. As Elshaiekh et al. (2018) noted, remote workers often exhibit a high degree of self-discipline and are motivated by factors like proximity to family or a desire for social distancing. The concept aligns with Flexibility Firm Theory (Rodgers, 1992), which argues that workers experience greater flexibility when working from home, enabling them to better manage personal and professional responsibilities.

Employee Responsiveness

Employee responsiveness is a crucial organizational capability that reflects how quickly and effectively employees react to changes in the business environment to capitalize on opportunities (Bernardes & Hanna, 2009). It involves the ability to sense, interpret, and act on market stimuli (Garrett, Covin & Slevin, 2009). This study examines three key dimensions of employee responsiveness:

Employee Flexibility: This is the ability of employees to alter and adjust their operations in response to changing environmental demands (Homburg et al., 2007). It represents the availability of choices for how, when, and where employees engage in their work (Hill et al., 2008).

Employee Speed: This refers to the pace of an employee's operations and processes. It signifies their capacity to increase the speed of their work to meet service demands and environmental changes (Homburg et al., 2007).

Adaptability: This is a facet of resilience that encompasses the ability to learn, experiment with new solutions, and develop broad responses to various challenges (Walter et al., 2006). It is the inclination to maintain an experimental attitude and act in line with changing circumstances (Bowden, 1946).

Empirical Review

Remote Work and Employee Flexibility: The emergence of digital technology has enabled organizations to adopt remote work, which, in turn, has been associated with greater employee flexibility (Spreitzer et al., 2017). This is supported by the notion that working from home allows employees to better balance family and work responsibilities (Kaur, Malhotra, & Sharma, 2020). However, the direct correlation remains a subject of debate, which this study were investigate.

Remote Work and Employee Speed: Several studies suggest remote workers experience fewer interruptions, leading to increased focus, speed, and overall job performance (Grant & Campbell, 2020). Remote work also provides a sense of control and can improve time management by reducing commuting (Kossek et al., 2019; Bai et al., 2021). The hypothesis that remote work positively impacts employee speed was examined.

Remote Work and Employee Adaptability: Remote work can foster a sense of autonomy and adaptability by giving employees greater control over their schedules and processes (Fukumura et al., 2021). However, some research highlights challenges like blurred boundaries between work and home life, which can negatively impact adaptability. This study explore whether the benefits of increased autonomy outweigh these challenges in the context of employee adaptability.

Methodology

Research Design

This study will use a correlational research design to examine the relationship between remote work (the predictor variable) and employee responsiveness (the criterion variable). This design is suitable for quantifying the strength and direction of the relationship between variables, and it provides a systematic approach for data analysis using statistical tools like the Pearson Product Moment Correlation Coefficient.

Population and Sampling

The population for this study consists of employees of five selected oil and gas firms in Bonny, Rivers State. A sample of 384 respondents was drawn from this population. This sample size is considered representative and was determined using the Taro Yamane and Bowley's (1969) sampling formulas. The sample was proportionately distributed across the selected firms. The unit of analysis is the individual employee, who is considered best positioned to provide accurate and relevant data.

Data Collection

Primary data was the main source of information for this study. Data was collected using a structured questionnaire as the principal instrument.

Validity and Reliability

The research instrument was subjected to validity tests, including content and construct validity, to ensure it accurately measures the intended concepts. Reliability will be assessed using the Cronbach's alpha coefficient, a statistical measure of internal consistency.

Table 3.1 Result of Reliability Test

Variables	No of items	Alpha value
Teleworking	4	0.874
Employee Flexibility	4	0.925
Employee Speed	4	0.765
Employee Adaptability	4	0.875

Source: SPSS Output, 2025

Descriptive Statistics

Descriptive statistics were used to summarize and describe the basic features of the data. This includes demographic and univariate data. Demographic data refers to characteristics of the study participants, such as age, gender, or location. Univariate data involves the analysis of a single variable at a time, like the average score on a test. Descriptive statistics provide simple summaries about the sample and what the data shows, without making conclusions beyond the analyzed data itself. Common descriptive statistics include:

Measures of central tendency: mean, median, and mode;
Measures of variability: standard deviation, variance, and range, and Frequency distributions: tables and graphs showing how often different values occur.

Inferential Statistics

Results

Field Report

Table 4.1: Questionnaire Distribution and Recovery

Oil and Gas Sector	Questionnaire Disseminated	Not Retrieved	Retrieved and usable copies
Bonny oil and gas terminal	46	3	43
Bonny oil and gas terminal	19	-	19
Nigeria LNG Plant	55	4	51
Mazigan Limited	26	1	25
Tides Oil & Gas	50	2	48
Total	196	10	186

Source: Fieldwork, (2025)

A total of 196 questionnaires were distributed. Of these, 186 were returned and used for analysis, resulting in a retrieval rate of approximately 95%. Ten questionnaires were not retrieved because the respondents were unable to complete them.

Inferential statistics were used to make inferences and draw conclusions about a larger population based on the sample data. This method was used to establish the nature and direction of the relationship between variables. For example, inferential statistics could be used to determine if there is a statistically significant relationship between the amount of time spent studying and a student's test score, and if that relationship is positive (as one increases, the other increases) or negative (as one increases, the other decreases). Common inferential statistical techniques include:

Correlation analysis: measures the strength and direction of a linear relationship between two variables.

Regression analysis: predicts the value of a dependent variable based on one or more independent variables.

Hypothesis testing: includes t-tests, ANOVA, and chi-square tests, which are used to determine if there is enough evidence in a sample to conclude that a certain condition is true for the entire population.

Findings on Remote Work (Predictor Variable)

The survey results on teleworking, a dimension of remote work, indicate a generally positive perception among employees.

Work-Life Control: A strong majority of respondents felt that teleworking provides control over their work

time and family life. Specifically, 81.4% (156 out of 192) either strongly agreed or agreed with this statement.

Minimal Interference: Responses were mixed regarding interruptions. While a total of 60.2% (115 out of 192) agreed or strongly agreed they experience little interference, a significant minority of 30.8% (59 out of 192) disagreed or strongly disagreed.

Effective Use of Working Hours: A very high percentage of respondents, 78.6% (151 out of 192), agreed or strongly agreed that their working hours were used effectively.

Sense of Independence: Most respondents, 63% (121 out of 192), felt a sense of independence with teleworking.

Findings on Employee Responsiveness (Criterion Variable)

This section presents findings on the three dimensions of employee responsiveness: flexibility, speed, and adaptability.

Employee Flexibility

The results suggest that employees perceive their firm as being highly flexible.

Operational Agility: 81.3% (156 out of 192) of respondents agreed or strongly agreed that the firm can effectively alter its operations.

Behavioral Dynamics: A strong majority of 70.3% (135 out of 192) agreed or strongly agreed that the firm is dynamic in its behavior and disposition to change.

Business Process Change: A solid 63% (121 out of 192) of respondents agreed or strongly agreed that the firm can change its approach to business functions and processes.

Relationship Building: A total of 63% (121 out of 192) of respondents agreed or strongly agreed that the firm builds relationships to advance operational alternatives.

Employee Speed

Statement Items and Analyzed Responses on Teleworking

	N	Minimum	Maximum	Mean	Std. Deviation
I control my working time and family life	186	1	5	3.95	1.119
I experience little interference and interruptions,	186	1	5	3.33	1.443
My working hours is used effectively	186	2	5	4.17	.988
I feel independence with teleworking	186	1	5	3.62	.964
Valid N (listwise)	186				

Source: SPSS Output, 2025

The findings on employee speed were generally positive, with some variation.

Prompt Decision-Making: A total of 70.3% (135 out of 192) of respondents agreed or strongly agreed that decision-making is prompt.

Work Velocity: 63% (121 out of 192) of respondents agreed or strongly agreed that work is done quickly.

Pace with Change: A solid 63% (121 out of 192) of respondents agreed or strongly agreed that the organization maintains pace with changes.

Meeting Customer Needs: A total of 58.3% (112 out of 192) of respondents agreed or strongly agreed that agility is leveraged to meet customer needs.

Employee Adaptability

The results on employee adaptability were largely positive, with a very high level of agreement on one key point.

Creating Changes: A significant majority of 70.3% (135 out of 192) of respondents agreed or strongly agreed that adaptability allows for creating changes.

Concern-Driven Organization: The responses were more divided on this item. While 47.9% (92 out of 192) agreed or strongly agreed, a substantial percentage of 25.5% (49 out of 192) disagreed or strongly disagreed.

Resilience to Change: An overwhelming 81.3% (156 out of 192) of respondents agreed or strongly agreed that employees are resilient to sensitive changes.

Competitive Advantage: A total of 56.2% (108 out of 192) of respondents agreed or strongly agreed that the organization creates advantages over less adaptive competitors.

Univariate Data Analysis

The study uses the mean value thresholds established by Asawo (2009) to interpret the data. The benchmark for a positive or favorable response is a mean score of 3.00 or higher.

Low: Mean (M) between 1.0 and 2.4; Moderate: Mean (M) between 2.5 and 3.4; High: Mean (M) between 3.5 and 4.4; and Very High: Mean (M) of 4.5 and above.

The study found a general consensus among employees that teleworking improves the effective use of working hours ($M = 4.17$) and provides them with a sense of independence (mean values > 3.50). This suggests that employees feel more productive and autonomous when working remotely.

Areas of Concern

Despite the perceived benefits, there is a notable challenge with interruptions and interference during teleworking ($M = 3.33$). The lower mean score and high standard deviation ($SD = 1.443$) indicate that experiences with interruptions vary significantly among employees. This suggests that while some employees may find their remote environment distraction-free, others face considerable challenges, impacting their ability to concentrate.

Statement Items and Analyzed Responses on Employee Flexibility

	N	Minimum	Maximum	Mean	Std. Deviation
My firm is able to effectively alter its operations	186	1	5	4.08	1.000
My firm is dynamic in its behaviour and disposition to change	186	1	5	3.87	1.327
My firm is able to change its approach to business functions and processes	186	1	5	3.68	1.240
My firm builds on relationships in advancing its alternatives to actions and operations	186	1	5	3.51	1.384
Valid N (listwise)	186				

Source: SPSS Output, 2025

Mean scores for Employee Flexibility items ranged from **3.51 to 4.08**., Highest mean: *“My firm is able to effectively alter its operations”* (**$M = 4.08$, $SD = 1.000$**). Lowest mean: *“My firm builds on relationships in advancing its alternatives to actions and operations”*

(**$M = 3.51$, $SD = 1.384$**).

Employees mostly agree that their firms adapt operationally when needed, but are slightly less certain about relationship-building for adaptability (lower mean of 3.51 with more variability in views).

Statement Items and Analyzed Responses on Employee Flexibility

	N	Minimum	Maximum	Mean	Std. Deviation
Decision-making is prompt in my firm	186	2	5	3.95	.955
In my organization work is done quickly	186	1	5	3.84	1.250

In my organization we maintain pace with changes in our work environment	186	1	5	3.67	1.373
In my organization we leverage on agility as a major capacity in meeting customer needs	186	1	5	3.53	1.253
Valid N (listwise)	186				

Source: SPSS Output, 2025

Mean scores for speed items ranged from **3.53** to **3.95**. Highest mean: “*Decision-making is prompt in my firm*” (**M = 3.95, SD = 0.955**). Lowest mean: “*We leverage agility to meet customer needs*” (**M = 3.53,**

SD = 1.253). Employees agree that prompt decision-making is strength. However, agility as a deliberate strategy for meeting customer needs is slightly less emphasized (lower mean, more spread in responses).

Statement Items and Analyzed Responses on Employee Adaptability

	N	Minimum	Maximum	Mean	Std. Deviation
Adaptability allow us to create changes	186	1	5	3.94	1.396
In my organization we are driven by concern	186	1	5	3.32	1.240
We are resilient to sensitive changes in my organization	186	1	5	3.97	.947
We create advantages over less adaptive competitors in my organization	186	1	5	3.66	1.185
Valid N (listwise)	186				

Source: SPSS Output, 2025

Mean scores for adaptability-related competitive advantage items ranged from **3.32** to **3.97**. Highest mean: “*We are resilient to sensitive changes in my organization*” (**M = 3.97, SD = 0.947**). Lowest mean: “*In my organization we are driven by concern*” (**M = 3.32, SD = 1.240**).

Resilience to changes is seen as strength (high mean

and low standard deviation). However, concern-driven motivation is rated lower and more variable, suggesting different experiences among employees.

Scatter Plot Showing a Positive Relationship between Remote Work and Employee Responsiveness of Oil and Gas Firms Bonny, Nigeria

Figure 4.6: Scatter diagram of the positive relationship between remote work and employee responsiveness

As obviously indicated in the diagram above, the dependent variable being employee responsiveness was plotted on the Y-axis while the independent variable being remote work was plotted on the X-axis. The apparent cases in the scatter plot sloping upwards from left to right display the existence of a linear as well as positive relationship between the variables. The evidence of an existing relationship between the variables through the plot of a scatter diagram as illustrated in figure 4.6 above became the basis upon which the study upheld as well as proceeded with the bivariate analysis.

Bivariate Data Analyses

The results of analyzed postulated hypotheses were presented with test conducted using Pearson's Product Moment Correlation Coefficient at 99% confidence level, which was accepted as a criterion for the probability for either accepting the null hypothesis at ($p > 0.01$) or rejecting the null hypothesis formulated at ($p < 0.01$). The strength of the correlation was interpreted according to the guideline provided by Dancey and Reidy (2007), where coefficients between 0.1–0.3 indicate a weak relationship, 0.4–0.6 indicate a moderate relationship, and 0.7–1.0 indicates a strong relationship."

Correlation Result of Teleworking and Employee Flexibility

H₀₁: There is no significant relationship between teleworking and employee flexibility of oil and gas firms in Bonny.

		Teleworking	Employee Flexibility
Teleworking	Pearson Correlation	1	.800**
	Sig. (2-tailed)		.000
	N	186	186
Employee Flexibility	Pearson Correlation	.800**	1
	Sig. (2-tailed)	.000	
	N	186	186

Source: SPSS Output, 2025

Correlation coefficient (r) = .800 (p < .01), Strength: Very Strong Positive Relationship.

There is a very strong and statistically significant positive relationship between teleworking and employee flexibility. This means that as teleworking opportunities increase, employee flexibility also increases substantially.

Correlation Result of Teleworking and Employee Speed

H₀₂: There is no significant relationship between teleworking and employee speed of oil and gas firms in Bonny.

		Teleworking	Employee Speed
Teleworking	Pearson Correlation	1	.880**
	Sig. (2-tailed)		.000
	N	186	186
Employee Speed	Pearson Correlation	.880**	1
	Sig. (2-tailed)	.000	
	N	186	186

Source: SPSS Output, 2025

Correlation coefficient (r) = .880 (p < .01), Strength: Very Strong Positive Relationship

A very strong positive relationship exists between teleworking and employee speed. Employees who engage in teleworking tend to complete their tasks faster and respond more promptly to work demands.

Correlation Result of Teleworking and Employee Adaptability

H₀₃: There is no significant relationship between teleworking and employee adaptability of oil and gas firms in Bonny.

		Teleworking	Employee Adaptability
Teleworking	Pearson Correlation	1	.862**
	Sig. (2-tailed)		.000
	N	186	186
Employee Adaptability	Pearson Correlation	.862**	1
	Sig. (2-tailed)	.000	
	N	186	186

Source: SPSS Output, 2025

Correlation coefficient (r) = .862 (p < .01), Strength: Very Strong Positive Relationship.

Teleworking strongly enhances employee adaptability.

Employees working remotely are highly capable of adjusting to new procedures, tools, and work environments.

Summary of Correlation Results

Hypothesis	Variables	r-value	Strength of Relationship	Interpretation
H01	Teleworking and Employee Flexibility	.800	Very Strong Positive	Teleworking significantly improves employee flexibility.
H02	Teleworking and Employee Speed	.880	Very Strong Positive	Teleworking leads to faster work completion among employees.
H03	Teleworking and Employee Adaptability	.862	Very Strong Positive	Teleworking enhances employees' ability to adapt to changes.

This report summarizes the findings of a study on the relationship between remote work and employee responsiveness in the oil and gas sector in Bonny, Rivers State, Nigeria. The research focused on how teleworking impacts three key measures of employee responsiveness: flexibility, speed, and adaptability.

Key Findings

The study found a strong and statistically significant positive relationship between teleworking and all three measures of employee responsiveness. The correlation coefficients were all above 0.70, indicating a very strong connection.

Teleworking and Flexibility: There was a significant positive relationship with a correlation coefficient (r) of 0.800. This suggests that teleworking empowers employees to manage their schedules and tasks more effectively, enhancing their overall flexibility. This finding is consistent with existing research that highlights teleworking's positive impact on work-life balance.

Teleworking and Speed: The study revealed a very strong positive relationship with a correlation coefficient (r) of 0.880. This indicates that remote work arrangements help employees complete tasks more quickly, likely due to fewer distractions and greater control over their work environment. This supports the idea that increased autonomy leads to faster task execution.

Teleworking and Adaptability: A strong positive relationship was found with a correlation coefficient (r) of 0.862. This suggests that teleworking enhances an employee's ability to adjust to new demands, processes, and technologies. This is in line with previous research

showing that remote work fosters independence and helps employees manage changes more effectively. All p -values were less than 0.01, confirming the statistical reliability of the results.

Conclusions

The study concludes that remote work, specifically teleworking, is a powerful tool for enhancing employee responsiveness in the oil and gas sector. By providing employees with greater control over their work conditions, it leads to significant improvements in their flexibility, speed, and adaptability. This makes remote work a strategic asset for fostering organizational agility, maintaining productivity, and ensuring competitiveness in an industry traditionally reliant on on-site operations.

Recommendations

Based on these findings, it is recommended that oil and gas companies in the region take the following actions: Formalize Policies: Develop and implement clear, comprehensive policies for teleworking. These should define eligibility, performance expectations, communication protocols, and accountability measures to ensure a smooth and productive transition.

Invest in Technology: Provide the necessary technological infrastructure to support remote work. This includes investing in reliable digital platforms, collaborative software, robust internet facilities, and strong cyber-security to maintain efficiency and productivity.

Boost Managerial Support: Train managers to effectively lead remote teams. This includes maintaining frequent communication, providing professional and emotional support, and recognizing the achievements of remote employees to foster motivation and a sense of belonging.

Abstract

Aim/Purpose

This perspective article explores how artificial intelligence (AI) can address the persistent barrier of geographical distance in African education, where rural learners travel long distances to under-resourced schools and urban learners face congestion and economic segregation. It argues that AI can transform distance from a structural disadvantage into an opportunity for equitable inclusion.

Background

Distance is a major determinant of access in Africa, intersecting with socioeconomic inequalities and infrastructural deficits. While AI-enabled learning tools are expanding globally, their role in mitigating Africa's distance-related inequities, especially in rural and peri-urban settings, remains underexplored.

Methodology

The article adopts a perspective approach, drawing on African case studies, policy insights, and emerging data to synthesize how AI interventions—adaptive tutoring, predictive analytics, and immersive classrooms—relate to equity.

Contribution

It positions AI not merely as a technological tool but as a culturally embedded strategy for social justice. The article introduces an Africanized framework combining opportunity cost, digital equity, and Ubuntu pedagogy to evaluate AI's potential to humanize learning.

Findings

Examples from Kenya, South Africa, and Uganda show that AI can reclaim time lost to travel, reduce fatigue, and expand access to resources. However, gaps in connectivity, affordability, and digital literacy risk reinforcing inequalities if adoption is not inclusive.

Recommendations for Practitioners

Educational policymakers and practitioners should design AI initiatives that are low-bandwidth, multilingual, and culturally relevant, ensuring accessibility for rural and peri-urban learners. Investments in infrastructure, digital literacy, and equity-focused policies are essential for sustainable adoption.

Recommendations for Researchers Impact on Society

Future research should emphasize Africa-specific longitudinal studies, localized AI design, and cross-disciplinary collaborations.
Harnessing AI to overcome distance can advance educational equity, reduce dropout

Future Research	rates, and foster inclusive human development across Africa. Further inquiry should address ethical safeguards, Ubuntu-informed pedagogy, and the scalability of inclusive AI solutions.
Keywords	Artificial intelligence in education, Africa, educational equity, distance and access, digital divide, humanized pedagogy.

Introduction

The challenge of distance in education remains particularly acute in Africa, where geographical and infrastructural barriers continue to shape access to learning opportunities (Gunter, 2025). Across many countries in sub-Saharan Africa, students in rural communities often walk several kilometres daily to reach schools, while urban learners face long commutes through congested and unreliable transport systems (Chilewa, 2019). UNESCO reports that nearly 34% of African children live more than 30 minutes away from a primary school, a proportion far higher than the global average, and in countries such as Nigeria, Tanzania, and Ethiopia, travel times frequently exceed one hour each way (Nwoke et al., 2024a). These spatial barriers intersect with structural inequalities: rural schools are more likely to be under-resourced, while urban schools remain stratified by economic segregation, perpetuating cycles of unequal opportunity (Nwoke et al., 2024b).

Artificial intelligence (AI) is increasingly presented as a transformative tool that can mediate these challenges by decoupling learning from geography (Rakuasa, 2023). AI-driven adaptive learning platforms, such as Eneza Education in Kenya, have reached

millions of learners in remote areas via simple mobile phones, offering personalized lessons that reduce dependence on physical proximity to schools (Oberdieck, 2021). Similarly, AI-powered early warning systems are being piloted in South Africa to identify at-risk students based on attendance and performance data, enabling timely interventions even when students face irregular school access due to distance (Embarak & Hawarna, 2024). These innovations illustrate how AI has the potential to reframe educational access: not merely as a matter of infrastructure and transport, but as a question of intelligent, equitable design (Ahmed, 2024).

Yet the promise of AI in Africa cannot be detached from the realities of the continent's digital divide (Kitsara, 2022). Internet penetration across Africa remains at approximately 36%, compared to a global average of 66%, and disparities in bandwidth, device ownership, and digital literacy risk reproducing the very inequalities AI is meant to solve (Anicet Kiemde & Dooguy Kora, 2020). While AI can mitigate the disadvantages of distance, poorly designed or narrowly implemented systems may reinforce exclusion by

privileging urban, affluent learners with better digital access (Li, 2023). Furthermore, questions of cultural relevance and decolonization in education demand that AI applications be adapted to local languages, pedagogical traditions, and community needs, rather than imported wholesale from global EdTech models (Nemorin, 2024).

This perspective article explores the relationship of geographical distance, educational equity, and AI in Africa. It argues that distance should not be understood only in physical terms but also in digital and cultural dimensions that shape learning access. By situating AI within Africa's diverse educational landscapes, the discussion highlights both its potential to humanize pedagogy and its risks of deepening inequity if deployed without sensitivity to local contexts. Through a synthesis of emerging African case studies, quantitative data, and theoretical insights, the article calls for policy frameworks and research agendas that critically evaluate AI's role in overcoming distance-related barriers and ensure its contributions align with the continent's broader goals of inclusive, equitable, and decolonized education.

Theoretical framework

Understanding the impact of distance on student academic performance in Africa requires a theoretical foundation that integrates geography, technology, and equity. In contexts where long commutes and infrastructural deficits continue to disadvantage learners, AI emerges as both a potential equalizer and a site of risk. Three interconnected theoretical lenses—educational access and opportunity cost, digital equity and the digital divide, and humanizing pedagogy within the Ubuntu tradition provide a framework for analysing how AI can transform distance-related challenges into opportunities for inclusion.

Educational Access and Opportunity Cost in African Schooling

Access to education in Africa has historically been shaped by spatial inequalities. Rural learners in countries such as Tanzania, Ethiopia, and Nigeria often face commutes of over an hour each way, with significant opportunity costs in terms of time for rest, study, and household responsibilities. Opportunity cost theory, traditionally applied to economic trade-offs, illuminates the stark choices faced by African families: long travel distances may force children to forego extracurricular learning, contribute to family labour, or

even drop out entirely. AI reframes this trade-off by offering adaptive learning resources through mobile devices, enabling students to reclaim learning time otherwise lost to distance. For instance, mobile-based AI tutoring platforms in East Africa allow learners to study after returning from farms or long journeys, converting distance into flexible digital opportunity.

Digital Equity and the African Digital Divide

While AI holds promise in extending access, its effectiveness is constrained by the continent's digital divide. Theories of digital equity emphasize that access is multidimensional, involving not only devices and connectivity but also digital literacy, affordability, and cultural relevance. Across Africa, disparities in broadband access and device ownership mean that AI-enhanced learning can deepen inequities if not accompanied by inclusive infrastructure development. The framework of digital justice—which links technology use to broader issues of fairness and equity—is especially salient in Africa. Without careful policy design, AI adoption may benefit urban elite schools while leaving rural communities further behind. Conversely, when embedded in inclusive strategies, such as the low-bandwidth AI-supported SMS systems in Kenya, AI can become a tool for democratizing access to quality learning regardless of geography.

Humanizing Pedagogy and the Ubuntu Philosophy

A uniquely African contribution to rethinking AI in education is found in the Ubuntu philosophy, which emphasizes relationality, community, and shared humanity: “I am because we are.” Applied to pedagogy, Ubuntu challenges technocentric models of AI by insisting on culturally relevant, community-centred approaches to learning. Humanizing pedagogy within this framework requires that AI applications not only deliver individualized content but also reflect local languages, cultural narratives, and collaborative modes of knowledge-building. For example, AI-assisted translation tools can support instruction in indigenous African languages, making distance learning more inclusive for learners in multilingual and rural contexts. By embedding Ubuntu into AI adoption, education can resist the risk of depersonalization and instead affirm collective values, ensuring that technology humanizes rather than alienates learning.

Toward a Contextualized AI Framework for Africa

By integrating opportunity cost theory, digital equity, and Ubuntu pedagogy, this framework highlights both the potential and the pitfalls of AI in addressing distance-related challenges in Africa. It underscores that the question is not merely whether AI can overcome geographical barriers, but how it can do so

without reproducing new forms of digital exclusion. A contextualized theoretical foundation recognizes that African learners experience distance in physical, economic, and digital forms simultaneously, and that AI must be harnessed to address all three dimensions. This holistic perspective provides a basis for analysing empirical findings and guiding future policy interventions to ensure that AI contributes meaningfully to educational equity and social justice in Africa.

Mechanisms Linking Distance to Academic Performance in Africa through AI

The impact of distance on student academic performance in Africa can be explained through several interrelated mechanisms encompassing, time allocation, physical and mental fatigue, and access to resources (Okpunukpang et al., 2024). These mechanisms highlight how geographical separation from schools continues to disadvantage African learners. However, AI introduces new opportunities to mitigate these barriers by extending access to personalized, context-sensitive learning (Rasheed et al., 2025).

Time Allocation and AI-Supported Flexibility

Long commutes significantly reduce the time students in Africa can dedicate to study and rest. Rural learners in northern Nigeria, for instance, often spend more than an hour traveling each way to reach school, while urban learners in cities like Lagos or Nairobi lose substantial hours in traffic congestion (Wachira et al., 2022). This lost time translates into fewer hours for homework, reading, and cognitive recovery. AI-enabled learning platforms, particularly those accessible through low-bandwidth mobile applications, provide flexibility for learners to engage in study outside rigid school hours (Alam & Mohanty, 2023). Eneza Education in Kenya and M-Shule in Uganda exemplify how AI-powered adaptive learning modules can deliver personalized exercises via SMS or lightweight apps, allowing learners to convert fragmented time at home or during travel into meaningful study opportunities (Yadav et al., 1 C.E.), (Kyambade et al., 2025). In this way, AI helps offset the opportunity costs imposed by distance (Uddin, 2024).

Physical and Mental Fatigue: AI as a Mediator of Cognitive Load

Physical fatigue from long walks and mental exhaustion from navigating poor transport systems remain defining features of African students' daily lives, especially in rural areas. Fatigue diminishes focus, memory retention, and classroom participation (Chen & Qin, 2024). AI applications can help mediate these effects by optimizing learning processes and

reducing cognitive overload (Twabu, 2025). Intelligent tutoring systems, for example, adjust the pace and complexity of material to match the learner's energy and attention levels, ensuring that students who arrive at school tired are not doubly disadvantaged (*Integrating Intelligent Tutoring Systems for Differentiated Learning in Inclusive Classrooms*, 2024). Furthermore, emerging AI-driven emotional recognition tools, though still in their infancy in Africa, can detect signs of disengagement or fatigue and prompt supportive interventions from teachers (Helwig, 2025). By integrating these adaptive systems, schools can better accommodate the realities of students who endure taxing commutes.

Access to Resources: Expanding Reach through AI-Powered Platforms

Distance often restricts African learners' access to libraries, laboratories, and extracurricular activities (Loots et al., 2023). In rural Malawi, for instance, schools lack adequate textbooks, while in many peri-urban South African contexts, participation in after-school clubs is curtailed by travel constraints (Altinyelken & Hoeksma, 2021). AI-driven digital platforms have begun to bridge these gaps. Virtual libraries powered by natural language processing tools can provide reading materials in local languages, while AI-based simulation software offers science experiments virtually, reducing reliance on physical labs (Murali et al., 2024). Moreover, AI-supported peer learning platforms allow collaboration across distances, enabling students in remote villages to join study groups with peers in urban centres (Tripathi et al., 2025). Such systems reconfigure access to resources from being place-bound to being digitally mediated, provided infrastructure gaps are addressed (Myronchuk et al., 2025).

Distance, AI, and Educational Equity in Africa

Taken together, these mechanisms demonstrate that while distance continues to create significant barriers to academic success in Africa, AI technologies can be harnessed to mitigate its effects (Ebelechukwu Okonkwo et al., 2024). Importantly, these interventions must be designed with inclusivity in mind: without careful attention to affordability, infrastructure, and cultural fit, AI could reinforce rather than resolve inequalities (Sarkar, 2025). A holistic approach requires not just the deployment of AI tools, but their integration into equitable policies and practices that recognize the lived realities of African learners (Pedro et al., 2019).

Geographical Variations and Contextual Factors in Africa

The impact of distance on student academic performance in Africa is highly differentiated across

urban, peri-urban, and rural settings (Lembani et al., 2020). Each geographical context presents unique challenges shaped by infrastructural, socioeconomic, and cultural factors. AI has the potential to mitigate these disparities, but its effectiveness depends on context-sensitive application and the narrowing of digital divides (Božić, 2023).

Urban Africa: Congestion, Inequality, and AI for Adaptive Access

In African megacities such as Lagos, Cairo, and Nairobi, physical proximity to schools does not necessarily translate into easy access (Mboup, 2019). Students frequently spend long hours navigating traffic congestion, unsafe transport routes, and economic segregation (Mboup, 2019). Urban schools are often better resourced, yet stark inequalities persist between affluent private institutions and underfunded public schools in informal settlements (*Education Policies, Systems, and Progress in Africa and Asia A Comparative Analysis of 12 Cities in Six Countries*, 2020). AI offers pathways to level this disparity through adaptive digital learning platforms. In South Africa, for instance, AI-powered early warning systems are being piloted to identify at-risk learners across diverse school districts, helping teachers intervene despite structural inequalities in school quality (Babu et al., 2024). Similarly, AI-enhanced timetabling and transport optimization systems can potentially reduce travel inefficiencies in dense cities, freeing more time for learning (Vetri Selvi et al., 1 C.E.).

Peri-Urban and Township Contexts: Infrastructure Gaps and AI Mediation

Peri-urban areas and townships, such as those surrounding Johannesburg or Accra, occupy an intermediate position where students may live closer to schools than rural learners but face significant infrastructural deficits, including irregular electricity, limited public transport, and uneven digital connectivity (Andoh, 2024). Many families rely on private vehicles or shared informal transport, which is unaffordable for low-income households. In these contexts, AI-mediated mobile platforms provide flexible alternatives. Low-bandwidth SMS-based AI tutoring systems, like M-Shule in Kenya, enable peri-urban learners to access personalized lessons without needing full-scale broadband or expensive devices (Jordan et al., 2025). These platforms transform learning into a more accessible, home-centred activity, thereby offsetting infrastructural gaps. AI chatbots and voice-based systems in local languages are also emerging, enabling learners with low literacy or limited internet to engage in educational support (Soledad et al., 2025).

Rural Africa: Distance, Underfunding, and AI's Expansive Potential

Rural Africa presents the most severe educational challenges associated with distance. In Ethiopia, Malawi, and northern Nigeria, learners often walk several kilometres to reach schools that are underfunded and face teacher shortages (Härmä, 2021). Roads are frequently poorly maintained, and public transport is absent. These conditions severely limit learning opportunities and contribute to dropout rates, especially among girls, who may also face safety risks during long commutes (Mchunu et al., 2025). AI-enabled distance learning platforms, when coupled with basic mobile infrastructure, offer transformative potential. In Kenya, Eneza Education has reached over six million rural learners through SMS-based AI tutoring, delivering subject-specific content without requiring smartphones or high-speed internet (Otieno et al., 2023). Similarly, pilot projects in Rwanda have explored AI-assisted radio and voice-based platforms to provide instruction in rural communities, ensuring access even where schools are sparsely distributed (Sangwa & Mutabazi, 2025). By leveraging widely accessible technologies such as feature phones, AI can reconfigure the geography of education, extending learning beyond the physical classroom (Quevedo Piratova et al., 2025).

Cultural and Infrastructural Factors: AI Between Opportunity and Risk

Cultural perceptions of education in Africa also shape how distance interacts with academic performance (Banda et al., 2023). In some rural communities, families prioritize agricultural or domestic labour over formal schooling, making long commutes an additional deterrent. Here, AI-enabled flexible learning systems provide an opportunity for students to study during non-school hours, balancing community responsibilities with learning (Singh et al., 1 C.E.). At the same time, infrastructure remains a critical constraint. Without affordable electricity, broadband connectivity, and reliable devices, AI risks reinforcing urban privilege while rural learners fall further behind (Sharma et al., 2024). Bridging this gap requires investments in infrastructure alongside AI deployment. Equally important is ensuring cultural relevance: AI systems must support African languages, local curricula, and context-specific pedagogies. Otherwise, AI risks importing homogenized learning models that alienate rather than empower African learners (Murungu, 2023).

Future Directions for Research in Africa

A deeper understanding of the relationship between distance and student academic performance in Africa requires moving beyond correlational insights toward

research that critically engages with AI as both a tool and a context-dependent intervention (Mfikoyi et al., 2025). The continent's unique educational geography, marked by rural-urban disparities, infrastructural deficits, and cultural diversity, offers an urgent yet fertile ground for reimagining how AI can transform access and equity in education (Adewale et al., 2024). Several future directions are particularly salient.

Longitudinal and Empirical Studies on AI in African Education

Most evidence on AI in education remains short-term and pilot-focused, leaving critical gaps in understanding its sustained impact on African learners facing distance-related barriers (Niane, 2024). Longitudinal research is needed to track how AI interventions such as SMS-based tutoring, predictive analytics for at-risk students, and AI-assisted radio programs affect learning trajectories over years rather than months (Hamid, 2024). For example, following rural learners in Ethiopia or Malawi who engage with AI-enabled platforms could reveal whether these tools offset the cumulative disadvantages of distance in the long run (Talema, n.d.). Such studies would also clarify whether AI narrows or inadvertently widens gaps between rural and urban learners.

Localized and Multilingual AI Design

AI tools must be adapted to Africa's cultural and linguistic diversity. With over 2,000 languages spoken across the continent, AI systems designed exclusively for English or French instruction risk excluding vast numbers of learners (Gwagwa et al., 2020). Future research should therefore explore the development and evaluation of AI platforms that support indigenous African languages and localized curricula (Senekal & Brokensha, 2023). Natural language processing (NLP) tailored to African dialects is an emerging field, but its integration into educational platforms remains limited. Investigating how such tools can humanize distance learning by making it culturally and linguistically inclusive is an urgent priority.

Cross-Disciplinary Collaboration: AI, Education, and African Realities

Addressing the complex intersections of distance, equity, and AI requires collaboration between educators, computer scientists, urban planners, and sociologists (Mac Fadden et al., 2024). For instance, urban planners and AI researchers can jointly use Geographic Information Systems (GIS) and machine learning to map "education deserts" in African cities, informing where AI-enabled digital hubs should be established (Macharia et al., 2023). Sociologists and educational psychologists can explore how AI-

mediated learning interacts with cultural values such as Ubuntu, which emphasizes community and collective well-being, ensuring that AI enhances rather than erodes social cohesion in African classrooms (Suliman et al., 2024).

Policy and Infrastructure: AI for Equity, Not Exclusion

AI in African education cannot succeed in isolation from infrastructural and policy reform (Kolog et al., 2022). Reliable electricity, affordable mobile internet, and device accessibility remain prerequisites for any AI intervention. Future research should therefore examine not just AI tools, but also the policy frameworks that determine their equitable deployment. For example, studies could analyse how national broadband policies in Kenya, Nigeria, or South Africa intersect with AI adoption in schools, and whether they reduce or reinforce inequalities in access (Adegoke et al., 2025). Equally, research into financing models, including public–private partnerships, community-based digital hubs, or open-source AI platforms can provide evidence-based pathways for sustainable AI integration in African education (Olusegun Aderibigbe et al., 2023).

Ethics, Equity, and the Risk of Digital Colonialism

Finally, critical research must interrogate the ethical dimensions of AI in African education (Gbadebo, 2024). Without careful design, AI platforms imported from global EdTech companies risk reproducing “digital colonialism,” where African learners are subjected to pedagogical models detached from their cultural realities (Salami, 2024). Future studies should therefore foreground equity, decolonization, and inclusivity in evaluating AI adoption. This includes examining how African-led AI innovation can resist dependency on foreign platforms and instead build context-sensitive systems that reflect the continent’s aspirations for self-determined educational development (Arakpogun et al., 2021).

Conclusion

The relationship between distance and academic performance in Africa underscores the profound impact of geography and infrastructure on educational opportunity. For decades, African learners, particularly those in rural and peri-urban areas have shouldered the burdens of long commutes, resource scarcity, and fatigue, all of which restrict academic engagement and widen equity gaps. This perspective has argued that AI offers a unique opportunity to transform these distance-related disadvantages into pathways for inclusion. AI-powered platforms such as adaptive tutoring systems, predictive analytics, and low-bandwidth mobile learning applications already demonstrate how

technology can reconfigure access by reaching students beyond the physical classroom. In Kenya and Uganda, SMS-based AI systems have allowed learners in remote communities to engage with curricula despite infrastructural limitations. In South Africa, AI-enhanced early warning systems are being deployed to identify at-risk learners irrespective of geographical location. These cases illustrate how AI can humanize access to education by reducing dependence on proximity and enabling learning opportunities that are flexible, personalized, and scalable.

Yet the promise of AI in Africa is inseparable from the continent’s structural realities. Without inclusive infrastructure policies, involving reliable electricity, affordable connectivity, and equitable device distribution, AI risks reinforcing existing inequalities, privileging urban elites while leaving rural learners further behind. Equally, without attention to cultural relevance and linguistic diversity, AI could impose external pedagogical models that alienate African learners rather than empowering them. This raises urgent questions about digital equity, decolonization, and the ethics of AI in education. For Africa, the challenge is therefore twofold: to harness AI as a powerful tool for bridging educational distance, and to ensure its deployment aligns with principles of social justice, Ubuntu, and cultural sustainability. Achieving this balance requires coordinated efforts among policymakers, educators, technologists, and communities to design AI systems that reflect African contexts and values. Future research must prioritize Africa-led innovations that address the continent’s unique challenges, while contributing critical insights to global debates on equity and AI in education. Ultimately, overcoming distance in African education is not solely a logistical or technological issue but a matter of justice and inclusion. AI can play a decisive role in creating an educational landscape where no learner’s potential is limited by where they live. By embedding AI within strategies that foreground equity, cultural relevance, and human dignity, Africa can chart a path toward an inclusive educational future—one that not only bridges the gap of distance but also redefines the meaning of access and opportunity in the age of AI.

Abstract

This study examined the effect of blockchain technology on the business performance of selected manufacturing firms in Delta State, Nigeria. The specific objectives were to evaluate the effect of blockchain transparency, traceability, security, and data integrity on business performance. A total of 150 questionnaires were distributed, out of which 140 were correctly completed and analyzed using descriptive statistics and multiple regression analysis with the aid of SPSS. Qualitative data were also obtained through interviews with management staff to provide deeper insights into blockchain adoption practices. The findings revealed that blockchain transparency, traceability, security, and data integrity each exert a positive and significant influence on business performance. Among these variables, blockchain security had the strongest effect, followed by data integrity, transparency, and traceability. The study further showed that blockchain implementation enhances operational efficiency, strengthens supply chain visibility, safeguards data, and improves organizational trust and accountability. The study concludes that blockchain technology significantly improves the business performance of manufacturing firms by promoting secure, transparent, and efficient operations. It recommends that firms should invest in blockchain infrastructure, build employee capacity, and integrate blockchain systems into supply chain operations while government and regulatory bodies should develop clear policies to encourage widespread adoption. The research contributes to knowledge by providing empirical evidence on the role of blockchain dimensions—transparency, traceability, security, and data integrity—in enhancing the performance of manufacturing firms within a developing economy context. The study also offers practical insights for managers and policymakers on leveraging blockchain for industrial competitiveness and sustainability.

Keywords: Blockchain Technology, Business Performance, Transparency, Traceability, Security, Data Integrity, Manufacturing Firms, Delta State, Nigeria.

Introduction

Blockchain technology has emerged as a transformative force across various industries, offering solutions that enhance transparency, traceability, security, and data integrity. In the manufacturing sector, these attributes are pivotal in optimizing operations and improving business performance. This study delves into the impact of blockchain technology, focusing on its facets of transparency, traceability, security, and data integrity, on the business performance of selected manufacturing firms in Delta State, Nigeria. The manufacturing industry is a cornerstone of economic development, contributing significantly to employment

and GDP. However, it faces challenges such as supply chain inefficiencies, counterfeit products, and data breaches, which can impede performance (Azzi, et al 2019). Blockchain technology, with its decentralized and immutable ledger system, offers potential solutions to these issues. By recording transactions across a distributed network, blockchain ensures that data is transparent, traceable, and secure, thereby enhancing operational efficiency and trust among stakeholders (Casino, et al 2019).

Transparency in manufacturing processes is crucial for building trust with consumers and partners. Blockchain's decentralized ledger records all

transactions in a manner that is accessible and verifiable by all authorized participants (Dai & Vasarhelyi, 2017). This level of openness can reduce information asymmetry and foster trust among supply chain partners. For instance, a study highlighted that by using a distributed ledger system, all transactions are recorded and can be accessed by anyone on the network, helping to reduce corruption, fraud, and other illegal activities (Dobrovnik, et al, 2018).

Traceability is another critical aspect where blockchain can make a significant impact. In complex supply chains, tracking the origin and movement of products can be challenging, leading to issues like counterfeiting and quality control problems (Francisco & Swanson, 2018). Blockchain provides a tamper-proof record of a product's journey from its origin to the consumer, thereby enhancing traceability. This capability is particularly beneficial in industries where product authenticity and quality are paramount. For example, blockchain allows for real-time tracking of goods, ensuring transparency and accountability at each stage of the supply chain (Hackius & Petersen, 2017).

Security in data management is a pressing concern for manufacturing firms, especially with the increasing digitization of operations. Blockchain's immutable ledger ensures that once data is recorded, it cannot be altered or deleted without consensus from the network, thereby safeguarding data integrity (Kshetri, 2018). This feature protects sensitive information from unauthorized access and tampering, which is crucial for maintaining the confidentiality and integrity of manufacturing processes. Integrating AI and blockchain into quality management systems transforms how organizations ensure data integrity and automate processes (Kouhizadeh, et al, 2021).

Data integrity is fundamental to decision-making and operational efficiency in manufacturing. Blockchain ensures that data remains accurate, consistent, and reliable throughout its lifecycle. This reliability enables firms to make informed decisions, optimize processes, and maintain compliance with industry standards. A study emphasized that blockchain technology has the potential to improve the efficiency of numerous areas of the financial industry, which can be extrapolated to manufacturing sectors where data integrity is critical (Li, et al, 2021). The adoption of blockchain technology in manufacturing is not without challenges. Issues such as the need for substantial investment in infrastructure, the requirement for technical expertise, and concerns about data privacy and regulatory compliance can hinder implementation. However, the potential benefits, including enhanced transparency, improved traceability, strengthened security, and assured data integrity, make a compelling case for its integration into manufacturing processes.

In the context of Delta State, Nigeria, manufacturing firms operate in a dynamic environment with unique challenges. The integration of blockchain technology could address specific issues such as supply chain inefficiencies, product counterfeiting, and data management challenges. By enhancing transparency and traceability, firms can build trust with consumers and partners, leading to improved market competitiveness. Strengthened security and data integrity can protect against data breaches and ensure compliance with industry regulations, thereby enhancing overall business performance. Empirical studies have begun to explore the impact of blockchain technology on manufacturing firms in Nigeria. For instance, a study of Chukwu, et al (2024), investigated materials management and the adoption of blockchain technology on supply chain efficiency in Nigerian Breweries Plc Ama, Enugu. The findings suggest that the application of blockchain technology improves supply chain efficiency, which can be a driver of profitability in manufacturing firms.

Furthermore, blockchain's role in enhancing supply chain transparency and traceability has been recognized as a key factor in reducing administrative costs and improving operational efficiency. By providing a verifiable record of a product's origin, blockchain helps prevent the circulation of counterfeit goods and ensures that all participants in the supply chain have access to the same information, thereby reducing discrepancies and disputes (Manupati, et al, 2022). The potential of blockchain technology to revolutionize manufacturing processes extends beyond supply chain management. It can also play a significant role in areas such as quality control, contract management, and data sharing (Mao, et al, 2018). For example, in quality control, blockchain can establish tamper-proof records, boosting consumer confidence in the products. In contract management, smart contracts can automate execution, enhancing efficiency and reducing the need for intermediaries. Blockchain also fosters secure collaboration in manufacturing, which is crucial for system stability and safety (Nandi & Dey, 2021).

Despite the promising benefits, the adoption of blockchain technology in manufacturing firms in Delta State, Nigeria, remains in its nascent stages. Factors such as limited awareness, lack of technical expertise, and infrastructural challenges impede widespread implementation. However, as global trends move towards increased digitization and the demand for transparency and accountability in business operations grows, the impetus for adopting blockchain technology becomes stronger. Thus, blockchain technology holds significant potential to enhance the business performance of manufacturing firms by improving transparency, traceability, security, and data integrity. While challenges to adoption exist, the benefits offer a

compelling case for integration into manufacturing processes. As firms in Delta State, Nigeria, navigate the complexities of the modern manufacturing landscape, embracing blockchain technology could serve as a catalyst for improved operational efficiency and competitiveness.

The Problem

The manufacturing sector in Nigeria is pivotal to the nation's economic development but faces significant challenges, including supply chain inefficiencies, counterfeit products, and data breaches, which hinder operational performance and profitability (Queiroz & Wamba, 2020). Blockchain technology, with its decentralized and immutable ledger system, offers potential solutions by enhancing transparency, traceability, security, and data integrity (Tönnissen & Teuteberg, 2020). However, despite its transformative potential, blockchain adoption in Nigeria's manufacturing industry is still in its early stages, and empirical studies examining its impact remain limited (Hastig & Sodhi, 2020). While blockchain's potential benefits are widely discussed, there is a scarcity of empirical studies focusing on its application within Nigeria's manufacturing sector. Existing research primarily addresses theoretical aspects, leaving a gap in practical, data-driven insights (Durach et al., 2020). Nigeria presents unique challenges such as infrastructure deficits, regulatory hurdles, and market dynamics that may affect blockchain implementation differently compared to other regions. Current literature does not adequately address these context-specific factors (Queiroz & Wamba, 2020). Although blockchain is touted to improve supply chain efficiency, there is limited evidence demonstrating how it influences key performance indicators within Nigerian manufacturing firms. Understanding this impact is crucial for informed decision-making (Tönnissen & Teuteberg, 2020). Factors hindering the adoption of blockchain technology in Nigeria's manufacturing sector, such as high implementation costs, lack of technical expertise, and resistance to change, are not thoroughly explored in recent studies (Hastig & Sodhi, 2020). Addressing these gaps will provide valuable insights into the practical implications of blockchain technology in enhancing the performance and competitiveness of manufacturing firms in Nigeria. This study aims to fill this gap by investigating the effects of blockchain technology proxied with Blockchain Transparency (BTC), Blockchain Traceability (BTB), Blockchain Security (BS) and Blockchain Data Integrity (BDI) on business performance (BP) of selected manufacturing firms in Delta State, Nigeria.

Research Questions

How does blockchain transparency affect the business performance of selected manufacturing firms in Delta State?

- What is the effect of blockchain traceability on business performance of selected manufacturing firms in Delta State?
- To what extent does blockchain security contribute to business performance of selected manufacturing firms in Delta State?
- How does blockchain-enhanced data integrity influence business performance of selected manufacturing firms in Delta State?

Objectives of the Study

The main objective of this study is to examine the effect of blockchain technology on the business performance of selected manufacturing firms in Delta State, Nigeria. The specific objectives are:

- to evaluate the effect of blockchain transparency on business performance of selected manufacturing firms in Delta State.
- to determine the influence of blockchain traceability on business performance of selected manufacturing firms in Delta State.
- to assess the effect of blockchain security on business performance of selected manufacturing firms in Delta State.
- to investigate how blockchain-enhanced data integrity affects business performance of selected manufacturing firms in Delta State.

Research Hypotheses

H₀₁: Blockchain transparency has no significant effect on business performance of selected manufacturing firms in Delta State.

H₀₂: Blockchain traceability does not significantly effect business performance of selected manufacturing firms in Delta State.

H₀₃: Blockchain security has no significant influence on business performance of selected manufacturing firms in Delta State.

H₀₄: Blockchain-enhanced data integrity does not significantly affect business performance of selected manufacturing firms in Delta State.

Review of Related Literature

Conceptual Review

Blockchain Technology

Blockchain technology is a decentralized and distributed ledger system that allows secure and transparent recording of transactions across multiple nodes in a network. Introduced in 2008 as the foundation of Bitcoin (Nakamoto, 2008), it has evolved to become a tool with transformative potential in

various sectors, including finance, healthcare, logistics, and manufacturing. The primary characteristic of blockchain is its ability to ensure data immutability, which means once data is recorded, it cannot be altered without consensus from the network (Zohar et al., 2021). This feature is particularly advantageous in sectors where transparency and security are paramount. Recent studies have underscored blockchain's capacity to streamline processes and reduce operational costs. For example, according to a report by Tapscott and Tapscott (2020), blockchain's decentralized nature enhances trust between parties, making it a powerful tool in industries that involve complex supply chains and numerous stakeholders. Additionally, blockchain's integration with technologies like the Internet of Things (IoT) and Artificial Intelligence (AI) has further amplified its potential in optimizing manufacturing and logistics operations (Garg & Yadav, 2021).

Blockchain Transparency (BTC)

Blockchain transparency refers to the openness and accessibility of data stored within the blockchain system. It allows all authorized users to view and verify transaction records, promoting accountability and reducing opportunities for fraud. In the context of manufacturing, transparency is essential for enhancing operational visibility and fostering trust between business partners (Seitz et al., 2021). A study by Chen et al. (2021) demonstrated that blockchain transparency significantly reduced inefficiencies in the supply chain by enabling real-time monitoring of product movement and transaction status. Transparency through blockchain ensures that all parties involved in the manufacturing process—from suppliers to consumers—have access to the same verifiable data, minimizing the potential for conflicts or discrepancies. The application of blockchain transparency in manufacturing can lead to better decision-making, as stakeholders can make informed choices based on the immutable and transparent nature of the data.

Blockchain Traceability (BTB)

Traceability refers to the ability to track the history and movement of a product throughout its entire lifecycle, from raw material sourcing to final consumption. In manufacturing, traceability is critical for maintaining quality control, preventing counterfeit goods, and ensuring compliance with regulatory standards (Li et al., 2021). Blockchain enhances traceability by creating a tamper-proof record of every transaction or change in the supply chain, ensuring that product origins and movements are well-documented. According to Wang et al. (2022), the traceability feature of blockchain technology provides manufacturers with a clear and auditable history of a product's journey, significantly reducing the occurrence of counterfeit goods and

enhancing the credibility of products. This feature also allows for quick identification and resolution of quality issues, making it easier to recall defective products, if necessary. In Nigeria, where issues like counterfeit products in manufacturing are rampant, blockchain traceability presents an effective solution for ensuring product authenticity and safety (Adeyemo et al., 2021).

Blockchain Security (BS)

Security is one of the fundamental attributes of blockchain technology. Blockchain uses advanced cryptographic techniques to ensure the integrity and confidentiality of data. Unlike traditional databases, where data can be altered or deleted by authorized parties, blockchain's immutability feature prevents unauthorized changes once data is recorded, making it highly secure (Crosby et al., 2020). In the manufacturing sector, security concerns related to data breaches, cyberattacks, and unauthorized access to sensitive information are prevalent (Shetty & Singh, 2021). Blockchain's security features are vital in mitigating these risks by ensuring that data is securely stored and accessible only by authorized users. This aspect of blockchain can also protect intellectual property, trade secrets, and sensitive customer information, which are valuable assets in manufacturing firms (Chang et al., 2021). A study by Alzahrani et al. (2020) revealed that the implementation of blockchain in supply chain management enhanced the security of transactions, particularly in industries dealing with sensitive or high-value products, such as pharmaceuticals and electronics. In Nigeria, where cybercrime poses a significant challenge to businesses, the adoption of blockchain security can bolster trust and protect critical business assets.

Blockchain Data Integrity (BDI)

Data integrity is the assurance that data remains accurate, consistent, and trustworthy over its lifecycle. Blockchain ensures data integrity through its immutable ledger, where once data is recorded, it cannot be tampered with without altering every subsequent block, which would require the consensus of the network (Böhme et al., 2020). This capability is particularly valuable in manufacturing, where accurate data is essential for maintaining quality, ensuring compliance, and making informed decisions. Research by Park and Kim (2021) highlighted that blockchain enhances data integrity by eliminating errors associated with manual data entry and mitigating risks related to data manipulation. In manufacturing environments, where data is constantly generated across various stages of production, blockchain technology ensures that information related to inventory, production schedules, and supply chain status remains reliable.

This also aids in maintaining compliance with industry regulations, such as product safety standards.

Business Performance (BP)

Business performance in the manufacturing sector is a measure of a firm's operational efficiency, profitability, and ability to meet market demands. Blockchain technology can significantly impact business performance by optimizing processes, enhancing transparency, and improving supply chain management. According to a study by Sharma et al. (2021), the adoption of blockchain led to reduced operational costs, improved product quality, and greater customer satisfaction. In the context of Nigeria's manufacturing sector, where inefficiencies and fraud often hinder business performance, blockchain presents a solution to optimize operations. Adeyemo et al. (2021) noted that blockchain integration improved decision-making by providing reliable and real-time data, which is crucial for manufacturing firms operating in dynamic and competitive markets. Furthermore, the increased transparency and traceability enabled by blockchain enhance relationships with suppliers and customers, improving trust and market competitiveness.

Blockchain Technology on Business Performance in Manufacturing in Nigeria

In Nigeria, the manufacturing industry faces numerous challenges; including supply chain inefficiencies, counterfeit goods, and security risks. The adoption of blockchain technology has the potential to address these issues and enhance business performance in the sector. A study by Okoli and Nwachukwu (2021) suggested that blockchain technology could enhance supply chain transparency, reduce operational costs, and improve product quality in Nigerian manufacturing firms. Blockchain's ability to provide real-time, verifiable data on product movements and transaction histories can foster trust among stakeholders and lead to more efficient operations (Afolabi & Nwachukwu, 2021). In addition, blockchain's ability to prevent fraud and ensure data integrity is particularly important in Nigeria, where counterfeiting and data breaches are major concerns (Alabi et al., 2021). As such, blockchain adoption can help Nigerian manufacturers improve operational efficiency, enhance product quality, and strengthen relationships with customers and suppliers, ultimately improving their business performance.

Theoretical Review

Distributed Ledger Theory (DLT)

Distributed Ledger Theory (DLT) is a foundational concept that describes a decentralized database that is maintained and shared across multiple nodes within a

network. The origin of DLT can be traced back to the early developments of cryptographic systems, particularly the introduction of blockchain in the context of Bitcoin by Satoshi Nakamoto in 2008. Nakamoto's work demonstrated that a decentralized ledger could be used to ensure secure transactions without the need for intermediaries like banks (Nakamoto, 2008). This theory has evolved from a pure cryptocurrency application into a broader technology used in various industries to ensure data integrity, transparency, and security.

DLT supports blockchain transparency (BTC) by enabling an immutable record of transactions that are visible and accessible to all participants in the network. Through this feature, blockchain ensures that manufacturing firms' operations are more transparent, providing real-time information to all stakeholders. For instance, in Delta State, Nigeria, the use of blockchain-based DLT can ensure that every transaction, such as raw material procurement or product distribution, is recorded in an open ledger. This reduces the opportunity for fraudulent activities and enhances trust among manufacturers, suppliers, and customers (Seitz et al., 2021). Furthermore, DLT supports traceability (BTB) by providing an auditable trail of all product transactions, allowing firms to track the origin of raw materials, product movement, and quality at every stage. This visibility contributes to greater operational efficiency and better business performance (Wang et al., 2022). In relation to business performance (BP), DLT's ability to create a secure, transparent, and immutable ledger allows manufacturing firms in Delta State to improve operational processes, reduce supply chain inefficiencies, and increase stakeholder confidence. By enhancing transparency and traceability, DLT facilitates smoother transactions and decision-making, which ultimately drives better business outcomes.

Game Theory (Incentive Mechanisms)

Game Theory, introduced by mathematician John von Neumann and economist Oskar Morgenstern in 1944, is a theoretical framework used to understand the strategic interactions between rational decision-makers. The application of Game Theory to blockchain technology is particularly relevant in the context of incentive mechanisms. These mechanisms ensure that participants in a blockchain network act in ways that maintain the integrity of the system. In blockchain, miners or validators are incentivized through mechanisms such as proof-of-work (PoW) or proof-of-stake (PoS) to validate and secure transactions, ensuring that the network remains decentralized and functional.

Incentive mechanisms play a critical role in Blockchain Security (BS). By applying Game Theory principles, blockchain systems incentivize honest behavior and

disincentivize malicious activities such as fraud or double-spending. In manufacturing firms, this aspect of blockchain can help safeguard sensitive data and transactions, ensuring that security breaches are minimized and that the integrity of supply chain data is maintained (Alzahrani et al., 2020). Moreover, the incentive structure of blockchain encourages participants to follow the rules of the network, thus ensuring the security and privacy of sensitive business data, which is critical for manufacturing firms dealing with proprietary information. Game Theory's influence extends to Blockchain Data Integrity (BDI), as the incentives embedded within blockchain protocols ensure that participants are motivated to maintain accurate and reliable data. When applied to the manufacturing sector in Delta State, Nigeria, this feature of blockchain allows for accurate record-keeping, ensuring that manufacturers make informed decisions based on trustworthy data. For instance, through the use of smart contracts, blockchain can automate various manufacturing processes, reducing human error and improving data integrity in the supply chain.

Thus, Game Theory and its incentive mechanisms help to improve business performance (BP) by reducing costs related to fraud, improving security, and ensuring that the data used for decision-making is accurate and reliable. By promoting secure and efficient systems for managing transactions and data, blockchain technology enhances the overall performance of manufacturing firms in Delta State, Nigeria.

Cryptographic Theory

Cryptographic Theory has been pivotal in the development of blockchain technology. Cryptography, as a field of study, deals with securing communication and information through the use of mathematical algorithms. The application of cryptographic techniques to blockchain technology ensures that data is encrypted and secured, preventing unauthorized access, tampering, or fraud. The concept of using cryptography to ensure the security and privacy of transactions was popularized by the introduction of Bitcoin (Nakamoto, 2008), which relied on cryptographic hash functions and public-private key pairs for secure transactions.

Cryptography underpins Blockchain Security (BS) by providing the foundation for secure transactions and safeguarding sensitive data in manufacturing operations. Through the use of hashing, digital signatures, and encryption, blockchain technology ensures that data cannot be altered or tampered with, thereby preserving the security and confidentiality of business operations. For example, in the context of manufacturing in Delta State, cryptographic techniques in blockchain can protect intellectual property,

contracts, and sensitive operational data from unauthorized access or cyberattacks (Shetty & Singh, 2021).

Cryptographic theory also contributes to Blockchain Transparency (BTC) by ensuring that all transactions are verifiable and traceable. While the data is transparent to authorized users, cryptographic encryption ensures that the participants' identities and sensitive information remain protected. This balance between transparency and privacy allows manufacturing firms to operate in an open yet secure environment, where stakeholders can access relevant data without compromising business confidentiality (Chang et al., 2021).

Furthermore, cryptographic techniques are critical to Blockchain Data Integrity (BDI), as they guarantee the authenticity and consistency of the data stored on the blockchain. Since each block is linked through cryptographic hashes, any alteration to the data would require the modification of all subsequent blocks, making tampering virtually impossible. For manufacturing firms in Delta State, Nigeria, this ensures that product quality and supply chain data remain accurate and reliable, which is essential for decision-making and regulatory compliance.

In relation to business performance (BP), the application of cryptography in blockchain technology enhances operational efficiency, reduces security risks, and fosters trust among stakeholders, all of which contribute to improved business outcomes. As manufacturing firms in Delta State face challenges such as data breaches and counterfeit products, cryptographic security offers a robust solution to mitigate these risks and improve overall performance.

Empirical Review

Wang, Zhao, and Jiang (2022) explored the potential of blockchain to improve transparency and traceability in supply chains, focusing on the manufacturing sector. The study employed a survey methodology, collecting data from 150 firms in China. The data were analyzed using structural equation modeling (SEM) to assess the effect of blockchain's transparency and traceability on supply chain performance. Findings revealed that blockchain's transparency significantly improved supply chain visibility, while traceability reduced the occurrence of counterfeit products. The study concluded that blockchain enhances business performance by increasing operational transparency and reducing risks associated with counterfeit goods. The authors recommended that firms integrate blockchain to optimize supply chain operations and improve performance.

Chang, Liu, and Yang (2021) examined the role of blockchain technology in enhancing operational performance, focusing on transparency, traceability,

and data integrity in the manufacturing sector. The study adopted a mixed-methods approach, combining qualitative interviews with industry experts and quantitative surveys from 150 manufacturing firms in China. Data analysis was conducted using multiple regression to assess the relationship between blockchain technology and business performance. The results revealed that blockchain's security and data integrity features significantly improved manufacturing performance by reducing fraud and ensuring accurate and reliable data. The study concluded that blockchain adoption can enhance the overall operational efficiency of firms, and recommended that manufacturers consider integrating blockchain into their business processes to improve security and traceability.

Li, Guo, and Liu (2021) focused on the impact of blockchain on supply chain efficiency and performance, specifically examining blockchain's transparency (BTC), traceability (BTB), and data integrity (BDI) in the automotive industry. The researchers used a quantitative survey methodology, collecting data from 120 firms in Europe. Structural equation modeling (SEM) was used to analyze the data. The study found that blockchain's transparency and traceability significantly enhanced supply chain performance by providing real-time access to product information and ensuring the authenticity of products. Data integrity also played a crucial role in improving operational efficiency and reducing costs. The authors concluded that blockchain is a powerful tool for improving business performance in the automotive sector and recommended its adoption across manufacturing supply chains.

Shetty and Singh (2021) examined the role of blockchain technology in enhancing the security and data integrity of manufacturing firms. The study employed a survey methodology, collecting data from 100 manufacturing firms in India. Regression analysis was used to analyze the relationship between blockchain features, such as security (BS) and data integrity (BDI), and business performance (BP). The results indicated that blockchain's security features significantly enhanced data protection, reducing the risks of data breaches and improving the trustworthiness of operations. The study concluded that blockchain technology improves business performance by strengthening data security and integrity. The authors recommended that manufacturing firms adopt blockchain to safeguard sensitive data and enhance operational efficiency.

Literature Gaps

The growing application of blockchain technology in the manufacturing sector has garnered significant attention due to its potential to enhance transparency, traceability, security, and data integrity. Numerous

studies have examined the role of blockchain in improving business performance, particularly in supply chain operations. While empirical studies provide insights into blockchain's impact on manufacturing efficiency, several gaps remain in the existing literature that warrant further investigation. These gaps are particularly evident in findings, variables, methodology, and geographical focus, especially in the context of Nigeria, where blockchain adoption is still at an early stage. This research aims to address these gaps by focusing on the effect of blockchain technology, proxied by blockchain transparency (BTC), traceability (BTB), security (BS), and data integrity (BDI), on the business performance (BP) of selected manufacturing firms in Nigeria.

Findings Gaps: Although several studies highlight the positive influence of blockchain's transparency, traceability, and security on supply chain performance and business outcomes (e.g., Alzahrani et al., 2020; Chang et al., 2021; Jain et al., 2021), there remains a lack of consensus on the specific mechanisms through which these blockchain attributes influence business performance. For instance, while Alzahrani et al. (2020) found that transparency and traceability improve operational efficiency, the specific aspects of business performance—such as profitability, customer satisfaction, and market share—were not fully explored in the context of the Nigerian manufacturing sector. Additionally, the role of data integrity in strengthening decision-making and business operations, as discussed by Feng et al. (2021) and Jain et al. (2021), has not been systematically examined in the Nigerian manufacturing context. These gaps highlight the need for more targeted studies that examine the causal relationships between blockchain attributes and various dimensions of business performance.

Variables Gaps: While many studies have focused on key blockchain attributes like transparency, traceability, security, and data integrity (e.g., Li et al., 2021; Wang et al., 2022), few studies have analyzed how these variables interact with each other and influence different aspects of business performance. For example, Li et al. (2021) concentrated on traceability and transparency but did not fully integrate the interaction between security and data integrity in their model, which are crucial to understanding blockchain's full impact on business operations. Similarly, Alzahrani et al. (2020) highlighted the impact of transparency and traceability on supply chain efficiency, but they did not explore how these variables, in conjunction with security, influence organizational performance outcomes such as profitability, growth, or sustainability. The integration of these blockchain features into a

comprehensive model remains a critical gap in the literature.

Methodological Gaps: The studies reviewed primarily employed quantitative methods, such as structural equation modeling (SEM) and regression analysis, to assess the impact of blockchain technology on business performance (e.g., Chang et al., 2021; Jain et al., 2021; Alzahrani et al., 2020). While these approaches provide valuable insights, they often lack a deeper qualitative understanding of how blockchain is implemented and the challenges firms face in adopting this technology. For example, Shetty and Singh (2021) used regression analysis to demonstrate the impact of security and data integrity on performance, but did not explore the managerial, organizational, or technological challenges encountered by manufacturing firms. Furthermore, the studies generally lacked longitudinal data that could provide insights into the long-term effects of blockchain adoption on performance metrics. More mixed-methods or longitudinal research is needed to explore the implementation challenges, processes, and sustained benefits of blockchain technology in manufacturing firms.

Geographical Gaps: Although the studies reviewed provide insights from various global contexts, there is a notable geographical gap, particularly in the African region. Many of the empirical studies are based on data from countries like China, India, and Saudi Arabia (e.g., Chang et al., 2021; Li et al., 2021; Jain et al., 2021), with limited attention paid to sub-Saharan Africa, specifically Nigeria. While Akinyele et al. (2021) examined blockchain in the Nigerian manufacturing context, their study was limited in scope and did not fully explore the regional challenges, such as infrastructure limitations, regulatory frameworks, and market conditions that influence blockchain adoption. The majority of studies, including those from Pakistan and India (Khan et al., 2021; Sundararajan et al., 2021), focus on well-established or emerging markets where blockchain adoption is relatively advanced. The Nigerian manufacturing sector, however, faces unique challenges, such as infrastructural gaps, which may significantly influence the effectiveness of blockchain technology in improving business performance. Therefore, there is a need for more focused studies that investigate how blockchain can be successfully integrated into Nigerian manufacturing firms to improve their performance.

Tools and Methods

Research Design

This study adopted a descriptive survey research design. The population of this study consisted of employees from five selected manufacturing firms in Delta State,

Nigeria, who were involved in operations that could be impacted by blockchain technology. These employees included supply chain managers, IT personnel, and senior executives within Nigerian Breweries Plc, West African Plastics Ltd, Delta Steel Company Ltd, Dufil Prima Foods Plc, and Excel Paints Manufacturing Ltd. These individuals were considered ideal as they were in positions to provide insights on how blockchain attributes such as transparency, traceability, security, and data integrity influenced business performance within their respective firms. The total population was estimated to be approximately 150 employees across the five firms, based on internal records. This number was adopted because of the size as permissible in sreserach when the sample is small(xxxx). This study employed a stratified random sampling technique. The stratification was based on job roles within the selected manufacturing firms, including supply chain managers, IT personnel, and senior executives. Primary data were collected using a structured questionnaire. The questionnaire was distributed to respondents in the selected manufacturing firms. It was designed with a Likert-scale format, with respondents asked to rate their agreement with statements related to blockchain transparency, traceability, security, data integrity, and business performance. The Likert scale ranged from “Strongly Disagree” (1) to “Strongly Agree” (5). This method enabled the systematic collection of data that was easy to analyze quantitatively. The research instrument for this study was a structured questionnaire, which was divided into sections. The first section collected demographic information about the respondents, such as their job role and years of experience. The second section focused on the independent variables (blockchain transparency, traceability, security, and data integrity), while the third section addressed business performance, the dependent variable. Each section contained questions designed to capture respondents' perceptions and experiences with blockchain technology in their respective firms. The reliability of the research instrument was tested using Cronbach's alpha coefficient. A pilot study was conducted with a small group of respondents from similar manufacturing firms not included in the main study. The Cronbach's alpha values for each of the variables were calculated as follows:

Blockchain Transparency (BTC): $\alpha=0.82$

Blockchain Traceability (BTB): $\alpha=0.79$

Blockchain Security (BS): $\alpha=0.85$

Blockchain Data Integrity (BDI): $\alpha=0.88$

Business Performance (BP): $\alpha=0.81$

These values indicated that the instrument had acceptable internal consistency, with all variables having a Cronbach's alpha value of 0.7 or above. Based on the results of the pilot study, minor revisions were made to the instrument to further enhance its reliability.

The data collected from the questionnaires were analyzed using quantitative techniques. Descriptive statistics, such as frequencies, means, and standard deviations, were used to summarize and describe the characteristics of the data. Multiple regression analysis was employed to examine the relationships between the independent variables (blockchain transparency, traceability, security, and data integrity) and the dependent variable (business performance). This statistical technique was appropriate because it allowed for the assessment of the simultaneous effects of multiple independent variables on a single dependent variable. The regression analysis helped determine the extent to which each of the blockchain attributes affected business performance and identified which variable had the most significant impact. The study was guided by a model ($BP = \beta_0 + \beta_1 BTC + \beta_2 BTB + \beta_3 BS + \beta_4 DI + \epsilon$) reflecting BP = Business Performance (dependent variable), BTC = Blockchain Transparency (Independent variable), BTB = Blockchain Traceability (Independent variable), BS = Blockchain Security

Variable	N	Mean	Std. Deviation	Interpretation
Blockchain Transparency	140	4.21	0.63	High
Blockchain Traceability	140	4.08	0.71	High
Blockchain Security	140	4.35	0.58	Very High
Data Integrity	140	4.27	0.65	High
Business Performance	140	4.18	0.69	High

The descriptive results suggest that respondents strongly agreed that blockchain technology enhances transparency, traceability, data integrity, and overall operational security, which in turn improves performance indicators such as productivity, quality control, and customer trust.

Regression Analysis

A multiple regression analysis was conducted to examine the effect of the four blockchain constructs (transparency, traceability, security, and data integrity) on business performance.

Coefficients Table:

Predictor Variable	Beta (β)	t-value	Sig. (p)	Interpretation
Blockchain Transparency	0.254	4.672	0.000	Significant
Blockchain Traceability	0.198	3.861	0.001	Significant
Blockchain Security	0.301	5.497	0.000	Significant
Data Integrity	0.276	4.208	0.000	Significant

Interpretation of Findings

The regression results reveal that blockchain security ($\beta = 0.301$) exerts the strongest positive effect on business performance, followed by data integrity ($\beta = 0.276$) and transparency ($\beta = 0.254$). Traceability also contributes significantly ($\beta = 0.198$), though slightly lower than the others. This implies that blockchain

(Independent variable), BDI = Blockchain Data Integrity (Independent variable), β_0 = Intercept, β_1 - β_4 = Coefficients for each independent variables and ϵ = Error term

Analysis, Results and Discussion

Data Presentation and Response Rate

Out of the 150 questionnaires administered to selected manufacturing firms in Delta State, 140 were properly completed and returned, representing a 93.3% response rate. This high response rate was considered adequate for robust statistical analysis. The respondents comprised top and middle management staff from production, finance, ICT, and operations departments, ensuring diverse insights on blockchain adoption and business performance.

Descriptive Statistics

Descriptive analysis using SPSS showed that most firms had integrated blockchain applications mainly in supply chain management, quality assurance, and data recording.

Model Summary:

$R = 0.872$

$R^2 = 0.761$

Adjusted $R^2 = 0.749$

$F(4,135) = 107.23, p < 0.001$

This indicates that 76.1% of the variation in business performance is explained by the combined influence of blockchain transparency, traceability, security, and data integrity.

adoption enhances secure transactions, reduces data tampering, improves traceability, and promotes trust-based performance in manufacturing operations.

Qualitative Insights

Interviews with 10 managers revealed that blockchain technology has improved accountability, streamlined record-keeping, and reduced losses from counterfeit

products. One production manager noted that *“blockchain-based traceability has significantly improved customer confidence and reduced product recalls.”* Another ICT officer emphasized that *“enhanced data integrity has minimized audit discrepancies and increased operational transparency across departments.”*

The qualitative data corroborate the quantitative findings by highlighting that blockchain systems foster reliability, transparency, and inter-departmental efficiency, thereby reinforcing competitive advantage and business sustainability.

Discussion of Findings

The findings align with earlier empirical studies (e.g., Kamble et al., 2021; Saberi et al., 2019) which established that blockchain transparency and traceability enhance supply chain visibility and operational efficiency. Similarly, the strong positive impact of blockchain security on business performance supports Tijan et al. (2020), who emphasized that blockchain’s immutable nature reduces fraud and ensures data protection.

In the Delta State context, these results suggest that manufacturing firms leveraging blockchain experience improved performance outcomes—particularly in customer trust, process efficiency, and compliance management. However, challenges such as limited technical expertise, infrastructural constraints, and regulatory ambiguity still pose barriers to widespread blockchain adoption.

Summary

The study revealed that blockchain transparency plays a vital role in improving trust and accountability, which in turn enhances the overall business performance of manufacturing firms. Blockchain traceability was found to strengthen supply chain visibility, thereby reducing operational inefficiencies and improving productivity. Among the blockchain dimensions examined, security had the most significant impact, as it safeguards critical business data and ensures operational reliability. Additionally, data integrity was shown to enhance decision-making accuracy and promote organizational efficiency. Overall, both the quantitative and qualitative analyses confirmed that blockchain adoption exerts a positive and significant effect on the business performance of manufacturing firms in Delta State, highlighting its strategic importance for competitiveness and sustainability.

Conclusion

This study examined the effect of blockchain technology on the business performance of selected

manufacturing firms in Delta State, Nigeria, using both quantitative and qualitative approaches. The analysis of 140 valid responses revealed that blockchain transparency, traceability, security, and data integrity each exert significant positive influences on business performance.

Specifically, blockchain security emerged as the most influential factor, underscoring the technology’s role in protecting business data, ensuring safe transactions, and fostering trust among partners and customers. Data integrity and transparency were also found to be strong drivers of performance, enabling accurate decision-making and enhancing accountability. Similarly, traceability improved supply chain monitoring, quality control, and customer satisfaction.

The findings affirm that blockchain adoption contributes meaningfully to operational efficiency, product authenticity, and corporate credibility in Nigeria’s manufacturing sector. However, the study also highlights persistent challenges such as limited technical expertise, infrastructural constraints, and regulatory uncertainty, which may hinder full-scale blockchain implementation.

In conclusion, blockchain technology stands as a strategic digital innovation capable of transforming the operational landscape of manufacturing firms in Delta State. When effectively integrated, it enhances performance, competitiveness, and long-term sustainability.

Recommendations

Based on the findings, the following recommendations are proposed:

The study recommends that manufacturing firms in Delta State should first invest in robust blockchain infrastructure by adopting digital platforms and tools that enhance data management, traceability, and security across operations.

There is a need for capacity building and continuous training to equip employees with the technical knowledge and skills required for effective blockchain implementation and cybersecurity management.

i. That regulatory support and institutional collaboration should be strengthened through clear government policies, industry standards, and partnerships between public and private sectors to promote innovation and ensure compliance with data protection laws.

ii. Lastly, firms should integrate blockchain into supply chain and operational systems while continuously evaluating its performance impact, promoting data integrity, and leveraging complementary technologies such as Artificial Intelligence (AI) and the Internet of Things (IoT) to drive sustained business growth and competitiveness.

The Madness of Power: Analyzing Caligula's Reign and Psychology Through Maslow's Hierarchy of Needs

SOYLU, Poyraz

Gülizar Zeki Obdan High School,
poyrazsoylu2010@gmail.com

Publication Date: 2025/11/28

Abstract

There were some significant leaders in the history of the countries and regions. They have not been forgotten for centuries. Some of them did great jobs in their presence, for their nations and countries and even humanity. However, some others have been remembered by their bloody and autocratic administration; for example, they tortured their public. Caligula is one example of the second type of leadership. Although he did not achieve any military or political success, he became infamous for his notorious behaviors. These include, not least, the appointment of his horse as a consul, an incestuous relationship with his sister, and even his absurd order for the sun to rise in the middle of the night. This study will dig out Caligula's turbulent life. The reason of his desire of brutality and inhumane treatments trace back to traumas of his childhood. Moreover, this article will apply Maslow's Hierarchy of Needs to Caligula's life sketch.

Keywords: Caligula, Hierarchy of Needs, Leader, Maslow, Roman Empire, Tyranny.

Introduction

Autocracy, when combined with psychological trauma and unmet emotional needs, can lead to devastating consequences for both rulers and their subjects. Caligula, one of Rome's most infamous emperors, serves as a compelling case study for the intersection between power and pathology. While historical records focus on his brutal decisions and eccentric behaviors, this paper adopts a psychological lens, employing Maslow's Hierarchy of Needs to interpret the emperor's descent into tyranny. This paper argues that Caligula's personal history — including loss, alienation, and emotional instability — prevented him from fulfilling his own psychological needs, which in turn manifested in destructive political choices that also denied those same needs to his subjects. Throughout history, leaders have played a crucial role in shaping the psychological and social realities of their societies. While some rulers guided their people toward prosperity and fulfillment, others plunged entire nations into fear and deprivation. Gaius Julius Caesar Augustus Germanicus, commonly known as Caligula, exemplifies the latter. By examining his reign through the lens of Abraham Maslow's Hierarchy of Needs, we can better understand how autocratic rule can suppress or distort the fundamental human needs of both individuals and societies.

Caligula's Life Experience

Caligula was the third emperor (AD 12-41) of the Roman Empire and the son of Germanicus (World History Encyclopedia). He came from the Julio-Claudian dynasty, to which the first five Roman emperors belonged. The name "Caligula" means "little soldier's sandal." Soldiers gave him this name because Caligula wanted to be a soldier from a young age and dressed like a soldier (Graham, 2025).

Although he himself rejected this nickname, he is still known as Caligula. While Augustus, the first Roman Emperor, was still on the throne, the question "Who will be the heir to the throne?" began to be asked. It was thought that the heir would be Germanicus, the father of Caligula. Augustus, however, chose Tiberius on the condition that he adopt Germanicus.

Germanicus was then sent to the east. While in the East, Tiberius is thought to have poisoned him on November 10, 19 (Graham, 2025). In 27, the young Caligula was sent to live with Tiberius' mother, Livia. Meanwhile, allegations have been made about Caligula that he had an incestuous relationship with his sister, but nothing clear can be said (Aysan, 2024). Caligula was always a favorite of Tiberius. There are many heretical gossips about Caligula, who stayed in Capri from 31 to 37 (Fenmere, 2025). Since Tiberius and Caligula were not very popular, it is normal for such rumors to occur. Caligula ascended the throne with the death of Tiberius in 37. According to one idea, Tiberius was strangled with a pillow so that

Caligula could ascend the throne earlier (Damon, 2012).

Betrays, assassinations, poisonings, and strangulations were commonplace in Rome. Even before Caligula ascended the throne, he participated in the torture of slaves and watched bloody gladiatorial games, even his entertainment was bloody (Holland, 2025).

Caligula's accession initially brought relief and optimism among the Roman people. They were finally freed from Tiberius' oppressive rule. Caligula was the first emperor to be admired by the whole world, from the place where the sun rises to the place where it sets by public (Philo, 41 CE/2021).

This was the beginning of a new era. In his early days, he was generous, although he was of a political nature. He overpaid the Praetorian guard, destroyed Tiberius' treason documents and declared treason prosecutions a thing of the past, recalled exiles, and helped those who suffered from the Imperial tax system. He removed sex offenders from the empire. It is also known to be quite extravagant for things like gladiatorial fights. These actions initially brought him quite a reputation in the eyes of the public.

In addition, he revived free elections for the people. He reopened the Roman Imperial annals, which had been closed during the reign of Tiberius. For these reasons, Caligula was called "The Sun" by the people. While everything was going well, Caligula's psychological problems arose. (Mallan, 2021)

When the heresies which Tiberius had suppressed while he was present were exposed, the people regretted it. It was thought that Caligula, who suffered a serious illness in the year he ascended the throne, would die, but Caligula survived. Historian Howard Hayes Scullard says (1982), "He emerged from his illness a monster of lust and a demonic tyrant. While Caligula was very respectful to the Senate at first, he gradually began to make maverick decisions. His relationship with the Senate is one of the most significant points in Caligula's period. In particular, his dismissal of the consuls in 39 without talking to the senate caused a rift with the senate.

He ordered everyone to shave their heads for fear of baldness, declared his beloved horse consul for fear of being assassinated, another famous scandal is intent to raise his horse, Incitatus, to consular rank (Miles, 2007).

However, it is known that this situation is not real. Incitatus was the favorite horse of Caligula, and he dressed Incitatus in purple, the color which represents royalty.

"The infamous incident where he appointed his beloved horse, Incitatus, as a consul served as both a mockery of senatorial authority and a stark reminder of the emperor's unchecked power. Instead of laughter, this act bred resentment, as senators felt they were being ridiculed rather than respected. "(Hawkinson, 2025, p. 148).

He reportedly ordered the sun to rise at night, wandered the corridors in fear, and had his sleep interrupted by constant suspicions of assassination. Caligula is one of the most paranoid people, history has ever seen. Serious issues or illnesses can occur in the life of a leader. Paranoia is the greatest enemy of a commander.

Caligula, who declared himself a living god (The History Hour, 2018), declared her a goddess when his sister, with whom he was in a relationship, died. He reportedly opened a brothel in his palace and was in the habit of taking the wives of members of the Senate to his own bedroom during social events, even though their husbands could only look after them as they left. He then described his sexual acts with his spouses in the presence of their husbands in a way that everyone could hear. All these heresies gradually increased, and he sold the spouses of high-ranking senators to the highest bidder (Holland, 2025).

These absurd behaviors had begun to anger the senate and assassination plans had begun to be made. Caligula spent excessively, both for his own pleasure and for his wants, and over time he melted the treasure left by Tiberius. He went beyond seeing himself as a god, beheading statues of the gods and making his own busts.

His excesses weakened Rome in every way, and he used the birth of his daughter as an excuse to collect extra money from the people in order to put his own heresies into practice. His harsh and unnecessary rules brought more blood and death to the Empire, and his paranoia led to the death of even those closest to him.

Surviving sources mention several political successes achieved by Caligula. During his reign, Mauretania, which had joined the empire, was restructured into two provinces. Herod Antipas was appointed governor of Judea. Several disturbances between Jews and Greeks in Alexandria and other eastern provinces were suppressed.

During the reign of Caligula, the ports of Rhegium and Sicily were improved. Grain imports from Egypt were increased. Public works were completed, temples were built, and walls repaired. Caligula was also portrayed, albeit reluctantly, as a very persuasive, good orator and generally popular in the eyes of the Roman public.

Despite these actions, Caligula, who had no military successes, wanted to conquer Britain, but his army did not trust him. Soldiers were right because their commander hasn't got an experience in the war field and even one of the respectful Emperor, Gaius Julius Caesar, couldn't conquer Britain completely. Therefore, there weren't any belief for Caligula to earn a power in Britain, and they don't make a mistake at this point.

When the army refused to cross the English Channel, Caligula's wish could not be fulfilled. A soldier must trust his/her commander otherwise even he/she fights

against a villager the result will be defeat. Caligula could not return empty-handed from this expedition, so he ordered the soldiers to collect seashells.

These seashells represented Caligula's victory over the god Neptune (Poseidon). When Roman Empire conquered Greece in 146 BC, they obsessed with Greek religion, culture, science and developed with this conquer.

"Graecia capta ferum victorem cepit (Greece, captured, captured a fierce conqueror.)" (Horace, 14 BC/2002). They adopted all of Greek mythology as their own religion and changed the names of the pantheon. For example, the chief god Zeus named as the larger planet in the solar system Jupiter.

This defeat was the last straw for the Senate, and a conspiracy was urgently planned. Caligula realized this and refused to enter the city. As he hadn't got any military success, his only purpose to conquer Britain was avoiding from death.

If he had returned from the British expedition successfully, he would have only been able to postpone his death a little because the Senate had wanted to get rid of Caligula for a long time and the unsuccessful British expedition had been a very justified reason for them.

His paranoia was clearly a necessity for being face to face with the Senate. In Roman Empire, the emperor's relation with Senate is critic for his future. Caligula was always stayed against Senate, actually he was against everyone during his period.

Caligula, who entered the city when his fear passed, left the arena where the Palatium games were held towards the end of January 41, under the pretext of eating and bathing. He was walking for his last time.

As he walked, a group of army men intercepted him, and Caligula was stabbed multiple times to death. Caligula learned by experience that he is not a god. The other assassin stabbed Caligula's wife, Caesonia, and killed her young daughter, Julia Drusilla, by banging her head against the wall (Josephus, Antiquities of the Jews XIX.1.15).

He was alone in his entire life, nevertheless not in death. Although the Senate wanted to take advantage of this assassination and rebuild the republic, this did not happen, Claudius became the new emperor. Claudius or Tiberius Claudius Caesar Augustus Germanicus did what Gaius Julius Caesar and Gaius Julius Caesar Augustus Germanicus could not do and established Roman rule in Britain (Scramuzza, 1940). Caligula is a mentally unstable leader according to some, addicted to the excess of all kinds of pleasures according to others, and sociopathic according to others.

Above all, his cruelty, arrogance, paranoia, military incompetence, indulgence, and perversion brought about the end of Caligula.

Caligula died consumed by hatred — not only for others but also for himself. The very people who once hailed him as "our sun" ultimately dismissed him as "our regret."

CALIGULA:

"Utinam populus Romanus unam cervicem haberet: "I wish the people of Rome had only one neck so I could separate it from the body in one stroke" (Holland, 2025).

Maslow's Hierarchy of Needs as a Framework to Understand Caligula's Rule

Abraham Maslow's hierarchy of needs, a psychological theory that classifies human motivation into five levels — physiological, safety, love/belonging, esteem, and self-actualization — offers a compelling framework to evaluate the societal and individual impact of imperial leadership. As Maslow himself noted, "These basic needs are physiological, safety, love, esteem, and self-actualization. They may be considered as needs arranged in a hierarchy of prepotency" (Maslow, 1943, p. 372).

When applied to the reign of Caligula, this framework reveals the systematic collapse of both public welfare and personal stability under autocratic excess. Caligula's life and policies, when viewed through Maslow's lens, demonstrate how unchecked power can distort not only the fulfillment of societal needs but also the ruler's own psychological development.

Caligula presents a psychological case, and if we aim to understand him comprehensively, Maslow's Hierarchy of Needs provides the most suitable framework. This analysis will examine Caligula's life through the five levels of the pyramid. Each part will describe characteristics, life standards, goals and failures of the most brutal leader in history.

The Collapse of the Pyramid: Maslow's Framework Applied to Caligula

Physiological Needs

The most basic layer of Maslow's pyramid concerns survival: food, water, rest, and shelter. In the early years of Caligula's rule, he attempted to address these needs by organizing gladiatorial games and other ways to have fun. At first glance, it might appear that an emperor would never struggle with basic physiological needs such as access to water, shelter, or clothing.

Yet in Caligula's case, such assumptions prove misleading. His pervasive paranoia undermined even these fundamental aspects of existence: he could not drink water without suspicion, could not rest without fear, and could not walk without guards. In the long term, even the presence of guards failed to provide reassurance, as he feared betrayal from those closest to him. Ultimately, he lacked trust not only in others but also in himself.

Safety Needs

Security of body, health, property, and legal justice are at the core of this second level. Caligula's reign is infamous for its pervasive atmosphere of paranoia

and fear. Arbitrary executions, political purges, and the dissolution of legal procedures destroyed any sense of personal or societal safety. His public spectacles of cruelty and mockery of legal institutions — including appointing his horse as consul — reveal a conscious disregard for this essential need.

The citizens of Rome, regardless of status, lived under the threat of random violence and persecution. We can say that Caligula is right to be a paranoid because if we look at the conclusion he died because of a suicide. But the real question is “Why he died because of a suicide not a heart attack or brain hemorrhage?”

Love and Belonging Needs

Social connection — love, friendship, familial ties — becomes almost impossible in an environment of fear. Caligula not only destroyed trust within the Senate but also invaded the private lives of his political rivals, even publicly humiliating them and their spouses. Allegations of incest and his theatrical treatment of relationships suggest that Caligula's personal ability to form genuine emotional bonds was severely compromised.

Instead of fostering communal spirit, he fostered isolation, surveillance, and betrayal. Caligula's idea of entertainment was completely different. We can also include the incident with the senators' wives in this topic. In this huge empire, even his relatives hated him. He can't afford his belonging needs. Think that you are sleeping with someone but neither you nor your partner loves this situation because this is only a necessity not an entertainment. Everything you do is a game and has no emotional reality. That means Caligula fails at this level again.

Esteem Needs

Statue means everything for an ordinary or popular person, because of this meaning Maslow puts “Esteem Needs” before the last level of his pyramid and made an excellent choice. The need for respect, recognition, and self-esteem plays a central role in Caligula's descent. Rather than earning admiration through just rule or military achievement, Caligula demanded divine worship. He declared himself a living god and sought to be feared rather than respected. His narcissism and obsession with status reflect an unfulfilled and disordered pursuit of esteem.

For the Roman population, meanwhile, the destruction of merit-based advancement and public dignity created a void in self-worth and societal stability. At first, everyone seemed to respect him very much, but then everything changed. The public thought that he was cursed and he would bring the destruction of Rome. In fact, he nearly did so yet ultimately fail even in that.

Self-Actualization

The highest level of Maslow's hierarchy involves achieving one's full potential and creative expression. Under Caligula's regime, cultural life suffered. Fear-based censorship and the suppression of intellectual freedom left little space for philosophical or artistic growth. Caligula's own sense of self-actualization was distorted by delusion: he sought transcendence through domination, humiliation, and divine pretense. What Maslow defines as personal growth became, in Caligula's case, self-destruction. Caligula could not reach the higher levels of the pyramid because he failed to satisfy even its most basic levels. The concept of self-actualization is very different for an Emperor such as Caligula. You might say that getting a promotion from work is enough for me. If you are Caligula you have to conquer, defeat, beat, unite with others, be acknowledged by the public, and be loved by your people.

Honestly, he remained only a tyrant and could not go beyond that. Perhaps his goal of self-realization was simply to cross the English Channel. But even in this goal he lost to a God who didn't exist. In fact, he was just someone trying to realize his own desires for self-actualization, because of this he declared himself as a god. According to the Roman tradition when the emperor dies the public remembers him as a god. However, this tradition isn't enough for Caligula, he wants to be remembered as a god while he is leaving, because his only purpose is to ensure obedience.

Conclusion

Caligula's psychological and behavioral condition appears deeply pathological. We can describe this tyrant as a psychopath or mentally ill. He failed in every way, he could not afford an emperor's responsibilities to the public, soldiers and senators. He failed as a husband, a leader, a commander, and even as a man by the standards of his own time. When examining the Pyramid of Maslow and apply to this whole failure man, we expect it to be at the top of the pyramid because the subject is an emperor not an ordinary man. However, we are facing someone who has reached the deep of the pyramid. This is why Caligula's life appears tragic. While many might aspire to lead the Roman Empire, few would wish to do so if it meant becoming “a Caligula.” If one were to assume the position of Caligula, the outcome would be clear: despite commanding an army, he remained profoundly isolated. His apparent power was undermined by alienation and mistrust, to the extent that even his own soldiers were reluctant to obey his orders. No one loves you, even the people you sleep with hate you, even your sister. His pervasive anxiety prevented him from achieving even the most basic need for restorative sleep. No matter how comfortable his bed might have been, paranoia pierced his rest like a bed of needles, leaving him restless and tormented. Neither respect, nor love, nor

security, nor success, nor any other good things in life you will have be. All you have is your position of no consequence, women who are disgusted by you, and alcohol that wants to spill on the floor and go to waste when it goes into your mouth. Now say it: would you want to be Caligula? Even an unemployed person may have some positions in their life; this can be a wife, a house, a child, a piece of fence, a T-shirt or anything else. Caligula doesn't even have a piece of fence to protect him. Understanding Caligula could only be achieved by adapting Maslow's pyramid. By examining Caligula through each level of Maslow's hierarchy of needs, it becomes evident that he exemplifies a profoundly disturbed psychological profile. His pervasive paranoia, inability to form meaningful relationships, and chronic failure to satisfy even basic human needs underscore the severity of his dysfunction. This analysis suggests that Caligula's case warrants careful and systematic study from both historical and psychological perspectives, providing valuable insights into the complex interaction between personal pathology and autocratic leadership.

Abstract

This qualitative study examines the critical relationship between ethical leadership and accountability in Nigeria's public service, exploring how ethical practices influence governance outcomes. The research identifies pervasive challenges including systemic corruption, lack of transparency, weak institutional frameworks, and political interference that undermine accountability mechanisms. Through content analysis of secondary sources including journal articles, government publications, and empirical studies, the investigation reveals that ethical failures in Nigeria's public service are multifaceted, stemming from historical precedents, organizational culture, and socioeconomic factors. The study establishes that ethical leadership characterized by integrity, accountability, transparency, and commitment to the public good is instrumental to achieving good governance and sustainable development. Findings indicate that transformational leadership approaches, coupled with strengthened institutional controls and cultural transformation, could significantly enhance accountability in the public sector. The research contributes to the existing literature by providing a comprehensive analysis of the interconnectedness between ethical leadership and accountability in the Nigerian context. Recommendations include institutional reforms, enhanced transparency mechanisms, leadership development programs, and the cultivation of an ethical organizational culture to promote accountability and good governance in Nigeria's public service.

Keywords: Ethical Leadership, Accountability, Public Service, Governance, Corruption, Nigeria

Introduction

The public service in Nigeria represents the institutional framework through which government policies are formulated and implemented, thereby serving as the engine room of governance and national development. Historically, Nigeria's public service has undergone significant reforms since the colonial period, with the 1976 reforms marking a major attempt to professionalize and enhance efficiency in the sector (Adebayo, 2020). Despite these reforms, the sector continues to grapple with challenges of inefficiency, politicization, and declining ethical standards. The concept of ethical leadership, which emphasizes principles such as transparency, accountability, integrity, and service to the public good, remains central to addressing these challenges and ensuring the proper functioning of public institutions (Okereke & Eme, 2022).

Nigeria's socioeconomic landscape reveals a paradox a country endowed with vast human and natural resources, yet consistently facing underdevelopment, poverty, and inequality. Scholars argue that this

contradiction is strongly tied to governance deficits, especially within the public service (Akinola, 2021). Issues such as nepotism, bribery, embezzlement, and bureaucratic bottlenecks have become entrenched, weakening institutional performance and eroding public confidence in government agencies. These unethical practices not only diminish service delivery but also stifle sustainable economic growth and social justice (Olowu & Oyedele, 2023).

The erosion of accountability in Nigeria's public service is a direct consequence of weak enforcement mechanisms and a culture of impunity among public officials. Studies show that accountability mechanisms such as audits, procurement monitoring, and anti-corruption frameworks are either poorly implemented or circumvented due to weak political will (Agbiboa, 2021). As a result, the credibility of the public service has been compromised, with the average citizen perceiving government institutions as self-serving rather than people-oriented. This situation underscores the urgency of embedding ethical leadership as a

guiding principle in Nigeria's governance framework (Adeosun, 2022).

In the broader theoretical discourse, ethical leadership and accountability have gained global recognition as key determinants of public sector effectiveness. Theories such as Transformational Leadership Theory and Agency Theory emphasize the role of leaders in fostering accountability, ethical behavior, and alignment of personal interests with public goals (Brown & Treviño, 2020). However, the application of these frameworks in Nigeria remains underexplored, with existing literature offering limited insights into how ethical leadership can be systematically cultivated to combat entrenched corruption and inefficiency in public institutions (Eneh, 2022).

Against this backdrop, this study seeks to bridge the gap by critically examining the relationship between ethical leadership and accountability in Nigeria's public service. By drawing from empirical evidence, theoretical perspectives, and comparative global practices, the study aims to provide actionable recommendations for strengthening institutional frameworks. Ultimately, the research contributes to the broader debate on governance reform in Africa, highlighting the need for leadership models rooted in ethics, transparency, and accountability to achieve sustainable national development (Oluwatobi & Okafor, 2023).

Statement of the Problem

The Nigerian public service is bedeviled by a plethora of ethical issues that have severely compromised its accountability mechanisms and service delivery capacity. Despite numerous reforms and anti-corruption initiatives, systemic corruption remains entrenched in the public sector, manifesting through various forms including bribery, embezzlement of funds meant for developmental projects, falsification of government documents for selfish motives, and inflation of contract figures. These unethical practices have become so normalized that they now represent a significant impediment to Nigeria's socioeconomic development.

The magnitude of corruption and ethical violations was particularly evident during the COVID-19 pandemic, when public officials brazenly looted palliative materials meant for vulnerable populations during lockdown periods. This incident highlighted the profound ethical crisis within Nigeria's public service and raised serious questions about the effectiveness of existing accountability mechanisms. The persistence of such practices suggests deep-rooted systemic issues that go beyond individual moral failings to encompass institutional and structural deficiencies.

Several interconnected factors contribute to this problematic situation. General poverty among the

populace creates an environment conducive to corruption, as public officials often seek alternative means of supplementing their income. The politicization of the public service has led to the appointment of unqualified personnel based on patronage rather than merit, further eroding professionalism and ethical standards. Additionally, weak regulatory instruments and enforcement mechanisms have created a culture of impunity where ethical violations often go unpunished.

The consequences of these ethical failures are far-reaching and multifaceted. They include poor service delivery, inadequate infrastructure, weakened public institutions, diminished public trust, and ultimately, the perpetuation of poverty and underdevelopment despite Nigeria's abundant resources. This situation necessitates a thorough investigation into the root causes of ethical violations in Nigeria's public service and the identification of practical strategies for promoting ethical leadership and accountability.

Objectives of the Study

This research aims to comprehensively examine the phenomenon of ethical leadership and accountability in Nigeria's public service. The specific objectives are:

1. To investigate the perception and manifestation of ethical leadership within Nigeria's public service sector, examining the extent to which political leaders exhibit accountability and integrity as instruments of governance.
2. To identify and analyze the institutional and cultural factors that constrain ethical behavior and accountability in Nigeria's public service, including poverty, corrupt practices, weak regulatory frameworks, and organizational culture.
3. To propose evidence-based strategic recommendations for promoting ethical leadership and strengthening accountability mechanisms in Nigeria's public service, focusing on institutional reforms, cultural transformation, and leadership development.

Research Questions

To guide this investigation, the following research questions have been formulated:

1. To what extent do Nigeria's political leaders exhibit accountability and integrity as instruments of governance, and how are these ethical leadership qualities perceived by the public?
2. What are the primary institutional, cultural, and socioeconomic factors that constrain ethical behavior and accountability in Nigeria's public service?
3. What practical strategies and mechanisms can be implemented to promote ethical leadership and strengthen accountability in Nigeria's public service?

Conceptual Review

Ethical Leadership

Ethical leadership in public service is a foundational pillar for building trust and ensuring effective governance. It transcends mere compliance with rules, representing a holistic commitment to moral principles that guide both personal conduct and organizational culture. In today's complex environment, this involves navigating novel dilemmas such as digital privacy, algorithmic bias in automated public service delivery, and the ethical management of vast public datasets (Margetts & Dorobantu, 2019). The concept is not static; it evolves to meet new challenges, demanding that leaders be both morally aware and technically proficient to make decisions that are not only legal but also just and equitable for the citizens they serve. This is particularly critical in an era of deepfakes and misinformation, where public trust is fragile and easily eroded by perceived ethical lapses (Bennett & Livingston, 2018).

The conceptual dimensions of ethical leadership, while rooted in the "moral person" and "moral manager" framework, have been expanded to include a "moral entrepreneur" role in the digital age (Hassan, Wright, & Yukl, 2021). The moral person dimension focuses on the leader's individual character: their honesty, integrity, fairness, and trustworthiness, demonstrated through consistent personal actions. The moral manager dimension is outwardly focused, involving the active promotion of ethical conduct within the organization through clear communication, reinforcement, and holding subordinates accountable. A contemporary example of this duality can be seen in the leadership responses to crises; a leader who transparently acknowledges institutional failures (moral person) and then implements systemic reforms to prevent recurrence (moral manager) embodies both dimensions effectively.

In the Nigerian context, the relevance of ethical leadership is magnified by persistent challenges such as corruption, nepotism, and a historical deficit of public trust. The conceptualization of an ethical leader here must include the courage to resist deeply entrenched informal systems of patronage ("godfatherism") and to make decisions based solely on merit and public interest, a challenge documented in recent analyses of sub-national governance (Okafor & Fatile, 2022). This is exemplified by the ongoing efforts of agencies like the Independent Corrupt Practices and Other Related Offences Commission (ICPC), whose effectiveness is directly tied to the perceived ethical fortitude of its leadership. When such leaders actively "show and tell" their values, they begin to counteract a culture of cynicism and set a new standard for public service.

The practical application of ethical leadership faces significant hurdles, including political pressure,

cultural norms that may conflate loyalty with integrity, and a lack of robust protective mechanisms for whistleblowers. Conceptually, this suggests that ethical leadership cannot be viewed in isolation; it is interdependent with the broader governance ecosystem. For it to flourish, it must be supported by strong, impartial institutions and a vibrant civil society that is empowered to demand accountability, as evidenced by the mixed results of anti-corruption initiatives across Africa (Persson, Rothstein, & Teorell, 2023). Therefore, strengthening ethical leadership is not merely about training individuals but about systematically creating an environment that rewards ethical behavior and imposes tangible costs on ethical violations.

Accountability

Accountability is the bedrock of democratic governance, constituting the mechanisms through which public officials are held responsible for their actions, use of resources, and the outcomes they achieve. Its conceptual core involves three key elements: transparency (openness about actions), answerability (the obligation to justify decisions), and enforceability (the presence of meaningful sanctions for misconduct or poor performance). In the 21st century, the concept has been radically expanded by technology-enabled "social accountability," where citizens and civil society organizations use tools like open data platforms, social media activism, and crowdsourced monitoring to directly hold power to account, often bypassing sluggish or compromised formal channels (Peixoto & Sifry, 2017).

The conceptual framework of accountability operates through multiple, overlapping channels: political, legal, administrative, and professional. A robust system requires these horizontal (between state institutions) and vertical (from state to citizens) mechanisms to function in tandem. Contemporary scholarship emphasizes the rise of "diagonal accountability," a hybrid where civil society actors directly engage with and strengthen horizontal agencies like audit institutions and anti-corruption commissions (Peruzzotti & Smulovitz, 2022). For instance, the audit reports generated by the Office of the Auditor-General for the Federation (a horizontal mechanism) can be leveraged by the media and advocacy by groups like SERAP (social accountability) to pressure the Public Accounts Committees into action, creating a more potent multi-layered web of oversight.

In Nigeria, the conceptual ideal of accountability starkly contrasts with its practical application. While the framework exists on paper, the system is often weakened by politicization, institutional capture, and selective enforcement. A stark contemporary illustration is the persistent and well-documented delays by the National Assembly in reviewing and

acting upon the annual audit reports submitted by the Auditor-General, a critical failure that breaks the chain of answerability and enforceability (International Budget Partnership, 2023). This perpetuates a culture of impunity, where the likelihood of facing consequences for misappropriation is perceived as low, thus enabling both grand corruption and petty malfeasance alike.

Strengthening accountability conceptually requires moving beyond a focus solely on punitive, retrospective measures to building integrated, proactive systems that prevent misconduct. This includes leveraging technology for real-time transparency, such

as the Government Integrated Financial Management Information System (GIFMIS) and the Treasury Single Account (TSA), though their effectiveness is itself dependent on strong political will and technical capacity (Ojo, 2021). Furthermore, promoting performance-based accountability, which ties rewards and sanctions to measurable results and service delivery outcomes, can shift the focus from process to impact. Ultimately, a reconceptualization of accountability in Nigeria must address the underlying political economy factors that weaken institutions and foster an environment where unethical conduct is rationalized and often rewarded.

Conceptual Framework

This diagram illustrates a conceptual framework where Ethical Leadership serves as the foundational driver for effective governance. The components of ethical leadership such as integrity, transparency, and a commitment to the public interest directly enable the implementation of robust Accountability Mechanisms, including audits, performance monitoring, and citizen engagement. These mechanisms act as the critical link, translating ethical principles into tangible actions. Finally, the effective functioning of these accountability processes leads to desired Governance Outcomes, such as reduced corruption, improved public service delivery, and, ultimately, the cultivation of greater public trust. The framework demonstrates a clear causal pathway from leadership values to concrete results through the essential medium of accountability.

Theoretical Framework

Transformational Leadership Theory:

Transformational Leadership Theory, initially conceptualized by Burns (1978) and later expanded by Bass (1985), provides a foundational lens for analyzing leadership effectiveness, particularly in relation to

ethics and accountability. The theory posits that transformational leaders influence their followers by appealing to higher moral values and ideals rather than self-interest. Key components of this leadership style include idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Bass & Riggio, 2006). Through these dimensions, transformational leaders can create meaningful organizational change by shaping values, instilling purpose, and elevating follower commitment to collective goals.

In the Nigerian public service, where issues of corruption, weak institutional accountability, and leadership failures are recurrent, transformational leadership theory offers a compelling framework to understand how ethical leadership can be cultivated. Leaders who demonstrate authenticity, moral integrity, and a commitment to national service can inspire civil servants to emulate similar values, thereby improving institutional performance and public trust. According to Avolio and Walumbwa (2014), transformational leaders serve as ethical role models, which is particularly important in governance systems where leadership deficits are deeply entrenched.

Transformational leadership also aligns with the increasing call for public sector reform in developing countries, especially where leadership effectiveness is often undermined by systemic constraints. Studies such as those by Oreg and Berson (2019) have shown that transformational leadership significantly improves organizational citizenship behavior and reduces unethical practices in bureaucratic settings. In Nigeria's public service, this implies that civil servants who work under transformational leaders are more likely to resist corrupt practices, adhere to institutional regulations, and prioritize service delivery outcomes. This transformation is not only behavioral but cultural, embedding ethics and accountability into the core fabric of public institutions.

Moreover, the theory emphasizes the importance of intellectual stimulation, which encourages innovation and critical thinking in public service. Leaders who foster open dialogue and challenge traditional bureaucratic inefficiencies can empower employees to develop creative solutions to longstanding governance problems. As argued by Northouse (2021), such leadership approaches can shift organizational mindsets from passive rule-following to proactive engagement with public challenges. In the Nigerian context, where rigid hierarchies often stifle innovation, transformational leadership can serve as a catalyst for cultural change and institutional modernization.

In conclusion, Transformational Leadership Theory provides a robust theoretical foundation for exploring ethical leadership and accountability in Nigeria's public service. Its emphasis on moral leadership, inspirational vision, and follower development is particularly relevant in a governance context characterized by ethical lapses and institutional decay. Contemporary research underscores the theory's applicability to public sector reform, especially in environments where ethical leadership is urgently needed to rebuild trust and improve service delivery (Banks et al., 2016). This framework thus informs the current study's exploration of how ethical leadership can be operationalized to strengthen accountability mechanisms within Nigeria's public institutions.

Empirical Review

Several empirical studies have investigated the intersection of ethical leadership and accountability within Nigeria's public service, revealing deep-rooted systemic issues and the challenges confronting reform. Igbokwe-Ibeto and Osakede (2023) conducted a comprehensive assessment of ethical violations in Nigeria's public service, identifying persistent misconduct such as bribery, contract inflation, embezzlement, and document falsification. These malpractices were attributed to entrenched corruption, widespread poverty, weak enforcement mechanisms,

and the politicization of public offices. Their study emphasized the role of institutional failure in enabling unethical behavior and recommended reforms such as empowering professional bodies within the civil service, developing anti-crime tools, and strengthening accountability mechanisms across ministries and agencies.

In a related study, Ngare (2023) explored ethical leadership from the perspective of political accountability and found that successive Nigerian administrations consistently failed to institutionalize integrity and public engagement in governance. The study emphasized that public trust in government remains critically low due to leaders' reluctance to uphold transparency and include citizens in decision-making. Ngare concluded that accountability and integrity are not merely ethical virtues but fundamental requirements for sustainable governance. The research underscored that the absence of these values undermines policy legitimacy, disrupts service delivery, and fosters citizen apathy, thereby complicating the public sector reform agenda in Nigeria.

Further empirical evidence is provided by Okagbue (2011), whose research focused on ethical leadership and governance in Nigerian local governments. The study found that public servants overwhelmingly preferred leadership styles rooted in honesty, transparency, and citizen engagement. Civil servants interviewed during the study identified ethical leadership as a catalyst for enhanced service delivery and public confidence. Notably, the research revealed that ethical leadership can be a transformative force when linked with accountability, transparency, and participatory governance. These findings highlight the potential of ethical leadership not just to mitigate corruption, but to create an enabling environment for socioeconomic development and the effective utilization of public resources.

A more recent study by Orie and Egbe (2025) examined the implications of ethical leadership on sustainable development outcomes in Anambra State. The researchers found a direct correlation between strong ethical leadership, institutional governance, and successful implementation of development projects. The study noted that where transparency and stakeholder engagement were present, development outcomes were significantly more positive. Moreover, the research reinforced the idea that ethical leadership is foundational for ensuring long-term development and public trust. It recommended that government policies explicitly integrate ethical governance frameworks and leadership training for public officials to bridge the accountability gap and promote public sector efficiency.

Methodology

This study adopted a qualitative research design, specifically utilizing content analysis to explore the phenomena of ethical leadership and accountability within Nigeria's public service. A qualitative approach was chosen because it allows for an in-depth, contextual understanding of leadership behavior, institutional dynamics, and socio-cultural factors influencing governance. This method enables the researcher to critically engage with the meanings, themes, and patterns embedded within existing literature, policy documents, reports, and scholarly articles.

The content analysis technique involved the systematic review and interpretation of secondary data drawn from peer-reviewed journals, government publications, organizational reports, and existing empirical studies related to ethical leadership, public service accountability, and governance in Nigeria. Key search terms included "ethical leadership in Nigeria," "public service accountability," "governance challenges," and "transformational leadership in Africa." The documents were selected based on relevance, credibility, and recency (with a preference for sources published between 2010 and 2025), ensuring that the findings are grounded in contemporary evidence and perspectives. This methodology enabled the researcher to identify recurring themes such as integrity deficits, weak regulatory frameworks, politicization of leadership, and cultural constraints within Nigeria's public institutions. Moreover, the qualitative design provided room to compare and synthesize findings from different authors and regions within Nigeria, revealing both systemic patterns and contextual specificities. Through this process, the study was able to derive strategic recommendations informed by real-world challenges and supported by scholarly consensus.

The data analysis process involved thematic coding, where recurring ideas, narratives, and findings were organized into categories aligned with the study's objectives namely, the perception of ethical leadership, institutional and cultural constraints, and recommendations for promoting accountability. This method facilitated a structured interpretation of qualitative data while preserving the richness of contextual insights.

Overall, the chosen methodology allowed the study to explore ethical leadership and accountability not just as abstract concepts, but as lived realities in Nigeria's public service. The reliance on well-documented secondary data enhanced the credibility of findings and ensured that recommendations were grounded in established knowledge and current governance debates.

Data Sources and Collection

This study utilized a broad range of secondary sources to explore ethical leadership and accountability in

Nigeria's public service. Materials reviewed included peer-reviewed journal articles, textbooks, newspapers, government publications, magazines, and empirical studies relevant to public sector ethics and governance. These sources were identified through systematic searches of academic databases such as Google Scholar, JSTOR, and Scopus, using keywords like "ethical leadership in Nigeria," "public accountability," and "transformational leadership." Emphasis was placed on literature published between 2010 and 2025 to ensure the inclusion of current data and insights.

Additionally, manual reviews of reference lists were conducted to identify further relevant materials. The selected documents were evaluated for relevance, credibility, and academic rigor, providing a comprehensive base for qualitative content analysis. This method allowed the study to critically synthesize existing knowledge, highlight patterns, and offer insights into the challenges and opportunities for promoting ethical leadership and accountability in Nigeria's public service.

Data Analysis

The collected data were analyzed using qualitative content analysis, involving a systematic process of identifying, coding, and categorizing patterns and themes related to ethical leadership and accountability. This approach enabled the reduction of extensive data into manageable themes, allowing for meaningful interpretation and inference. The analysis focused on both manifest content, which refers to the directly observable information, and latent content, which involves uncovering the underlying meanings and contextual nuances. Through ongoing engagement with the source materials, the study ensured the reliability of its interpretations and developed a comprehensive understanding of the complex phenomena under investigation.

Ethical Considerations

The research adhered to ethical standards for secondary data analysis by appropriately acknowledging all sources through proper citations and references. Intellectual honesty and integrity were maintained throughout the study by accurately representing the findings and arguments from the source materials, ensuring there was no misrepresentation or manipulation of information. This careful attention to ethical considerations upheld the credibility and reliability of the research.

Discussion of Findings

The analysis of secondary sources revealed several key findings regarding ethical leadership and accountability in Nigeria's public service:

Pervasive Ethical Violations and Systemic Corruption:

The study confirmed the existence of widespread ethical violations in Nigeria's public service, ranging from petty corruption to grand misappropriation of public funds. These violations have become institutionalized and normalized within the system, creating a culture where ethical conduct is often the exception rather than the norm. The pervasiveness of corruption has significantly undermined public trust in government institutions and impaired the effectiveness of service delivery. Particularly concerning was the finding that ethical violations persisted even during emergency situations such as the COVID-19 pandemic, when public officials looted palliative materials meant for vulnerable populations. This demonstrates the depth of the ethical crisis within Nigeria's public service and suggests that existing accountability mechanisms are insufficient to deter misconduct, especially among those in leadership positions.

Weak Institutional Frameworks and Enforcement Mechanisms:

A critical finding of this study is the weakness of institutional frameworks designed to promote ethical conduct and ensure accountability in Nigeria's public service. Although Nigeria has established various institutions and regulations to combat corruption and enforce accountability, these mechanisms have proven ineffective due to political interference, inadequate resources, and weak enforcement capacity. The study revealed that regulatory capture has been a significant problem, with political leaders often interfering with the operations of accountability institutions to protect themselves and their allies from scrutiny. This has created a culture of impunity where public officials can engage in ethical violations with minimal fear of consequences. Additionally, the judicial system has been compromised in many cases, further weakening the accountability framework.

Socioeconomic and Cultural Factors Enabling Ethical Violations:

The research identified several socioeconomic and cultural factors that contribute to ethical violations in Nigeria's public service. General poverty among the population has created pressure on public officials to seek alternative means of income generation, often through corrupt practices. The politicization of the public service has led to the appointment of unqualified personnel based on patronage rather than merit, further eroding professionalism and ethical standards. Additionally, the study found that the legacy of colonial administration continues to influence ethical practices in Nigeria's public service. The colonial administration was characterized by authoritarianism

and extraction rather than service to the public, and elements of this legacy persist in contemporary administrative practices. This historical context helps explain why ethical leadership and accountability have been difficult to institutionalize in Nigeria's public service.

Leadership Failure and Erosion of Public Trust:

The study documented a crisis of leadership in Nigeria's public service, with successive political leaders failing to exemplify accountability and integrity in governance. This leadership failure has had a trickle-down effect throughout the public service, creating an environment where ethical violations are tolerated and even expected. The erosion of public trust has been both a cause and consequence of unethical leadership, as citizens' diminishing faith in public institutions reduces their willingness to hold leaders accountable while also justifying further ethical violations by public officials. This vicious cycle has been difficult to break, as each generation of leaders seems to perpetuate the patterns of misconduct established by their predecessors.

Conclusion

This study has examined the critical issues of ethical leadership and accountability in Nigeria's public service, revealing a complex web of challenges that have significantly impaired the effectiveness of governance and service delivery. The research demonstrates that ethical violations are pervasive and systemic, ranging from petty corruption to grand misappropriation of public funds. These violations are facilitated by weak institutional frameworks, socioeconomic factors, and a culture of impunity that has developed over decades.

The interrelationship between ethical leadership and accountability has been clearly established, with weaknesses in both areas creating a vicious cycle that undermines good governance. Ethical leadership is essential for establishing the moral tone and cultural norms that support accountability, while robust accountability mechanisms are necessary to reinforce ethical leadership by providing consequences for violations. The absence of both elements in Nigeria's public service has resulted in poor service delivery, weakened institutions, diminished public trust, and ultimately, the perpetuation of poverty and underdevelopment despite Nigeria's abundant resources. The study concludes that addressing the challenges of ethical leadership and accountability in Nigeria's public service requires a comprehensive approach that addresses both individual and institutional dimensions. Transformational leadership that inspires ethical conduct must be complemented by institutional reforms that create effective accountability mechanisms.

Additionally, socioeconomic factors that enable corruption must be addressed through broader policy interventions aimed at poverty reduction and the promotion of inclusive development.

Recommendations

Based on the findings of this study, the following recommendations are proposed to enhance ethical leadership and accountability in Nigeria's public service:

1. **Institutional Strengthening:** Public institutions responsible for ensuring accountability should be strengthened with adequate resources, operational independence, and protected mandates to minimize political interference. This includes anti-corruption agencies, audit institutions, and the judiciary. Specifically, legislation protecting these institutions from political manipulation should be enacted and enforced.
2. **Leadership Development and Ethics Training:** Comprehensive leadership development programs incorporating ethics training should be implemented at all levels of the public service. These programs should emphasize the principles and practices of ethical leadership, focusing on values such as integrity, transparency, and accountability. Such training should be mandatory for all public officials, particularly those in leadership positions.
3. **Transparency and Open Government Initiatives:** The government should implement robust transparency initiatives including open data platforms, public access to information, and citizen engagement mechanisms. The Open Tendering System for government contracts implemented in Anambra State represents a good practice that could be scaled nationally to reduce corruption in public procurement.
4. **Performance Management and Accountability Systems:** Effective performance management systems with clear metrics and consequences for non-performance should be established throughout the

public service. These systems should link performance evaluation to rewards and sanctions, creating incentives for ethical conduct and discouraging violations.

5. **Socioeconomic Reforms:** Broader socioeconomic reforms addressing poverty and inequality should be implemented to reduce the pressures that contribute to corrupt practices. This includes reviewing the compensation structure for public servants to ensure living wages that reduce the temptation for unethical supplementation of income.

Suggestions for Further Study

Based on the limitations and findings of this research, the following areas are recommended for further investigation:

1. **Comparative Studies:** Research comparing ethical leadership and accountability mechanisms in Nigeria's public service with those of other countries (both within and outside Africa) could provide valuable insights into context-specific and transferable solutions.
2. **Sector-Specific Analyses:** Studies focusing on specific sectors of Nigeria's public service (such as health, education, or security) could reveal sector-specific challenges and opportunities for promoting ethical leadership and accountability.
3. **Longitudinal Research:** Investigations tracking changes in ethical leadership and accountability practices over time would help assess the effectiveness of interventions and reforms aimed at addressing these issues.
4. **Quantitative Assessments:** Research employing quantitative methods to measure the prevalence and impact of ethical violations would provide valuable data for evidence-based policy formulation and resource allocation.
5. **Intersectional Studies:** Examinations of how factors such as gender, ethnicity, and religion intersect with ethical leadership and accountability practices could reveal important insights for targeted interventions.

Abstract

Organizational justice has become a central idea in explaining how fairness influences employee behavior and workplace outcomes. In today's organizations, where workers are more conscious of their rights and expectations, fairness is no longer just an ethical concern; it is a strategic requirement. This study examined the critical role of organizational justice to organizational performance, employee commitment, and long-term sustainability. The study was anchored on Organizational Support Theory (OST), which offers a powerful theoretical framework for highlighting the strategic importance of organizational justice in modern organizations. Using a historical research design, the study reviews major theories and scholarly discussions on justice in organizational life. It focuses on the dimensions of justice, while exploring how they have developed over time and been applied in practice. This approach helps to highlight the continuing relevance of fairness to current workplace issues such as diversity, talent retention, and organizational image. Organizations that prioritize fairness in their procedures, decision-making, and distribution of resources are more likely to foster trust, minimize workplace conflicts, and maintain a sustainable competitive edge. On the other hand, a lack of fairness often results in employee dissatisfaction, resistance, and damage to organizational credibility. The study concluded that organizational justice should be regarded as a strategic foundation for modern organizations. By embedding fairness into workplace practices, organizations can strengthen collaboration, stimulate innovation, and secure long-term growth in today's highly competitive environment. It is recommended, among others, that policy makers and organizational leaders should align organizational justice with strategic planning by connecting fairness initiatives to broader objectives such as improving employee retention, enhancing organizational reputation, and achieving sustainable performance.

Keywords: *Justice, fairness, organizational credibility, strategy, workplace outcomes*

Introduction

Although global research consistently underscores the vital role of organizational justice in shaping workplace dynamics and outcomes, variations remain in how fairness is interpreted and practiced across different countries and industries. In societies with strong institutions and transparent governance, fairness is more deeply embedded in organizational structures, resulting in higher employee trust, satisfaction, and productivity. Conversely, environments marked by weak institutional frameworks, rigid hierarchies, and poor communication often suffer from widespread perceptions of unfairness, leading to low morale, disengagement, and diminished performance.

Over the years, organizational justice has emerged as a central theme in management and organizational behavior studies, reflecting the growing recognition that fairness is indispensable for motivating employees, sustaining satisfaction, and driving organizational success. Broadly, organizational justice captures how employees perceive fairness in decision-making, organizational processes, and interpersonal treatment (Colquitt et al., 2001). With workplaces constantly adapting to globalization, technological innovations, and diverse workforce needs, justice has transitioned from being a purely ethical concern to a strategic imperative (Cropanzano et al., 2017).

In today's highly competitive landscape, human capital is a key determinant of sustainability. Employees who

experience fairness are more likely to remain committed, collaborative, and innovative, thereby strengthening organizational performance (Al Aina & Atan, 2020). Conversely, unfair treatment often fuels counterproductive behaviors, higher turnover, and weakened trust in leadership (Greenberg, 1990; Hamdani & Jufrizen, 2023). Ensuring fairness, therefore, extends beyond moral responsibility to becoming a foundation for organizational resilience and effectiveness.

Organizational justice is commonly explored through three main dimensions: distributive justice, which relates to fairness in outcomes; procedural justice, which emphasizes fairness in decision-making processes; and interactional justice, which focuses on fairness in communication and interpersonal treatment (Colquitt, 2001; Hamdani & Jufrizen, 2023). Collectively, these dimensions shape how employees perceive justice and influence the culture of an organization.

While much research has examined these dimensions individually, limited studies have considered their combined effects on employee outcomes, especially within diverse cultural and organizational settings. Even fewer investigations have focused on how justice functions in rapidly changing workplaces shaped by the COVID-19 pandemic, remote and hybrid work models, and digital transformation. These shifts underscore the urgency of exploring how fair perceptions evolve in modern work environments and their ongoing impact on employee performance. This study, therefore, examined the strategic role of organizational justice in modern organizations, emphasizing its relevance for fostering employee engagement, workplace harmony, and sustainable competitive advantage.

Review of Related Literature

Justice is generally equated with fairness, and the two concepts are often used interchangeably. It reflects the belief that actions or decisions are morally right, based on ethical values, equity, religious principles, or legal standards. In everyday life, people are highly sensitive to issues of fairness, especially in organizational settings where employees constantly assess whether workplace decisions and practices are just (Chandrawaty & Widodo, 2021). These perceptions strongly influence their attitudes and behaviours. When fairness is evident, employees tend to react positively, showing higher motivation and commitment. Conversely, perceptions of injustice often trigger dissatisfaction, disengagement, or resistance. For this reason, fairness is a central concern for organizations, shaping employee morale, motivation, and job performance. In practice, workplace justice often encompasses fair pay, equal opportunities for career

advancement, unbiased recruitment processes, and transparent decision-making systems.

Justice is also regarded as a universal norm and a fundamental human right, rooted in the dignity of individuals, who deserve fair treatment in every circumstance, including within organizations. From this perspective, organizational justice refers to employees' perceptions of fairness in the way they are treated compared to others. According to Hamdani and Jufrizen (2023), organizational justice consists of three major dimensions: distributive justice, which focuses on fairness in outcomes; procedural justice, which evaluates fairness in processes; and interactional justice, which emphasizes respectful communication and treatment. Several factors shape how justice is perceived in organizations. These include the nature and clarity of assigned tasks, employees' trust in their leaders, the frequency of constructive feedback, managerial integrity in applying rules fairly and consistently, and the overall organizational climate, which sets the tone for how employees experience fairness in their workplace.

Robbins and Judge (2009) describe justice as an ethical standard that ensures rules are applied consistently and impartially, with the goal of achieving a fair balance in the distribution of benefits and costs. Within organizations, justice reflects how employees perceive fairness in their workplace. These perceptions have attracted considerable attention because of their strong influence on both individual and organizational outcomes. Justice is considered one of the most fundamental aspects of human life, serving as a foundation for growth and the advancement of societies. Since organizations operate as social systems, their stability and sustainability depend heavily on the degree to which justice is upheld among their members. Much of the research on justice has focused on how employees evaluate the fairness of what they receive from their organization compared to what they contribute (Afjeh, 2017). In this regard, justice is understood as a moral and ethical principle that emphasizes fairness, equality, law, and even faith-based values.

The concept of organizational justice was formally introduced by Greenberg in 1987. It focuses on how employees assess the fairness of organizational behaviour and how those assessments shape their own attitudes and actions. Put simply, organizational justice concerns the extent to which employees perceive fairness in their workplace. This concept has been a central topic in management, organizational behaviour, and psychology research (Parker & Kohnmeyer, 2005). Different scholars have defined organizational justice in diverse ways. Okocha and Anyanwu (2016), for example, describe it as the role of equity within the workplace, emphasizing how organizations treat their

employees in line with moral and ethical standards. It also encompasses how employees accept or reject the behaviour of management. Similarly, Kalay (2016) provides a broad perspective, defining organizational justice as the evaluation of management decisions concerning responsibility delegation, empowerment, compensation, reward allocation, workplace policies, and the transparency of decision-making processes. In essence, organizational justice captures employees' perceptions of fairness across economic, social, and managerial dimensions of organizational life.

Imran (2016) describes organizational justice as the fair use of procedures and processes by leaders in dealing with employees to achieve positive workplace outcomes. It focuses on how workers evaluate fairness in their treatment and how such judgments affect other aspects of their work experience. In a similar view, Ohiorenoya and Eguavoen (2019) define organizational justice as employees' perceptions of fairness in organizational treatment, often reflected in reward systems that ensure compensation corresponds fairly with effort and performance. Zayer and Benabdelhadi (2020) expand this by highlighting that organizational justice involves fairness perceptions related to processes, outcomes, and interpersonal treatment within the organization. It plays a vital role in organizational behaviour and human resource management because it influences employee attitudes and behaviours. When fairness is perceived, employees show stronger commitment, trust, satisfaction, and engagement. In contrast, perceptions of unfairness can lead to dissatisfaction, low morale, absenteeism, and turnover, thereby undermining workplace productivity (Rowland & Hall, 2012).

Nurak and Riana (2017) emphasize the moral and ethical conduct of managers in decision-making as a key determinant of organizational justice, while Timan et al. (2024) describe it as the degree to which employees feel treated equally by their superiors. In essence, it represents employees' general perceptions of fairness in organizational decisions and practices. Beyond individual attitudes, organizational justice also impacts wider organizational outcomes. A just workplace strengthens trust between employees and management, reduces conflict, and nurtures collaboration and respect. It also enhances organizational reputation, supports talent retention, and promotes long-term sustainability (Al Aina & Atan, 2020). By applying fairness across dimensions such as resource distribution, promotions, compensation, performance appraisal, and conflict resolution, organizations foster inclusive and equitable environments. This not only motivates employees and sustains engagement but also contributes to achieving strategic goals (Cropanzano et al., 2007; Kolawole et al., 2025; Timan et al., 2024).

Dimensions of Organizational Justice

According to Hamdani and Jufrizen (2023), organizational justice can be understood through four key dimensions that shape how employees perceive fairness in the workplace. These are distributive justice, procedural justice, interactional justice, and informational justice.

Distributive Justice

Distributive justice focuses on the fairness of outcomes such as pay, promotions, job security, and recognition. Employees usually assess fairness by comparing their input–output ratio (e.g., effort, skills, or experience versus salary, promotion, or rewards) with that of their colleagues (Yetgin, 2024). When resources are shared fairly, employees experience higher job satisfaction, while unfairness can trigger dissatisfaction, low effort, or intentions to quit (Biswas & Ramaswami, 2013). Similarly, Harif et al. (2019) note that employees judge fairness by comparing their outcomes with others, and unfair results may lead them to distort their own or others' contributions. Timan et al. (2024) expand this by linking distributive justice to fairness in resource allocation, compensation, and even employee health outcomes, highlighting that unfairness often generates negative emotions and behaviors.

Procedural Justice

While distributive justice emphasizes results, procedural justice centers on the fairness of the processes used to reach those results. Transparent, consistent, and inclusive decision-making processes, such as promotion or salary review procedures, strengthen employees' trust, job satisfaction, and commitment (Azubuike & Madubochi, 2021). Conversely, when processes are perceived as biased or unfair, employees may feel stressed, disengaged, or even exhibit absenteeism. Timan et al. (2024) emphasize that fair procedures build legitimacy, encourage voluntary cooperation, and foster trust, while unfair ones generate resistance and distrust.

Interactional Justice

Interactional justice concerns the quality of interpersonal treatment employees receive, focusing on respect, empathy, honesty, and dignity. Faruk (2016) stresses that fairness in supervisor–employee interactions is crucial for maintaining positive relationships. Timan et al. (2024) distinguish two elements: interpersonal justice (respectful treatment) and informational justice (honest explanations). Ajala (2015) adds that truthfulness, respect, absence of prejudice, and timely justification or apology when mistakes occur can enhance employees' sense of fairness.

Informational Justice

Informational justice deals specifically with the adequacy, transparency, and clarity of communication from management (Lünich et al., 2024). It emphasizes not only informing employees but also explaining the reason behind organizational decisions. Faruk (2016) highlights that while interactional justice focuses on *how* communication is delivered (respectfully or not), informational justice emphasizes *what* is communicated (accuracy and completeness). Marso and Anggreyani (2024) argue that clear and timely updates foster trust and psychological safety, enabling employees to voice concerns and contribute effectively. In contrast, vague or deceptive communication damages trust and increases dissatisfaction.

When combined, these four dimensions, distributive, procedural, interactional, and informational justice form a comprehensive framework for understanding organizational fairness. Studies (e.g., Jung & Ali, 2017; Yoon & You, 2016) consistently show that high perceptions of justice enhance job satisfaction, loyalty, cooperation, and overall performance. Conversely, when justice is lacking, organizations face higher turnover, stress, and disengagement. Ultimately, organizational justice is essential for building a positive, committed, and productive workforce. Rizwan (2014) highlights that organizational justice is shaped by four fundamental factors: equitable compensation, transparent employee selection, merit-based promotion, and objective workplace relationships. Together, these elements form the basis of how employees perceive fairness in their organizations, directly influencing:

1. Equitable Compensation

Equitable compensation refers to a reward system that fairly reflects an employee's contributions, considering workload, responsibilities, experience, and skills. The principle of fairness in pay requires that individuals performing similar tasks receive comparable rewards, thereby minimizing favoritism or bias. Perceptions of justice in compensation are not only tied to measurable outputs but also to how employees interpret intent, awareness, and ethical behavior behind reward decisions. When compensation aligns with employee value, trust and commitment to the organization are strengthened.

2. Formal Employee Selection

A transparent and systematic recruitment process is essential in reinforcing fairness in organizations. Formal selection involves assessing candidates based on objective criteria such as qualifications, work history, skills, and personal integrity. Standardized methods like aptitude tests, reference checks, structured interviews, and background verifications are typically employed. By ensuring that hiring decisions are grounded in merit rather than personal bias,

organizations build credibility and foster employee trust.

Merit-Based Promotion

Promotions serve as recognition of employee effort and performance, but they must be based on fairness to have the intended motivational effect. A merit-based promotion system advances individuals based on clear performance metrics, demonstrated competence, and organizational needs, rather than favoritism or informal influence. Fair promotion practices not only enhance morale and job satisfaction but also signal an organization's commitment to equity, which motivates employees to strive for excellence and strengthen overall performance.

Objective Workplace Relations

Workplace relationships that are guided by professionalism and objectivity help minimize personal biases in decision-making. While such interactions may appear detached, they are crucial in maintaining fairness, consistency, and respect for organizational rules. By prioritizing rationality over favoritism, impersonal workplace relations foster procedural justice, safeguard professional boundaries, and reduce the risk of conflicts of interest. Although they may reduce emotional closeness, they ensure decisions are transparent and credible.

The Strategic Importance of Organizational Justice in Modern Organizations

Organizational justice is a vital factor that shapes employee attitudes, performance, and overall organizational effectiveness. Research consistently shows that fairness within organizations generates a series of positive outcomes such as higher satisfaction, stronger commitment, greater readiness for change, and enhanced innovation, while reducing burnout, turnover, and counterproductive work behaviours. The key importance of organizational justice can be outlined as follows:

Enhancing Employee Performance and Productivity

Organizational justice directly influences how well employees perform. When compensation, rewards, and promotion processes are fair and transparent, employees feel valued, which motivates them to work harder. For instance, Artatanaya and Widhari (2023) found that distributive and procedural justice improved employee performance through organizational citizenship behaviours (OCB) and trust. Chandrawaty and Widodo (2021) also revealed that interactional justice, reflected in respectful treatment, was the strongest predictor of performance. Psychological empowerment further mediates this relationship, enabling employees in fair environments to contribute

innovative ideas, support colleagues, and take on extra-role behaviours, thereby boosting overall productivity.

3. Promoting Job Satisfaction and Organizational Commitment

Fairness in decision-making strongly influences employees' emotional connections to their organizations. Evidence shows that organizational justice enhances job satisfaction, which in turn strengthens organizational commitment. Using the job demands-resources (JD-R) model, Yetgin (2024) demonstrated that distributive, procedural, informational, and interactional justice predicted higher identification with the organization, leading to greater commitment and engagement. Similarly, Marso and Anggreyani (2024) found that perceptions of fairness improved job satisfaction and commitment, mediated by psychological capital and quality of working life. When employees trust that processes and outcomes are fair, they invest more emotionally and cognitively, ensuring long-term commitment.

4. Facilitating Organizational Change and Innovation

Resistance to change is common, but perceptions of fairness, particularly in procedural and informational justice, can reduce resistance and promote readiness for change. Kebede and Wang (2022) showed that organizational justice positively shaped employees' willingness to adapt to change in the Ethiopian Revenue and Customs Authority, with perceived organizational support playing a mediating role. Furthermore, organizational justice stimulates innovation by encouraging knowledge sharing and collaboration. Akram and Dong (2019) demonstrated that all dimensions of justice, distributive, procedural, interactional, temporal, and spatial, positively influenced knowledge sharing and innovative behaviours, making fairness a catalyst for creativity and transformation.

5. Reducing Burnout, Turnover, and Counterproductive Behaviours

Unfair treatment in pay, promotions, or workplace interactions often leads to burnout, dissatisfaction, and higher turnover. Ji et al. (2025) revealed that low distributive, procedural, and interactional justice were linked to greater burnout, reduced job satisfaction, and stronger turnover intentions, with procedural justice having the strongest indirect effect. Unfairness also drives counterproductive work behaviours (CWBs) such as incivility or withdrawal. Conversely, perceptions of fairness reduce these behaviours, ensuring workplace stability and safety.

6. Strengthening Trust and Organizational Citizenship

Trust is a critical outcome of justice. When employees believe decision-making is consistent and fair, they are more likely to trust the organization, which encourages

prosocial behaviours such as OCB. Syaifuddin et al. (2023) highlighted a strong link between fairness and OCB, showing that employees treated fairly are more willing to help colleagues, support organizational goals, and engage in extra-role behaviours. In sensitive environments like healthcare, El-Sayad et al. (2014) found that higher organizational justice among physicians and nurses improved performance and service quality, underlining the importance of fairness in professional trust and teamwork.

Aligning Organizational Goals and Labour Relations

Organizational justice also plays a strategic role in labour relations and corporate social responsibility (CSR). By embedding fairness in policies and practices, organizations can align employee and organizational objectives while fostering cooperative relations with labour unions. Jung and Ali (2017) found that distributive and procedural justice enhanced employee attitudes toward CSR, while cooperative labour relations strengthened job satisfaction and commitment. Similarly, Yoon and You (2016) showed that CSR initiatives supported by fair organizational cultures promoted positive labour-management relations in Korean SMEs.

Thus, organizational justice is more than an HR practice; it is a cornerstone of effective management. Rooted in equity and social exchange theories, justice fosters trust, engagement, performance, and innovation while reducing negative outcomes like burnout and turnover. For organizations navigating change and global competition, embedding fairness into structures and culture is not optional but essential. Proactive justice strategies create resilient, engaged, and innovative workforces, leading to sustainable organizational success (Marso & Anggreyani, 2024).

Theoretical Framework

This study was anchored on Organizational Support Theory (OST), developed by Robert Eisenberger and his colleagues in the 1980s through their foundational work on Perceived Organizational Support (POS). OST posits that when employees perceive that their organization values their contributions and cares about their well-being, they respond with stronger commitment and dedication to organizational goals (Eisenberger et al., 1986).

At the heart of the theory is the concept of POS, which reflects employees' general beliefs about how supportive their organization is. When workers feel supported, they are more likely to exhibit loyalty, trust, and increased effort. Conversely, perceptions of neglect or unfair treatment can weaken motivation and lead to withdrawal behaviors (Rhoades & Eisenberger, 2002).

The theory also stresses that support from the organization fulfills employees' socio-emotional needs, such as respect, belonging, and recognition. Meeting these needs fosters psychological attachment, encouraging workers to align their personal goals with those of the organization. In doing so, job satisfaction and performance improve (Shanock & Eisenberger, 2006). Furthermore, OST emphasizes reciprocity; employees who feel supported often go beyond their formal job roles, engaging in discretionary efforts such as organizational citizenship behaviors. Lack of support, on the other hand, can generate stress, dissatisfaction, and higher turnover rates (Kurtessis et al., 2017).

The relevance of OST to this study lies in its connection between fairness and perceptions of support. Acts of justice, such as equitable resource allocation, transparent processes, and respectful interactions to employees that the organization values them. These signals strengthen trust and deepen their sense of belonging, which in turn boosts commitment and engagement.

In today's competitive environment, where innovation, talent retention, and organizational sustainability are vital, OST provides an important lens for understanding why justice is not just an ethical principle but a strategic asset. Fair treatment fosters positive perceptions of support, enhances organizational reputation, reduces turnover, and promotes long-term performance. Thus, OST offers a powerful theoretical framework for highlighting the strategic importance of organizational justice in modern organizations.

Methodology

This study adopted a historical research design, which is appropriate for exploring how the idea of organizational justice has developed over time and why it remains strategically important in today's organizations. The historical approach allows the researchers to trace theoretical shifts, scholarly discussions, and practical applications of organizational justice across different organizational settings. The study relies entirely on secondary sources of data. These include peer-reviewed journal articles, published books, and other credible academic works that address organizational justice. Drawing on secondary sources makes it possible to build on established knowledge and to provide a broad and critical review of how the concept of justice has been understood and applied in organizational studies.

To interpret and make sense of the data collected, content analysis was used as the main method of interpretation. This process involves carefully reviewing, categorizing, and interpreting data from the collected sources to uncover common themes, patterns,

and perspectives. Through this analytical approach, the study brings to light how organizational justice shapes employee commitment, organizational effectiveness, and long-term sustainability, while also showing its continued significance in addressing the challenges of modern workplaces.

Conclusion and Recommendations

This study explored the strategic role of organizational justice and demonstrated how fairness forms the foundation of organizational effectiveness and employee well-being in contemporary workplaces. The historical review revealed that organizational justice has progressed from being seen merely as an ethical or moral concern to becoming a vital strategic requirement for maintaining competitive advantage. By examining its development through the dimensions of distributive, procedural, and interactional justice, the study established that fairness is crucial for building trust, strengthening organizational reputation, and improving overall performance.

The findings show that organizations that intentionally embed fairness into their systems and practices enjoy stronger employee engagement, higher retention rates, and more collaborative workplace cultures. Distributive justice, achieved through the equitable sharing of rewards and resources, directly impacts perceptions of equity and motivation. Procedural justice, which emphasizes transparency and consistency in decision-making, builds trust in leadership and reinforces organizational legitimacy. Interactional justice, centered on respectful treatment and effective communication, strengthens relationships and nurtures a supportive environment. Together, these dimensions create a comprehensive framework for driving organizational success and ensuring long-term sustainability in today's competitive environment.

Theoretically, the study reinforces the value of Organizational Support Theory (OST), which suggests that employees who feel fairly treated and supported by their organizations tend to respond with loyalty, higher commitment, and improved performance. Organizational justice thus serves as both a moral principle and a strategic mechanism for fostering reciprocity, minimizing workplace conflict, and encouraging innovation. By adopting a historical research approach, this study positioned organizational justice within broader discussions of organizational development, highlighting its function as a bridge between employee welfare and organizational objectives.

On the practical side, the findings emphasize that fairness is not simply an admirable value but an essential managerial responsibility. Organizations that overlook justice risk facing disengagement, low morale, and reputational harm. In contrast, those who prioritize

justice in resource allocation, decision-making, and workplace interactions gain long-term benefits such as attracting and retaining talent, promoting collaboration, and adapting more effectively to change. In modern, diverse workplaces where employee expectations are constantly evolving, justice emerges as the cornerstone for creating inclusive, resilient, and high-performing organizations.

In summary, organizational justice should be seen as a strategic pillar of modern management. It extends beyond resolving individual grievances to shaping a collective culture of fairness and respect that drives innovation, strengthens trust, and supports sustainable growth. For organizations aiming to balance performance goals with employee well-being, justice is not optional; it is indispensable. Based on the findings, the following recommendations are proposed:

- i. Organizations should embed fairness into their decision-making by creating clear and transparent policies to guide promotions, reward systems, and disciplinary measures. Doing so will foster trust and minimize perceptions of bias.
- ii. Managers should actively promote a culture of respect and openness by applying principles of interactional justice in everyday activities. This involves treating employees with dignity, offering timely and constructive feedback, and ensuring that communication across the organization is inclusive.
- iii. Policy makers and organizational leaders should align organizational justice with strategic planning by connecting fairness initiatives to broader objectives such as improving employee retention, enhancing organizational reputation, and achieving sustainable performance.

Abstract

This study investigates the influence of entrepreneurial training and innovation drive on sustainable employment outcomes in the non-oil-producing western states of Nigeria. Employing a quantitative research design, primary data were collected through structured questionnaires from 346 entrepreneurs across the targeted regions. The analysis employed descriptive statistics, correlation, and regression techniques. Findings reveal a significant positive relationship between entrepreneurial training and sustainable employment, with a correlation coefficient of 0.816 ($p = 0.001$), underscoring the critical role of targeted skills development in youth employment. Additionally, the innovation drive was identified as a vital factor in job generation and unemployment reduction, with innovation strategies positively influencing employment outcomes. The study is underpinned by human capital theory and innovation diffusion theory, which support the premise that investments in skills and innovative practices enhance enterprise resilience and productivity. The results imply that strategic policy interventions focused on entrepreneurship education and fostering innovation can substantially contribute to reducing unemployment in Nigeria's non-oil economy, thereby promoting sustainable economic growth.

Keywords: *Entrepreneurial training, Innovation drive, Sustainable employment outcome, human capital, Non-oil economy, Nigeria western states.*

Introduction

The catalyst for economic expansion, poverty alleviation, and unemployment eradication is entrepreneurship. The vital role that entrepreneurship plays in sustainable economic growth is highlighted by the Global Entrepreneurship and Development Institute, which provides information on the growth and performance of entrepreneurial ecosystems at the national and provincial levels (Akinwale et al., 2020). Furthermore, Martins et al. (2023) contended that entrepreneurship has a significant effect on the economy by creating sustainable wealth and business prospects. These findings underscore the need for policymakers to foster an environment that encourages innovation and supports new ventures. By investing in education, infrastructure, and access to capital, governments can enhance entrepreneurial activities, ultimately driving economic resilience and social progress.

In this study, entrepreneurship is conceptualized as the process of identifying business opportunities and raising the necessary funds to launch a new enterprise or revitalize an existing one in the face of risks and uncertainties with the goal of turning market or business opportunities into revenue under private ownership. To put it simply, entrepreneurship is the combining of limited resources under private ownership made feasible by innovative, profit-driven ideas and practical actions. The menace of unemployment and its related stigmas has remained a viral affliction of most economies. This persistent issue not only affects individual livelihoods but also hampers overall economic growth and social stability. As communities grapple with high unemployment rates, the stigmas associated with joblessness can lead to feelings of rent-seeking behavior and despair among those affected. According to Ayoade & Agwu (2016), unemployment remains a major challenge of modern economies around the world today; Nigeria is no

exception. Resulting from poor enterprise culture, the unemployment situation in Nigeria is now a major driver of poverty and social vices. Nigeria's unemployment rate has become a multifaceted issue that affects people of various ages, educational levels, and geographic locations. The unemployment issue in Nigeria is indeed hydra-headed, as most critical stakeholders, decision-makers, and governments at all levels are struggling to address the severe challenges brought on by the scourge across diverse economies. In the same vein, it has been posited that unemployment is one of the challenges that confronts every developing nation (economy), which includes but is not limited to Nigeria. The impacts, however, are more visibly present among the teeming young people largely referred to as the youths. This was confirmed by Oviawe (2010). He asserted that more than half of the Nigerian population is under the age bracket of 30; this implies that the nation's economy is driven by its young people (youths). However, this phase of the nation's population is the worst hit by the virus of unemployment. According to Emeh, Nwanguna, & Abaroh (2012), the young folks in Nigeria are largely confronted with the challenges of unemployment and poverty as well as a lack of relevant skills, awareness, and ability required to progress and add value to the economy. Apparently, the difficulties occasioned by unemployment and a dearth of productive capacities make it hard to maintain productive and meaningful lifestyles, which has a detrimental effect on the rate of national development. However, the perceived dearth of productive capacities among the growing Nigerian population, practically in the western non-oil-producing state, could be addressed by entrepreneurial training and innovation initiatives in both the long and short run.

There are torrent of evidence on entrepreneurship's positive propensity to foster economic growth and development in the Nigerian economy. The imperative of most of this literature hosts the fact that entrepreneurship has been discovered to be a prime indicator of economic growth, development, and sustainability; this is practically manifested in developing economies such as Nigeria. Adding credence to the above postulates, Adebayo & Jenny (2013) posited that entrepreneurship drives developing nations' economic advancement and sustainability by means of job creation and unemployment diminution. However, Arogundade (2011), cited in Ayoade & Agwu (2016), affirmed the contributory role of entrepreneurial initiative to employment provision but ventilated that entrepreneurship, which would have saved the Nigerian economy from unemployment woes, is not receiving desired support from various levels of government. Recognizing the efficacy of entrepreneurial ventures in job creation, most Nigerians,

especially the youth, have embraced it to carve a niche for themselves in the economy. This corroborates the submissions of Oni & Daniya (2012). The duo posited that Nigerians without jobs have turned to self-help and starting their own enterprises as a way to support themselves. This further stresses the positive nexus of entrepreneurship with job generation. Tijani-Alawiye (2004) emphasizes that entrepreneurship boosts the supply of the host of industrialists, and the upshots in the files of industrialists could result in the manner of SMEs or large-form enterprises, which are present in the economy and should be strong, innovative, and have the push to nurture the diverse businesses so as to develop and realize socio-economic development goals in an economy. Adenutsi (2023) contends that in low-income economies, entrepreneurship is the engine of economic growth and development by reducing poverty, creating jobs, and empowering people.

Entrepreneurial training and innovation initiatives are two strategic hubs for unemployment diminution in developed, developing, and less developed economies. This corroborates the view of Mitra (2011), cited in Gamede & Uleanya (2019), who posited that the value-adding potentials (contribution) of entrepreneurship to economic growth and development are a result of or stem from knowledge acquisition as well as entrepreneurial training. In essence, in both developed and developing economies, education is viewed as an investment that promotes growth. This demonstrates that when nations work to expand their training systems to support the development of entrepreneurship abilities, they will be able to accelerate their economic development and lessen the rate of unemployment (Abari, Mohammed & Olufemi, 2016). In addition to adding value to the nation's economic growth and development, entrepreneurship training and innovation initiatives are drivers of employment generation via the provision of skills and mindsets essential to generate and sustain businesses, while innovation drives productivity and competitiveness.

Nigeria, a country historically reliant on oil revenues, is grappling with high youth unemployment and regional disparities in economic performance. Particularly in non-oil-producing southwestern states, such as Osun, Ekiti, and Ogun, employment challenges persist despite significant entrepreneurial potential. As global economies pivot toward innovation-driven employment, understanding how entrepreneurial training and innovation drive sustainable employment outcomes becomes critical. This study explores the extent to which entrepreneurial training and innovation drive—two pillars of the human capital and innovation systems theories—can foster sustainable employment in these under-resourced, non-oil-producing regions.

Objective of the Study

This research is powered by the following objectives:

- a. **General Objective:** To investigate the nexus between entrepreneurial training and diminution of unemployment in Non-Oil Producing western States of Nigeria.
- b. **Specific Objectives:**
 - (i) To determine the correlation between ET and diminution of unemployment in Non-Oil Producing western States of Nigeria.
 - (ii) To find out whether innovation drive contribute to diminution of unemployment in Non-Oil Producing western States of Nigeria.

Hypotheses of the Study

The pursuit and achievement of the stated objectives of the study is guided by the postulated hypotheses below:

Hypothesis 1

H_0 : There exists no positive and significant nexus between ET and diminution of unemployment in non-oil-producing western states of Nigeria.

H_1 : There exists a positive and significant nexus between ET and diminution of unemployment in non-oil-producing western states of Nigeria.

Hypothesis 11

H_0 : There is no positive and significant correlation between innovation drive and diminution of unemployment in non-oil-producing western states of Nigeria.

H_0 : There is positive and significant correlation between innovation drive and diminution of unemployment in non-oil-producing western states of Nigeria.

Research Questions

The following questions were stated to provide a lucid guidance for the research.

To what extent does ET influence/contribute to diminution of unemployment in non-oil-producing western states of Nigeria?

Does innovation drive contribute to diminution of unemployment in non-oil-producing western states of Nigeria?

Review of Related Literature and Conceptual Clarification

Source: Author's Conceptualization, 2025.

Entrepreneurial Training and Sustainable Employment Outcomes

Studies have indicated that individuals who are actively involved in skill- and perspicacity-based training usually demonstrate or exhibit higher and better entrepreneurial potential and intentions and are very likely to start and manage their enterprises more effectively and efficiently (Neck & Corbett, 2018). This suggests that fostering these skills in educational and professional settings could significantly enhance the entrepreneurial landscape. By prioritizing such training, we may empower a new generation of innovators and business leaders.

Entrepreneurial training, which other scholars refer to as entrepreneurial education, is skills- and perspicacity-driven; hence, it becomes positively effectuous for participants who sincerely embrace and key into it. In a broader facet, it's shaded as a "capacity" building initiative that liberates individuals or groups of individuals from intellectual and skills debt burdens in developing economies such as Nigeria and other developing nations. These foster a sense of competence and ability that enables participants to be self-reliant and job creators, thereby resulting in unemployment diminution. Entrepreneurial training cuts across the acquisition of business cutting-edge skills, resourceful information, opportunity identification, financial literacy, and risk management. According to Fayolle and Gailly (2015), such training enhances entrepreneurial intention and capacity. In contexts with limited formal employment, these skills are indispensable for job creation. They asserted that these training exercises improve participants' problem-solving, leadership, and decision-making abilities by bridging the gap between academic understanding and actual business difficulties (Rideout & Gray, 2019). According to research, students who participate in experiential learning exhibit better risk-taking skills, more entrepreneurial intents, and increased confidence when starting their own companies (Fayolle & Gailly, 2015).

Innovation Drive and Sustainable Employment Outcome

Innovation drive refers to the capacity and motivation to adopt new ideas, technologies, or processes. Drucker (1985) argues that innovation is the specific instrument of entrepreneurship. In sub-Saharan Africa, innovation has been shown to mediate the impact of training on business scalability and job-wealth creation (Akinwale, 2018). This suggests that fostering innovative practices can significantly enhance the effectiveness of training programs, ultimately leading to more robust economic growth in the region. Apparently, innovation involves more than just introducing new services or products in the business environment; it largely encompasses

embracing or adopting innovative enterprise strategies (models), approaches, and collaborations that support sustainable performance and growth. Enterprises that integrate and incorporate sustainability firmly into their innovation practices are more likely to excel, generate outstanding and better financial results (performance), and add to an environment and society that are healthier and more responsive to emerging trends. By prioritizing innovation, businesses can adapt more readily to market demands and expand their operations. Adding credence to innovation's sterling attributes for driving sustainable growth, Onsel (2015) posits that innovation is not just more closely associated with problem-solving but instead typically related to improving competitiveness and economic success, and it is frequently spurred by technology. This correlation existing between innovation and technology highlights the significance of promoting an environment that promotes creative experimentation and thinking. By investing in research and development, enterprises can improve their skill power and align themselves favorably in an ever-evolving market environment. Nambisan (2015) asserts that the effect of innovation is so significant that a plan or strategy can be evaluated based on how it directs and affects the innovation activities of the firm. This perspective emphasizes the importance of aligning organizational goals with innovative practices to foster growth and adaptability. By doing so, companies can better navigate market changes and enhance their competitive edge.

Innovation is seen as a crucial component of business success. According to Harper and Becker (2013), innovation led to a substantial advance in the actual product, process, or service-preferably one that outperformed the impact of earlier successes. These writers also suggested that innovation promoted sustainable corporate management.

Sustainable Employment Outcome

In the context of this study, sustainable employment is characterized as, or it simply means, sustainable job or employment creation that addresses the economic and financial yearnings of ateaming populace. It is a job or employment that is created by an individual or group of individuals from empowerments (such as skills training, innovation, and other initiatives) that can stand the test of time with a financial and economic dropdown menu to better the lot of the holder of such job(s). It is a sign of economic and financial fulfillment and independence on the part of such an entrepreneur or enterprise administrator. In a nutshell, this form of job creation (employment) not only aids or betters the lot of the individual but also greatly contributes to the society and economy in general. By encouraging or fostering a climate where skills and innovation thrive, we can pave the way for long-lasting job opportunities

that enhance overall well-being. The following criteria are used to define sustainable employment outcomes (SEO): (i) employment quantity (net job creation/retention); (ii) employment quality (earnings above local living-wage benchmarks, formal contracts, social protection); (iii) skills development and progression pathways; and (iv) inclusivity (youth/women participation). This acknowledges the reality of SMEs while adhering to the principles of decent labor. According to Deeya & Ojha (2025), sustainability employment is the ability of the employee to provide added value for an organization now and in the years to come (future), while also experiencing added value themselves. Van, Karen, Vuuren & Kemps (2017) see sustainable employment as the extent to which employees are able and willing to stay in work over time. Kellard et al. (2001) & Lengnick-Hall, Gaunt & Kulkarni (2008), cited in Aksnes & Ulstein (2023), posit that several aspects related to individual work ability and attributes, employers' attitudes and practices, and labor market characteristics can influence sustainable employment.

Theoretical underpinnings

The underpinning theories of the study are the human capital theory (HCT) and innovation diffusion theory (IDT). The study incorporates HCT advanced by Becker (1964) and the IDT proposed by Rogers (2003). The underpinning and relevance of these models to this present study is premised on the ground that human capital investments (training) are found to have a positive correlation with improved productivity, agility, and performance versatility, while innovation diffusion facilitates adaptability, flexibility, and competitiveness. These combined models advance that enterprises that give priority attention to employee skills and competence building and embrace innovative cultures (practices) are more likely to excel, respond quickly, and thrive in changing (dynamic) markets. This comprehensive approach not only improves individual effectiveness but also cultivates a culture of ongoing improvement and adaptability. Businesses are therefore more equipped to handle obstacles and take advantage of possibilities in quickly evolving settings. By encouraging a skilled and informed workforce and fostering a notion of innovation, enterprises can position themselves strategically for sustainable progress, growth, and long-term success.

Methods

This study was designed to assess the contributions of ET and ID to unemployment reduction in selected non-oil-producing western states in Nigeria. That is, to determine whether the above constructs assist in combating the menace of unemployment. To realize this goal, the paper adopted the survey research design.

The design was used owing to the fact that the research revolves around the impression and is targeted at gathering information from selected entrepreneurs of non-oil-producing western states in Nigeria. The description of non-oil-producing states connotes states that have no oil deposits; this also includes states that have no current oil mineral exploration activities taking place in their coverings, and therefore they are not major contributors to Nigeria's crude oil output, such as Lagos, Ogun, Oyo, Osun, and Ekiti. The rationale underpinning the selection of these non-oil-producing states hinges on the notion that youths from the oil-producing states are more concentrated on oil and oil-related dealings, thereby neglecting entrepreneurial ventures. Hence, entrepreneurial activities seem not to thrive well compared to the non-oil-producing actors (states). This disparity suggests that there is a significant opportunity for youth in the non-oil-producing states to engage in diverse economic activities. By fostering entrepreneurial spirit and innovation, these regions could potentially enhance their economic resilience and contribute more substantially to Nigeria's overall development. The population of the study comprised all entrepreneurs in western non-oil-producing states in Nigeria. To arrive at a reliable sample frame, the study applied a non-probabilistic sampling model; thereafter, a purposive sample of 367 entrepreneurs was selected and used for the study. Selected entrepreneurs include both males and females of different enterprise outfits, races, tribes, ages, and educational profiles. The different categories of criteria adopted were apt, as they assisted in generating non-biased responses for ascertaining the influence of ET and ID on unemployment reduction in Nigeria. The study relied on primary data; therefore, a structured and cross-examined questionnaire complemented by in-depth interviews constituted the tools for data gathering. The instrument yielded a Cronbach alpha of 0.8401, a value above the 0.70 threshold, therefore indicating that the instrument is internally consistent and reliable. Both descriptive and inferential statistics were used for data examination. Here, the DS was adopted as a metric of central tendency and variability scrutiny. The DS is composed of mean, standard deviation, minimum, and maximum values. While the inferential statistics took care of the correlational statistical scrutiny. SPSS and STATA were used for descriptive and postulated hypotheses scrutiny.

Model Specification

The study's composite model specification, which shows the functional relationship between the independent and dependent variables, is provided below.

Unemployment Diminution=

f(Entrepreneurship training and Innovation drive).
eq. 1

The following models were later specified in order to successfully test the hypotheses that were proposed for the study:

Model 1

$$\begin{aligned} \text{UempD} &= f(\text{EntT}) \\ \text{UempD} &= \alpha_0 + \beta_1 \text{EntT} + \epsilon_t \end{aligned} \quad \begin{array}{l} \text{eq.2} \\ \text{eq.3} \end{array}$$

Model 2

$$\begin{aligned} \text{UempD} &= f(\text{InD}) \\ \text{UempD} &= \alpha_0 + \beta_1 \text{InD} + \epsilon_t \end{aligned} \quad \begin{array}{l} \text{eq.4} \\ \text{eq.5} \end{array}$$

This model is predicated on the idea that innovation and entrepreneurship training in Nigeria's western non-oil-producing states directly contribute to the decline in unemployment.

Variable Descriptions

UempD = Unemployment Diminution
EntT = Entrepreneurship training
InD = Innovation drive
 α_0, β_1 = Regression coefficients of the model
 ϵ_t = Error term.

Demographic profiles of respondents

Table 1: Respondents sex profile

Sex	Frequency	Percentage (%)
Male	208	60.1
Female	138	39.9
Total	346	100%

Source: SPSS Output 2025.

Figure 1: Pie Chart depicting the Sex profiles of sampled respondents.

Table 1 and figure 1 above present a copious profiles of studied respondents. From information contained therein, there are more male respondents (208), accounting for 60.1% than their female counterpart (138) representing 39.9%. The implication of this

statistics is that, there are more male entrepreneurs in the Western Nigeria non-oil producing states. This suggests that male individuals dominate the respondent group, indicating possible gender dynamics in the informal business sector surveyed/studied.

Table 2: Marital Profile of Respondents

Marital Status	Frequency	Percentage (%)
Married	267	77.2
Single	63	18.2

Marital Status Frequency Percentage (%)		
Others	16	4.6
Total	346	100%

Source: SPSS Output 2025.

Figure 11: Pie Chart indicating the marital dispositions of studied respondents.

It is evident from the above statistics ably conveyed by table 2 and figure 2 that majority of the surveyed respondents (267) representing 77.2% are married, and closely followed by 18.2% single and 4.6% in other

categories, indicating a mature, civilized, and possibly stable business demographic. This could reflect a level of life stability that correlates with longer-term enterprise commitment and engagement.

Table 3: Respondents Age Profile

Age Group Frequency Percentage (%)		
26–35	179	51.7
15–25	68	19.7
36–45	51	14.7
46–55	28	8.1
56+	20	5.8
Total	346	100%

Source: SPSS Output 2025.

Figure 111: Pie Chart indicating the age status of investigated respondents.

The statistics displayed in table/figure 111, showed that more than half of the studied respondents (179) accounting for about 51.7% of the total population, are within the 26–35 age bracket/group, indicating an agile, young, and active/vibrant business enterprise

population. Thereby indicating them as the most economically active age range. This implies that the entrepreneurial landscape of western Nigeria non-oil producing states are largely youth/ young people dominated.

Table 4: Years in Business/Work Experience

Years in Business	Frequency	Percentage (%)
16–25	134	38.7
6–15	88	25.4
1–5	68	19.7
26–35	38	11.0
36+	18	5.2
Total	346	100%

Source: SPSS Output 2025.

Figure 1V: Pie Chart representing sampled respondents' work experience/years in business

Apparently, the statistical information disclosed in table/figure IV indicated that vast numbers of respondents, representing 38.7% of the outright sampled audience, have been in practice of business for between 16 and 25 years. This is closely followed by those that have been in the practice of enterprises for 6-15 years, representing 25.4%. On the other hand, it was equally ascertained that a very few and limited number have been in the practice and organization of business

ventures for a period of over 36 years, accounting for a paltry 5.2% of the given population. A cursory gaze at the above statistics suggested that experienced enterprise managers and owners dominate the population of entrepreneurs in Nigeria's western non-oil-producing states. This indicates a developed and expanding business environment necessary for a nation-building.

Table 5: Educational Profile of Respondents

Education	Frequency	Percentage (%)
OND/NCE	181	52.3
FSLC/SSCE	74	21.4
BSc/HND	57	16.5
MSc/Others	34	9.8
Total	346	100%

Source: SPSS Output 2025.

Table/figure V presents the educational dispositions of respondents of this study. The statistics established that a significant facet number, or vast majority of respondents, reflecting 52.3% of the study's given population, possessed the ordinary national diploma and national certificate for education (OND/NCE) qualifications. This is immediately succeeded by 21.4% accounting for respondents with a first school leaving certificate and senior school certificate examination (FSLC/SSCE). These results largely established the overall education/academic level of the enterprise/business environment studied, copiously

showing that the entrepreneurship landscape of the non-oil-producing western state of Nigeria is moderately schooled and educated, with a very minimal/smaller number holding higher education (university) degrees. It can be deduced from this result that the vast majority of higher education degree/certificate holders in the surveyed environment may not show interest in exploring the economic creams of the informal sector, thereby giving the impression that they're either seeking white-collar jobs or embracing the jakpa syndrome, which may be detrimental to overall nation-building.

Table 6: Descriptive Statistics of Entrepreneurial Training and Sustainable Employment Outcomes

Stats.	q1	q2	q3	q4	q5	q6
Mean	4.38	4.32	4.282341	4.23	4.53	4.461208
Std.Dev	.6654743	.7213733	.7675819	.8322119	.7833619	.7723765
Max	6	6	6	6	6	6
Min	1	1	1	1	1	1

Source: Field Survey, 2025

It is indicated from table 6 above that item 5 accounts for the highest mean score (mean = 4.53), closely followed by item 6 (4.46), while item 7 has the lowest mean score (4.23). Generally, in overall terms, it can be adduced that all items (1, 2, 3, 4, 5, and 6) beat the benchmark or mean threshold of 2.50 rating outcomes. That is, items 1, 2, 3, 4, 5, and 6 have their respective mean scores within the range of 2.50-4.53. The above result establishes that entrepreneurial training is a critical factor that contributes and can be used to drive

sustainable employment outcomes. This further establishes copiously that ET is a contributory variable for unemployment diminution in the non-oil-producing western states of Nigeria. This suggests that enhancing entrepreneurial skills through targeted training programs can significantly reduce unemployment rates in these regions. Consequently, policymakers should prioritize the implementation of such training initiatives to foster economic growth and job creation in the non-oil-producing western states of Nigeria.

Table 7: Descriptive Statistics of Innovation drive and Sustainable Employment Outcomes

Stats.	Q7	Q8	Q9	Q10	Q11	Q12
Mean	4.443217	4.337709	4.38	4.21	4.51	4.490151
Std.Dev	.6162832	.6531375	.6285843	.7341154	.7439628	.6741643
Max	6	6	6	6	6	6
Min	1	1	1	1	1	1

Source: Field Survey, 2025

It can be observed from table 7 above that item 11 generated the highest mean score (4.51) and was immediately succeeded by item 12, which churned out a mean score of 4.49, while item 10 generated the lowest mean score (4.21). Without mincing words, in overall perspective, it can be asserted that all items (7, 8, 9, 10, 11, and 12) perform above the suggested mean score threshold of 2.50. That is, items 7, 8, 9, 10, 11, and 12 have their respective mean scores within the range of 2.50-4.53. The outcome of this analysis indicated that innovation drives results in employment generation and unemployment diminution. The findings suggest that fostering innovation can play a

crucial role in creating job opportunities and reducing unemployment rates. Therefore, policymakers and business leaders should prioritize innovative strategies to enhance economic growth and workforce development.

Testing of Hypotheses and Discussions

The sterling target of the study was to empirical ground truth the Influence of Entrepreneurial Training and Innovation drive on sustainable employment outcomes. That is, whether these two constructs or proxies contributes to unemployment diminution in Nigeria. To achieve the aforementioned, the following hypotheses were postulated and tested.

Hypothesis 1

Null: There exists no positive and significant nexus between ET and diminution of unemployment in non-oil-producing western states of Nigeria.

Alternative: There exists a positive and significant nexus between ET and diminution of unemployment in non-oil-producing western states of Nigeria

Table 8: Correlation of Entrepreneurial Training and Sustainable Employment Outcomes

	Variables		Entrepreneurial Training	Sustainable Employment Outcomes
Spearman's rho	Entrepreneurial Training	Correlation Coeff...	1	.816**
		Sig. (2-tailed)		.001
	Sustainable Employment Outcomes	N	346	346
		Correlation Coeff...	.816**	1
		Sig. (2-tailed)	.000	
		N	346	346

***Correlation is significant at the 0.05 level (2-tailed) **

Table 8 established copiously that there exists a positive and significant nexus between Entrepreneurial Training and Sustainable Employment Outcomes ($r = 0.816$, $n = 346$, $p = 0.001$). This finding underscores the importance of providing comprehensive entrepreneurial training programs, as they can lead to improved job security and career advancement

opportunities for participants (entrepreneurs) via technical, adoptive, and ICT skills. These aptitudes enable them create and manage their own enterprises effectively. As a result, investing in such training initiatives could be a crucial strategy for enhancing overall employment sustainability in the area. In a nutshell, ET has a positive contribution to

unemployment diminution. Nonetheless, given that correlation does not equate to causation, a straightforward/simple regression analysis was

employed to assess the influence of ET on sustainable employment outcomes within the non-oil-producing western states of Nigeria

Table 9 Summary of a Simple Regression Analysis of Entrepreneurial Training and Sustainable Employment Outcomes

	R Square	Adjusted R ²	Coefficient	F-stat	F-sig.	T-stat	t-sig.	D.W
Sustainable Employment Outcomes	.587	.497	.446	19.770	.000 ^b	4.703	.000	1.947

Source: SPSS Output, 2025

Table 9 demonstrated that the coefficient of determination, or R-squared value, for the impact of ET on sustainable employment outcomes was .587. This figure indicates that ET contributes to or explains a 58.7% growth in sustainable employment outcomes (SEO) at the non-oil-producing western states (NOPWS) of Nigeria. Other factors not covered by the model account for the remaining 41.3% of the causes of employment generation at NOPWS of Nigeria. After adjusting for the degree of freedom, the coefficient of determination came out to be .497, or roughly 49.7%. This indicated that ET accounts for approximately 49.7% of systematic variation in SEO after adjustment to degrees of freedom. The regression analysis's Durbin-Watson score of 1.947 indicates that serial autocorrelation is absent, and the model can be relied on/trusted to inform policy decisions pertaining to the subject matter. The results of the regressions showed that, on average, there are statistically significant linear

relationships between ET and SEO at the NOPWS of Nigeria, according to the F-statistic test of 19.770 at prob (Sig) = .000b performed at the 5% level of significance. Likewise, the SEO model's t-statistics of 4.703 at a p-value (sig) of 0.000, which is below the 5% level of significance, showed a significant correlation/nexus between SEO and ET at the NOPWS of Nigeria. This further established that the NOPWS of Nigeria will witness a 44.6% growth in SEOs for every 1% increase/improvement in ET, according to the coefficient of .446.

Hypothesis 11

Null: There is no positive and significant correlation between innovation drive and diminution of unemployment in non-oil-producing western states of Nigeria

Alternative: There is a positive and significant correlation between innovation drive and diminution of unemployment in non-oil-producing western states of Nigeria

Table 10: Correlation of Innovation Drive and Sustainable Employment Outcomes

	Variables		Innovation Drive	Sustainable Employment Outcomes
Spearman's rho	Innovation Drive	Correlation Coeff...	1	.816**
		Sig. (2-tailed)		.000
		N	346	346
	Sustainable Employment Outcomes	Correlation Coeff...	.814**	1
		Sig. (2-tailed)	.000	
		N	346	346

***Correlation is significant at the 0.05 level (2-tailed) **

Table 10 revealed that there exists a positive and significant correlation between innovation drive and SEO ($r = 0.814$, $n = 346$, $p = 0.000$). This result implies that regions or enterprises that prioritize a strong focus/attention on innovation have a high propensity to experience improved efficiency in search engine optimization and economic boom as well. Therefore, cultivating/fostering an innovative culture and enabling avenues could be key tactics or crucial strategies for improving the impact of innovation and digital skills on entrepreneurial development and, by extension, enhanced dependable job and wealth creation. As such,

investing in such an initiative could be a veritable tool for improving overall employment generation and sustainability in these Nigerian western states. Therefore, innovation drive has a positive impact on unemployment diminution. However, owing to the grounds that correlation does not apparently translate to causation, a simple regression analysis was therefore used to evaluate the impact of innovation drive on sustainable employment outcomes within the non-oil-producing western states of Nigeria using the metrics of R² and adjusted R²

Table 11: Summary of a Simple Regression Analysis of Innovation Drive and Sustainable Employment Outcomes

	R Square	Adjusted R^2	Coefficient	F-stat	F-sig.	T-stat	t-sig.	D.W
Sustainable Employment Outcomes	.472	.469	.531	19.671	.000 ^b	4.667	.000	1.839

Source: SPSS Output, 2025

The influence of ID on sustainable employment outcomes was shown to have a coefficient of determination (R-squared value) of .472 in Table 11. According to this data, ID is responsible for or explains a 47.2% increase in sustainable employment outcomes (SEO) in Nigeria's non-oil-producing western states (NOPWS). The remaining 52.8% of the reasons of employment creation at NOPWS of Nigeria are due to other factors that are not included in the model. When the degree of freedom was taken into account, the coefficient of determination was .469, or about 46.9%. This showed that, after adjusting for degrees of freedom, ET explains roughly 46.9% of the systematic variation in SEO. The model may be trusted to influence policy decisions related to the topic because serial autocorrelation is absent, as indicated by the regression analysis's Durbin-Watson score of 1.839. The F-statistic test of 19.671 at prob (Sig) = .001b, conducted at the 5% level of significance, indicated that, on average, there are statistically significant linear correlations between ID and SEO at the NOPWS of Nigeria. Similarly, a significant correlation or relationship between SEO and ID at the NOPWS of Nigeria was demonstrated by the SEO model's t-statistics of 4.667 at a p-value (sig) of 0.000, which is below the 5% level of significance. This further established that the NOPWS of Nigeria will witness a 53.1% growth in SEOs for every 1% increase/improvement in ET, according to the coefficient of .531.

Discussion of Findings

The findings of this research confirm that entrepreneurial training has a significant and positive impact on sustainable employment outcomes in Nigeria's non-oil-producing western states. The high correlation coefficient suggests that well-structured entrepreneurship programs can effectively enhance participants' capacity to establish and manage enterprises, leading to job creation and reduced unemployment. These results align with existing literature emphasizing the importance of skills development in fostering entrepreneurial activity and employment, particularly in regions less reliant on oil revenues. Furthermore, the study establishes that innovation acts as a catalyst for employment by encouraging new business models, improving productivity, and addressing regional economic disparities. The innovation drive was shown to be a

significant predictor of employment expansion, reinforcing the importance of fostering an innovative culture in entrepreneurial ecosystems. The demographic profile indicating a predominantly educated but moderately schooled population suggests opportunities and challenges; while education lays a foundation, targeted entrepreneurship training is vital in translating knowledge into productive activities. The regional focus on non-oil states, which tend to lag behind oil-producing regions in employment, highlights the potential for growth through strategic capacity-building initiatives. These findings support the applicability of human capital theory-investing in skills enhances productivity-and the diffusion of innovation framework-adopting innovative practices sustains competitive advantage and job creation. Overall, the research underscores that concerted efforts in entrepreneurial education and innovation can significantly mitigate unemployment challenges.

Conclusion and Recommendations

This study concludes that both entrepreneurial training and innovation drive substantially contribute to reducing unemployment and promoting sustainable employment in Nigeria's non-oil-producing western states. The strong positive relationships underscore the necessity for policymakers and stakeholders to prioritize capacity-building initiatives that enhance entrepreneurial competencies and foster innovative business practices. Addressing the regional employment deficit through these interventions can accelerate economic diversification, resilience, and inclusive growth. The following recommendations therefore, were suggested: To effectively reduce unemployment and promote sustainable economic growth in Nigeria's non-oil regions, it is essential for policymakers to develop and implement comprehensive policies that support entrepreneurial training and innovation, ensuring these programs are relevant and accessible. Enhancing curricula to include ICT and technical skills, fostering innovation hubs and access to finance, and integrating entrepreneurial education at all levels are crucial steps. Additionally, encouraging partnerships among government, academia, and the private sector, coupled with establishing robust monitoring and evaluation systems, will ensure continuous improvement, scalability, and sustainability of these initiatives. Collectively, these strategies will strengthen the entrepreneurial ecosystem and drive long-term employment and economic

resilience. Implementing these recommendations could significantly enhance the entrepreneurial ecosystem in Nigeria's non-oil regions, leading to meaningful reductions in unemployment and fostering sustainable economic development.

Abstract

This study examined the influence of organizational silence and organizational justice on employee performance in educational institutions in Edo State. The primary objective was to determine the extent to which organizational silence and justice predict employee performance. A quantitative research design was adopted, utilizing a structured questionnaire to collect data from employees in selected educational institutions. Multiple regression analysis was employed to analyze the relationship between the independent variables organizational silence (OS) and organizational justice (OJ) and the dependent variable, employee performance (EP). The results showed that organizational justice had a statistically significant and positive effect on employee performance ($B = 0.321$, $\beta = 0.539$, $p = 0.000$), indicating that fairness in decision-making, equitable treatment, and transparency significantly enhance employee loyalty and dedication. Conversely, organizational silence (OS) exhibited a positive but statistically insignificant relationship with employee performance (EP), ($B = 0.106$, $\beta = 0.119$, $p = 0.343$), suggesting that perceived support from management alone may not be sufficient to drive employee performance in public settings. The study concludes that organizational justice is a critical driver of employee performance more so than general organizational support. It recommends that public sector managers prioritize transparent and fair organizational practices, train leaders in equitable interpersonal relations, and re-evaluate existing support systems to ensure they are genuinely responsive to employees' needs. These efforts are essential for cultivating a committed and motivated workforce in educational institutions.

Keywords: *Organizational Silence, Employee Performance, Educational Institutions, Regression Analysis, Descriptive statistics*

Introduction

Organizations increasingly recognize that employees are not just resources but vital agents whose attitudes, voice, and behaviour determine service quality, innovation, and overall institutional success. In educational settings particularly, employee performance is not only reflected in teaching and administrative efficiency, but also in how willing staff are to share ideas, feedback, and concerns. When they do not, a phenomenon known as organizational silence emerges, with serious consequences for organizational effectiveness. (Dhaqane, 2024). Organizational silence

refers to the deliberate withholding by employees of suggestions, concerns, or knowledge about work-related issues. Recent studies show that high levels of silence negatively affect decision making, slow innovation, and reduce employee engagement, leading to poorer performance outcomes. For example, a 2024 study in universities in Mogadishu found that employee voice, fear of retaliation, and communication climate are all significantly related to organizational performance (Dehkharghani, Paul, Maharati & Menzies, 2023). Meanwhile, a literature review by Dehkharghani (2023) highlights that employee silence is

multi-dimensional and consistently associated with negative organizational outcomes (Okafor, Ijemba, & Okolo-Obasi, 2025). In tandem, organizational justice employees' perceptions of fairness in decision-making procedures (procedural justice), resource allocation (distributive justice), and interpersonal treatment (interactional justice) has been shown to influence many outcomes including job satisfaction, loyalty, trust, and performance. A recent study in Southeast Nigeria among deposit money banks demonstrated a strong positive relationship between organizational justice and employee performance (measured in terms of morale, participation, retention) (Goodfaith, Dike, Anetoh, & Eboh, 2021). Also, research in government-owned polytechnics in Anambra State (2021) confirmed that procedural, distributive, and interactional justice each have significant effects on employee performance (Goodfaith, Dike, Anetoh, & Eboh, 2021).

Despite the importance of both constructs, relatively few studies have jointly examined the effects of organizational silence and organizational justice on employee performance in educational institutions, especially in Nigerian contexts like Edo State. Furthermore, the mechanisms through which silence and justice interact does justice reduce silence? Does silence moderate the justice-performance link? under-explored in recent work.

Statement of the Problem

Employee performance is pivotal for the success and growth of educational institutions. However, organizational silence, characterized by employees withholding ideas, feedback, and constructive criticism, undermines decision-making, innovation, and overall productivity. Similarly, perceived organizational injustice can erode trust, dampen motivation, and discourage employee engagement. Despite the recognized importance of addressing both silence and justice in the workplace, there is insufficient empirical evidence on their combined effects on employee performance, particularly within educational institutions. This study aims to fill this gap.

The main objective of this study is to examine the effect of organizational silence on employee performance in educational in selected educational institutions in Edo State. The study also aimed to examine the effect of organizational justice on employee performance in educational in selected educational institutions in Edo State.

The following hypothesis were formulated to guide the study:

H₀₁: Organizational silence has no significant effect on employee performance in selected educational institutions in Edo State

H₀₂: Organizational justice has no significant effect on employee performance in selected educational institutions in Edo State.

REVIEW OF RELATED LITERATURE

Conceptual Framework

Concept of Organizational Silence

Organizational silence, once loosely equated with loyalty and the absence of voiced concerns, has evolved into a critical concept recognized as detrimental to organizational effectiveness. Earlier perspectives interpreted silence as indicative of harmony or the absence of problems, but contemporary research demonstrates that a climate of silence can hinder organizational success and innovation. Organizational silence is now understood as a collective phenomenon where employees deliberately withhold ideas, opinions, concerns, or information about organizational issues (Güvenç, 2025). Tekin (2024) initially defined silence not merely as an absence of voice but as a complex form of communication involving a spectrum of cognitions and emotions such as objection or endorsement, with motives behind silence varying from fear to resignation. This has been refined by recent studies emphasizing that employee silence manifests in multiple forms accepting/passive silence, defensive silence, and silence for perceived organizational benefit each with different implications for organizational dynamics (Ozan&Yolcu, 2024).

Within educational institutions, organizational silence is particularly impactful. Silence among teachers and staff can arise from fear of reprisal, lack of trust, cultural power distance, and perceptions of organizational injustice, leading to reduced participation in decision-making and innovation (Al-Omari, Al-Nashwan& Ahmed, 2022). This silent behaviour undermines educational goals by limiting the flow of valuable feedback and critical information necessary for school development, employee motivation, and effective adaptation to change (Girgin, 2020; Göven & Şentürk, 2020).

Employees, especially in educational settings, often face the dilemma of whether to voice their observations and concerns or withhold them, knowingly or unknowingly. This withholding of information, or employee silence, diminishes organizational knowledge sharing and hampers performance outcomes. Importantly, the motivation behind silence—whether driven by fear, apathy, or strategic calculation is essential in understanding its consequences (Özkan, 2022).

Organizational silence acts as a barrier to organizational justice perceptions and employee engagement, thereby negatively influencing employee performance, particularly in institutions where open

communication is critical. To counter the effects of silent behaviour, fostering an inclusive communication climate and encouraging employee voice are vital to enhance overall organizational performance and commitment (Kose, 2020; Dehkharghani, 2023). Organizational silence is a nuanced and complex phenomenon characterized by collective employee withholding of information and perspectives that are valuable to organizational decision-making and growth. In educational institutions, addressing the roots and effects of organizational silence is crucial to improving employee performance and achieving institutional goals through enhanced organizational justice and open dialogue.

Concept of Organizational Justice

Organizational justice refers to employees' perceptions of fairness within an organization and its influence on their attitudes and behaviours. It is primarily conceptualized through three core dimensions: distributive justice, procedural justice, and interactional justice (Kuuyelleh, 2025). Distributive justice concerns the perceived fairness in the allocation of outcomes such as pay, promotions, and workload. When employees believe resources are distributed equitably based on effort and contribution, they exhibit higher job satisfaction and organizational commitment (Zhang, 2024). Procedural justice involves the fairness of the processes used to make decisions and allocate resources. Transparent, consistent, and unbiased procedures enhance employees' trust in organizational systems, regardless of the outcome (Danjuma, Wakkala&Zagga, 2025). Interactional justice focuses on the quality of interpersonal treatment employees receive during the execution of procedures, emphasizing respect, honesty, and adequate communication by supervisors (Christianah & Olufunmilola, 2023).

In educational institutions, organizational justice is particularly relevant as fairness in promotions, workload distribution, and communication significantly shape employee motivation and performance. Recent empirical studies indicate that academic and non-academic staff perceiving higher organizational justice demonstrate increased productivity, commitment, and job satisfaction (Kuuyelleh, 2025). Perceived fairness fosters a positive work environment characterized by higher engagement and reduced intentions to leave, which is crucial for sustaining institutional effectiveness (Caminos, 2025; Zhang, 2024). Moreover, organizational justice plays a vital role in employee trust in leadership and willingness to invest discretionary effort. Conversely, perceptions of injustice correlate with negative outcomes such as low morale, absenteeism, and decreased individual and collective performance (Dehkharghani, 2023). These

effects are especially pronounced in educational settings where organizational justice builds not only employee motivation but also supports institutional goals through enhanced cooperation and engagement (Okolocha et al., 2021). Thus, organizational justice is a multidimensional concept encompassing distributive, procedural, and interactional fairness, each significantly influencing employee attitudes and behaviours. Ensuring justice in these areas within educational institutions is critical to fostering employee performance, commitment, and overall institutional success.

Concept of Employee Performance

Employee performance refers to the overall quantitative and qualitative contribution an individual or group makes toward achieving specific organizational tasks and goals. It reflects the degree to which employees meet determined targets and effectively fulfil assigned responsibilities. Performance is not an isolated phenomenon but is influenced by the work environment, managerial practices, and individual factors such as skills, motivation, and job satisfaction (Ijeuru Francis-Odii et al., 2020). Hence, managers must understand the conditions and behavioural factors that foster enhanced employee performance and create a supportive environment that aligns individual and organizational goals (Zhang, 2024). In modern organizational contexts, employee performance encompasses both the quality and quantity of work achieved relative to mutually agreed standards or targets. Effective performance management systems seek to improve individual and collective outputs by integrating performance activities with overall organizational objectives (Dehkharghani, 2023). Employee performance is closely linked to job satisfaction and the perceived fairness of rewards and recognition, which together influence employees' willingness to apply their abilities and effort.

Recent studies focusing on educational institutions highlight the significant effects of organizational silence and justice on employee performance. Organizational silence, characterized by employees withholding ideas or concerns, often leads to reduced productivity and low morale among academic staff (Alenezi, 2023). Conversely, organizational justice, through fairness in resource distribution, decision-making processes, and respectful interpersonal treatment, fosters trust and motivation, which in turn improve performance outcomes (Kuuyelleh, 2025).

Empirical research in educational settings underscores that the presence of open communication, supportive leadership, and perceived organizational fairness significantly enhances employee performance. When employees feel heard and fairly treated, their engagement and productivity increase, contributing

positively to institutional effectiveness (Francis-Odii et al., 2020). Therefore, promoting an organizational climate that reduces silence and advances justice is crucial in improving employee output and achieving educational institutions' objectives.

Theoretical Review

Social Exchange Theory (SET), originally proposed by Blau (1964), emphasizes the reciprocal nature of relationships between employees and their organizations. Employees invest their time, skills, and commitment in exchange for rewards such as pay, recognition, job security, and growth opportunities. When this exchange is perceived as fair and balanced, employees are more likely to reciprocate with positive attitudes, open communication, and improved performance (Emmanuel & Al-Janat, 2022). Conversely, when employees feel that their contributions are undervalued or ignored, they may withdraw effort, disengage, and choose silence over voicing concerns or ideas. This withdrawal not only disrupts the reciprocity balance but also diminishes innovation, motivation, and overall productivity (Khalid & Ahmed, 2021).

Organizational silence can manifest in two dimensions. The first involves silence directed toward the organization, where employees deliberately withhold feedback or suggestions that could enhance institutional processes. The second dimension involves silence toward individuals, where employees avoid expressing concerns or criticisms about specific colleagues or leaders. Both forms of silence erode trust, psychological safety, and ultimately, employee performance (Abubakar & Mahmood, 2023). From the lens of Social Exchange Theory, silence undermines the principle of reciprocity, as employees perceive little benefit in engaging in open dialogue when organizational responsiveness or fairness is absent. Organizational Justice Theory further enriches the understanding of employee voice and silence. This theory posits that employees' perceptions of fairness significantly shape their behaviour and performance outcomes (Pirzada et al., 2020). Organizational justice is typically divided into three dimensions:

- Distributive Justice – which refers to employees' perceptions of fairness in the allocation of outcomes such as pay, promotions, and recognition. When employees believe rewards are equitably distributed, they are more likely to voice constructive opinions and remain committed to organizational goals (Rahman et al., 2021).
- Procedural Justice – which emphasizes the fairness and transparency of organizational decision-making processes. Employees are more willing to contribute ideas and feedback when procedures are perceived as

unbiased, consistent, and participatory (Wu et al., 2022).

Interactional Justice – which centres on the quality of interpersonal treatment, communication, and respect that employees experience from supervisors and colleagues. Respectful interactions encourage employees to express themselves openly, leading to improved trust, commitment, and performance (Agarwal & Sajid, 2021).

In educational institutions, where knowledge-sharing and innovation are critical, the absence of organizational justice often fosters silence. Employees may avoid expressing ideas due to fear of negative consequences or perceptions of futility, which stifles growth and reduces institutional effectiveness (Chaudhary et al., 2023). On the other hand, when justice is present across distributive, procedural, and interactional dimensions, employees are more likely to feel psychologically safe, empowered, and motivated to contribute, thereby enhancing performance.

From the reviewed theories, it is evident that organizational silence has a negative effect on employee performance, as it reduces motivation, collaboration, and creativity. Conversely, fostering a culture of fairness, transparency, and open communication promotes psychological safety, strengthens employee commitment, and enhances performance outcomes. For educational institutions in Edo State, addressing silence through justice-driven policies and leadership practices is essential for long-term effectiveness and sustainability.

Empirical Review

Recent empirical studies consistently highlight the negative impact of organizational silence on employee performance. For instance, Shojaie, Matin, and Barani (2021) demonstrated that silence within organizations contributes to absenteeism, decreased morale, and overall poor organizational outcomes. Similarly, Osboei and Nojabae (2023) found that fear of negative repercussions remains a primary reason employees withhold valuable information, leading to inefficiencies, reduced innovation, and weakened organizational effectiveness. Leadership style and the communication climate have been identified as critical factors influencing whether employees feel safe to voice concerns or remain silent (Ikou & Chukwu, 2024; Naquib, Muhammad, and Hafiz, 2022). Within educational institutions specifically, employee silence has been shown to hamper both academic and administrative innovation, thereby limiting institutional growth and adaptability (Yıldız, 2021; Frances, Cindy & Bishara, 2023).

In contrast, organizational justice has been found to have a powerful and positive influence on employee engagement and performance. Studies by Colquitt et al.

(2020) and Gupta and Shaw (2022) emphasize that employees' perceptions of fairness in resource allocation, processes, and interpersonal treatment significantly enhance productivity, loyalty, and openness in communication. Cohen-Charash and Spector's (2021) meta-analysis confirms strong links between distributive, procedural, and interactional justice and outcomes such as job satisfaction, organizational commitment, and performance. Furthermore, Colquitt (2022) argues that justice perceptions cultivate a sense of belonging and encourage organizational citizenship behaviour, which in turn mitigates the detrimental effects of organizational silence. Collectively, these empirical findings illustrate that while organizational silence poses a substantial threat to employee performance, organizational justice can serve as a critical mitigating factor. The interplay between these constructs underscores the importance of fostering fair and transparent organizational practices alongside a communication culture that values employee voice. This nexus presents a compelling area for empirical investigation within educational institutions in Edo State, where performance is closely tied to employee motivation, communication, and perceptions of fairness.

Methodology

This study adopted a quantitative research design using a descriptive and exploratory survey method to investigate the effect of organizational silence and organizational justice on employee performance in selected educational institutions in Edo State, Nigeria. The choice of this design is justified by its suitability for describing existing phenomena, exploring relationships among variables, and enabling generalization from a sample to the wider population. The study purposively select 50 (fifty) academic and 50 (fifty) non-academic staff from selected universities, polytechnics, and colleges of education through random sampling across the government-owned tertiary institutions in Edo state, Nigeria, namely, University of Benin, Benin-City, Ambrose Alli University, Ekpoma, Auchi Polytechnic, Auchi., College of Education, Ekiadolor, Edo State. The decision to include both categories of staff was to ensure that the perspectives of individuals directly involved in teaching, research, and administration, as well as those handling supportive and managerial functions, were adequately captured. The distribution of the population for the study is captured below:

Table 1: Population of the Study

S/N	Name of Institution	Academic Staff	Non Academic Staff	Total
1	University of Benin, Benin City, Edo State	17	15	32
2	Ambrose Alli University, Ekpoma	15	15	30
3	Auchi Polytechnic, Auchi	12	11	23
4	College of Education, Ekiadolor	6	9	15
	TOTAL	50	50	100

Source: Field Survey, 2025

A simple random sampling technique was used to ensure diverse representation. A structured questionnaire with three sections was used for data collection: (demographic information, organizational silence, organizational justice and employee performance (measured using a 5-point Likert scale, e.g. 1 – Strongly Disagree, 2 – Disagree, 3 – Neutral, 4 – Agree, 5 – Strongly Agree). Data analysis was conducted using SPSS Version 25.0, with descriptive statistics for summarizing responses and multiple

regression analysis for testing the relationship between organizational silence and organizational justice on employee performance. The model was tested at a 5% significance level ($p < 0.05$). Ethical considerations were to ensure anonymity, confidentiality, and voluntary participation. This methodology provided a structured and reliable approach to understand the effects of organizational silence and organizational justice on employee performance in educational institutions.

Presentation of Data and Analysis

Question 1- 5

Table 2: Organizational silence (Independent Variable – X₁): (Measures the extent to which employees withhold ideas, feedback, or concerns in the workplace.)

Statements	SA	A	U	DA	SD	STD	M
I often choose not to speak up about work-related issues due to fear of negative consequences.(OS1)	10	29	49	9	3	18.92	20.00
I feel that my opinions and suggestions are not valued by my organization.(OS2)	9	31	26	22	12	9.30	20.00
I hesitate to provide feedback because I believe it will not lead to any changes.(OS3)	24	36	22	12	6	11.58	20.00
I avoid reporting problems or mistakes because of possible repercussions. (OS4)	12	30	24	21	13	7.58	20.00
My organization discourages open discussions about workplace challenges.(OS5)	24	39	20	12	5	12.92	20.00

Source: Field Survey, 2025

Descriptive Analysis of organizational support (OS1–OS5)

Mean scores across all five items are consistent at 20.00, suggesting a balanced perception of support across the board. **Standard deviations**, however, vary: OS1: 18.92 (very high variability). Implication:

Despite similar average ratings, OS1 in particular shows a high deviation, indicating a split among respondents—some may perceive strong support, others very little. This inconsistency may relate to selective recognition, unequal access to resources, or leadership gaps.

Questions 6-10

Table 3: Organizational Justice (Independent Variable – X₂): (Measures how matters relating to employees are handled with fairness and justice)

Statements	SA	A	U	D	SD	STD	M
I believe that my organization treats all employees fairly.(OJ1)	11	30	25	21	13	8.00	20.00
Decisions about promotions and rewards are made impartially(OJ2)	24	36	22	12	6	11.58	20.00
I am treated with respect and dignity by my supervisors.(OJ3)	12	30	24	21	13	7.58	20.00
Procedures used to make work-related decisions are consistent and transparent.(OJ4)	24	3	20	12	5	9.15	20.00
I feel that my contributions to the organization are recognized and valued.(OJ5)	11	30	25	21	13	8.00	20.00

Source: Field Survey, 2025

Descriptive Data Analysis of Organizational Justice (OJ1–OJ5)

Mean scores for OJ1, OJ2, OJ3, and OJ5 are all consistent at **20.00**, while OJ4 shows a lower mean of **12.80**. This suggests that respondents had a generally moderate perception of justice within the organization across most indicators. **Standard deviation (SD)** ranges from **7.58 to 11.58**, with the highest dispersion in **OJ2 (11.58)** and **OJ4 (9.15)**. This indicates variability in how justice is perceived, especially in OJ2 (perhaps procedural justice or fairness of processes) and OJ4 (possibly related to equitable treatment or resource allocation). **Implication:** Organizational justice is moderately rated, but the spread in perception suggests inconsistencies in how different aspects of justice are experienced among sta

Questions 11-15

Table 4: Employee Performance (Dependent Variable - Y₁): *(Measures how effectively employees complete tasks and contribute to organizational goals.)*

Statements	SA	A	U	D	SD	STD	M
I consistently complete my tasks on time and meet performance expectations.(Q11)	37	30	13	19	1	14.14	20.0
My work contributes to the overall success of my organization(Q12)	40	35	16	9	0	17.04	20.0
I feel motivated to put extra effort into my job responsibilities(Q13)	42	27	17	12	2	15.25	20.0
I receive constructive feedback that helps improve my performance(Q14)	39	36	13	9	3	16.40	20.0
I am able to work efficiently, even under pressure.(Q15)	18	32	20	18	12	7.35	20.0

Source: Field Survey, 2025

Descriptive Data Analysis of Employee Performance (EP1–EP5)

Standard deviations for EP1–EP5 range from **7.35 (EP5)** to **17.04 (EP2)**. These values indicate substantial variability in perceived employee productivity. The highest variation is observed in EP2 (SD = 17.04), potentially reflecting mixed views on certain performance criteria (e.g., task completion or output quality). **Implication:** While specific mean values weren't provided, the high variation implies differing levels of productivity across employees likely influenced by motivation, work environment, or support.

Overall Observations: Homogeneity vs. Variability: The data shows relatively uniform mean scores but high variability in responses, especially in EP and OS dimensions. Lowest Mean: OJ4 (12.80), suggesting a need for improvement in that particular area of justice. Most Consistent: OJ3 and OS4 (SD = 7.58), indicating stable perceptions among respondents. Most Divisive: OS1 and EP2 (SD = 18.92 and 17.04 respectively), warranting further qualitative inquiry.

Testing of the Hypothesis

(H₀): Organizational silence does not significantly affect employee performance in educational institutions in Edo State

Table 5 :Model Summary^b

Model	R	R ²	Adj. R ²	Std.Error Of the estimate	R ² change	Change Statistics				Durbin-Watson
						F Change	df1	df2	Sig.of Change	
1	.636 ^a	.405	.392	.44216	.405	32.951	2	97	.000	1.655

Source: SPSS 25.0 Data Output

a. Predictors: (Constant) OJ, OS

b. Dependent variable : EP

Summary Interpretation

0.636: This indicates a moderate to strong positive correlation between the independent variables

(Organizational Justice [OJ] and Organizational Silence [OS]) and the dependent variable (Employee Performance [EP]). It suggests that changes in OJ and OS are moderately to strongly associated with changes in EP. $R^2 = 0.405$: About 40.5% of the variation in employee performance is explained by the combination of OJ and OS. This is a substantial portion, suggesting these factors are key determinants of performance. Adjusted $R^2 = 0.392$: After adjusting for the number of predictors, about 39.2% of the variance

in EP is still explained. This indicates that the model is stable and not overfitted. Standard Error of the Estimate = 0.44216: The average deviation of the observed EP values from the predicted values is relatively low, meaning the model's predictions are fairly accurate. Durbin-Watson = 1.655: This value suggests there is no significant autocorrelation in the residuals, and therefore the assumption of independence of errors is met.

Table 6: ANOVA^a

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	12.884	2	6.442	32.951	.000 ^b
Residual	18.964	97	0.196		
Total	31.848	99			

Source: SPSS 25.0 Data Output

- Dependent variable : EP
- Predictors (Constant) OJ, OS

7) = 32.951, $p = 0.000$: The F-test result is highly significant, indicating that the model, which includes OJ and OS, significantly predicts employee performance. In other words, at least one of the predictors has a non-zero regression coefficient

ANOVA Interpretation

Table 7: Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std Error	Beta		
(Constant)	2.408	.242		9.971	0.000
OS	0.106	.111	.119	.954	0.343
OJ	.321	.074	.539	4.321	0.000

Source: SPSS 25.0 Data Output

- Dependent Variable: EP

Organizational Silence (OS) and Organizational Justice (OJ) on the dependent variable, Employee Performance (EP):

Unstandardized Coefficients (B):

Constant (2.408):

This is the expected value of EP when both OS and OJ are zero. It's the baseline level of employee performance.

OS (0.106): A one-unit increase in Organizational Silence results in a 0.106 unit increase in Employee Performance, holding Organizational Justice constant. However, the effect is not statistically significant ($p = 0.343 > 0.05$), meaning there's no reliable evidence that silence impacts performance.

OJ (0.321): A one-unit increase in Organizational Justice leads to a 0.321 unit increase in Employee Performance, holding OS constant. This effect is statistically significant ($p = 0.000 < 0.05$).

Standardized Coefficients (Beta):

These values allow comparison of the relative strength of each predictor:

OS Beta = 0.119

Indicates a weak, positive, but insignificant influence on employee performance.

OJ Beta = 0.539

Shows a strong and significant positive impact on employee performance. OJ is clearly the more influential factor between the two.

t-values and Significance (Sig.):

OS: $t = 0.954$, Sig. = 0.343 The predictor is not significant. OJ: $t = 4.321$, Sig. = 0.000 is Highly significant, meaning OJ has a real, measurable effect on EP.

Conclusion of Coefficient Analysis: Organizational Justice (OJ) significantly and positively influences employee performance. Organizational Silence (OS) shows a weak and statistically insignificant influence. Management should focus more on promoting fairness and justice in the workplace as a

driver of employee performance, while not ignoring the potential long-term effects of unchecked silence.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \varepsilon$$

$$Y = 2.408 + 0.106X_1 + 0.321X_2$$

Y= Employee Performance (Dependent variable)

X₁ =Organizational silence (Independent variable)

X₂ = Organizational Justice (Independent variable)

β₀= Intercept (baseline employee performance when organizational silence is zero)

β₁= Coefficient measuring the effect of organizational silence on employee performance

β₂= Coefficient measuring the effect of organizational justice on employee performance

ε = Error term (Captures unexplained variations)

Discussion of Findings

The study examined the effect of organizational silence on employee performance in selected educational institutions in Edo State. The findings reveal that **organizational justice (OJ)** is a significant predictor of employee commitment, with a standardized coefficient (Beta) of 0.539 and a statistically significant p-value of 0.000. This indicates that fairness in the workplace, including distributive, procedural, and interactional justice, plays a critical role in fostering employee dedication.

This result aligns with recent evidence from public universities in Ethiopia, where organizational justice positively influenced employee commitment, with job satisfaction partially mediating the relationship. (Gollagari, Birega, & Mishra, 2024) Similarly, studies in banking in Nigeria show strong and significant relationships between perceptions of organizational justice (especially distributive and procedural) and affective commitment. (Ogunkoya, Soremekun, Banjo, & Fadeyi, 2024)

On the other hand, **organizational silence (OS)** showed a positive but statistically insignificant influence on employee commitment (Beta = 0.119, p = 0.343). This contradicts findings in the Greek public sector, where organizational silence was shown to negatively affect all dimensions of organizational commitment. (Efthymiopoulos, Goula, & Psychogios, 2024) The insignificance in the current context may be due to other intervening variables such as leadership style or communication flow, which were not controlled in this study.

Moreover, the stronger influence of OJ over OS may reflect employees' higher sensitivity to fairness and equity in public institutions where bureaucracy and perceived favouritism are common. This is supported by extended longitudinal evidence from Hong Kong in a "job demands–resources" framework, showing that all dimensions of organizational justice (procedural, distributive, informational, interpersonal) measured at baseline had direct positive associations with affective commitment one year later. (Ho, 2025)

CONCLUSION

This study concludes that organizational justice is a more powerful and significant determinant of employee commitment than organizational silence in public educational institutions. While organizational support or silence behaviours are relevant, it is the perception of fairness and justice that predominantly drives employees to remain loyal, engaged, and committed to organizational goals.

RECOMMENDATIONS

Strengthen fairness in procedures and policies – Management should ensure transparent and equitable treatment in resource allocation and decision-making processes.

Promote interactional justice – Training managers on respectful and dignified communication can enhance trust and reduce workplace resentment.

Re-evaluate support mechanisms – Although OS was not statistically significant, it's important for the organization to reassess whether existing support systems are genuinely perceived as beneficial or merely symbolic.

- iv. Further research – Future studies should explore mediating variables such as job satisfaction, leadership style, or psychological safety that could influence the OS-commitment relationship.

Publication Date: 2025/11/28

Abstract

This study investigated the impact of sustainability reporting on corporate financial performance of listed oil and gas firms in Nigeria between 2015 and 2024, with return on equity (ROE) as the performance proxy. Using an ex-post factor design and purposive sampling, data were collected from annual and sustainability reports of ten listed firms and analyzed using panel regression models with random effects. The results indicated that energy intensity (EI) positively and significantly improved ROE, reflecting the profitability benefits of energy efficiency. Water management rate (WMR) also exerted a positive and significant effect, suggesting that responsible water use strengthened financial outcomes and stakeholder legitimacy. In contrast, air pollutant emissions intensity (APEI) had a negative and significant effect on ROE, confirming that higher emissions damaged profitability through compliance costs and reputational risks. Greenhouse gas emissions intensity (GHGI), however, was positive but statistically insignificant, implying that climate-related initiatives did not yet produce short-term financial benefits. These findings supported both the Triple Bottom Line and Legitimacy theories, highlighting how sustainability practices influenced profitability, stakeholder trust, and long-term corporate resilience. The study concluded that sustainability reporting played a critical role in shaping financial performance and recommended investment in energy and water efficiency, stronger emission control, and more credible greenhouse gas reporting. Overall, the research emphasized that integrating sustainability practices into business strategies was vital for achieving both environmental stewardship and financial success in Nigeria's oil and gas sector.

Key Words: *Sustainability reporting, Energy intensity, Water management rate, Air pollutant emissions intensity, Greenhouse gas emissions intensity, Return on equity, Corporate financial performance, Oil & Gas firms.*

Background to the Study

The global focus on sustainable development has significantly increased the importance of environmental performance metrics such as energy intensity, water management rate, air pollutant emissions intensity, and GHG emissions intensity. These metrics are now seen as crucial indicators of corporate environmental impact and operational efficiency. In Nigeria, where industrial and extractive activities dominate, integrating such environmental measures into sustainability reporting has gained growing attention from both academics and regulators. Recent studies indicate that carbon and GHG emissions disclosures may reduce market competitiveness among non-financial listed firms in Nigeria (Agbo et al 2024).

Similarly, environmental investment disclosures have shown mixed effects on financial performance, with water protection disclosures found to enhance performance, while air protection disclosures produced negative outcomes (Emenyi, 2024).

Alongside these trends, Nigeria's regulatory environment is undergoing significant transformation. In March 2024, the government announced that large firms must begin mandatory eco-friendly and climate-related disclosures by 2027, while smaller firms were given until 2030 to comply (Reuters, 2024). This regulatory momentum highlights the pressing need for empirical studies that can clarify how sustainability performance translates into financial outcomes, especially in industries associated with significant

environmental externalities. Yet, empirical evidence directly linking carbon accounting and financial performance among listed manufacturing firms remains limited. A 2025 study revealed that although carbon accounting influences return on assets, the relationship was not statistically significant (Appah et al 2025). This points to the need for broader inquiry into how environmental intensity metrics beyond carbon accounting shape profitability, particularly when profitability is measured through return on equity.

In the context of Nigeria's oil and gas sector, the environmental burdens are extensive, including high levels of emissions and water contamination, making the industry a focal point for sustainability research (Popoola & Onmonya, 2024). Given its central role in the national economy and its exposure to global scrutiny, it is crucial to examine how environmental stewardship in this sector intersects with financial performance outcomes such as return on equity. Therefore, situating sustainability reporting proxies such as energy intensity, water management rate, air pollutant emissions intensity, and GHG emissions intensity alongside corporate financial performance of oil and gas firms addresses an important research gap. This study seeks to provide fresh insights into how environmental intensity measures influence financial performance within high-impact industries, in line with emerging regulatory expectations and the rising investor demand for credible sustainability reporting.

Statement of the Problem

The increasing global and national demand for sustainable business practices has drawn attention to how environmental performance measures such as energy intensity, water management rate, air pollutant emissions intensity, and GHG emissions intensity influence corporate financial performance, particularly return on equity among oil and gas firms in Nigeria. However, existing findings in the literature remain inconclusive and inconsistent. Popoola and Onmonya (2024) reported that environmental disclosure enhanced ROE but negatively affected other profitability indices, while Soomiyol et al (2023) observed only a weak link between sustainability practices and financial performance in listed firms. Likewise, Appah et al (2025) showed that carbon accounting had no significant impact on profitability indicators, pointing to the limitations of aggregated environmental disclosures in explaining financial outcomes. Emenyi (2024) further revealed that water protection disclosures improved financial performance whereas air protection disclosures diminished it, reflecting heterogeneous effects of different environmental dimensions. These divergent findings expose a clear research gap requiring the use of advanced econometric techniques such as panel

regression to control for firm-level heterogeneity and time dynamics, thereby providing more precise evidence of how sustainability proxies affect ROE in the Nigerian oil and gas sector. Addressing this issue is timely, given the regulatory push for mandatory climate-related reporting and the heightened expectations of investors for credible linkages between sustainability reporting and financial performance in environmentally sensitive industries.

Research Objectives

The primary objective of this study is to examine the relationship between sustainability reporting and corporate financial performance of listed oil and gas firms in Nigeria. The specific objectives are to:

- To examine the effect of energy intensity on the return on equity of listed oil and gas firms in Nigeria.
- To assess the relationship between water management rate and the return on equity of listed oil and gas firms in Nigeria.
- To investigate the impact of air pollutant emissions intensity on the return on equity of listed oil and gas firms in Nigeria.
- To evaluate the influence of GHG emissions intensity on the return on equity of listed oil and gas firms in Nigeria.

Research Hypotheses

H0₁: Energy intensity has no significant effect on the return on equity of listed oil and gas firms in Nigeria.

H0₂: Water management rate has no significant relationship with the return on equity of listed oil and gas firms in Nigeria.

H0₃: Air pollutant emissions intensity has no significant impact on the return on equity of listed oil and gas firms in Nigeria.

H0₄: GHG emissions intensity has no significant influence on the return on equity of listed oil and gas firms in Nigeria.

Conceptual Review

Sustainability Reporting

Sustainability reporting in Nigeria has gradually emerged as an important dimension of corporate disclosure, aimed at integrating environmental, social, and governance considerations into financial accountability. Scholars argue that the practice enhances transparency, improves stakeholder trust, and promotes long-term value creation, especially in high-impact industries such as oil and gas and manufacturing (Asuquo & Dada, 2022). Although frameworks such as the Global Reporting Initiative and the IFRS sustainability disclosure standards have influenced Nigerian firms, adoption remains inconsistent across sectors due to weak institutional enforcement, limited technical capacity, and varying

levels of awareness (Otalor, 2025). Recent evidence shows that while some listed firms disclose information on energy usage, waste management, and emissions, the depth and comparability of these disclosures remain limited, reflecting a fragmented approach to sustainability reporting in the country (Nwekwo et al 2025).

Linking sustainability disclosures to financial performance has further highlighted both opportunities and gaps. While some empirical studies find positive associations between sustainability reporting and firm performance, others reveal insignificant or even negative relationships depending on the dimensions measured, pointing to the heterogeneous nature of sustainability practices (Agbakwuru, 2025). This suggests that reporting in Nigeria is still evolving, shaped by global frameworks but hindered by contextual realities such as regulatory weaknesses and the dominance of extractive industries. As the Financial Reporting Council of Nigeria gradually integrates sustainability guidelines, and with increasing investor interest in ESG data, the framework of sustainability reporting in Nigeria is moving from voluntary philanthropy-based disclosures toward more structured and strategic reporting. However, achieving consistency and comparability will require stronger enforcement, harmonization of frameworks, and capacity building for firms to fully embed sustainability reporting as a driver of corporate accountability and performance.

Energy Intensity (EI): Energy intensity, which reflects the amount of energy consumed per unit of output, is a critical sustainability metric for oil and gas firms in Nigeria due to the sector's heavy reliance on fossil fuels and its significant contribution to greenhouse gas emissions. High energy intensity signals inefficiency and increased operational costs, while improvements in energy management can enhance profitability and environmental performance (Asuquo & Dada, 2022). Recent scholarship emphasizes that addressing energy intensity is essential for Nigerian firms to align with global sustainability standards and reduce their carbon footprint (Nwekwo et al 2025). However, despite rising awareness, structural inefficiencies and weak regulatory enforcement continue to limit progress in achieving energy-efficient operations (Otalor, 2025).

Water Management Rate (WMR): Water management rate represents the efficiency of water use, recycling, and contamination control within oil and gas operations in Nigeria, a sector notorious for intensive water use and recurrent pollution of local water bodies. In the Niger Delta, oil exploration and spills have severely compromised water quality and community

access to clean water, exacerbating environmental and social challenges (Environmental issues in the Niger Delta, 2025). Nigeria has substantial surface and groundwater resources, but these are imperiled by oil-related contamination and weak regulatory oversight (Omokaro et al., 2024). Consequently, enhancing water management practices through strategies such as improved recycling, stricter effluent standards, and robust monitoring is critical for reducing environmental degradation and reinforcing sustainable operations in oil and gas firms.

Air Pollutant Emissions Intensity (APEI): Air pollutant emissions intensity, which measures the volume of pollutants released relative to output, is a crucial sustainability concern in Nigeria's oil and gas sector due to widespread gas flaring, particulate matter emissions, and volatile organic compounds that degrade air quality and harm human health. The Niger Delta remains the most affected, where continuous flaring has been linked to respiratory illnesses and environmental degradation (Environmental issues in the Niger Delta, 2025). Studies further note that although Nigeria has policies against routine flaring, enforcement remains weak, resulting in persistently high emissions intensities across firms (Akinbami et al 2021). Reducing air pollutant emissions intensity therefore requires stricter regulatory oversight, improved technology adoption, and stronger sustainability commitments from oil and gas operators.

Greenhouse Gas Emissions Intensity (GHGI): GHG emissions intensity, which captures the volume of greenhouse gases emitted per unit of production, is a central sustainability concern in Nigeria's oil and gas sector due to persistent gas flaring and methane leaks that significantly elevate the nation's carbon footprint. Offshore operations in Nigeria were recently reported to average 41 kg CO₂e per barrel of oil equivalent, reflecting high emissions compared to global benchmarks (S&P Global, 2024). Scholars emphasize that reducing GHG intensity requires stronger enforcement of anti-flaring policies, investments in low-carbon technologies, and alignment with international climate disclosure standards (Nwekwo et al 2025).

Corporate Financial Performance

Corporate financial performance in Nigeria is widely regarded as a multidimensional construct that reflects the efficiency, profitability, and overall competitiveness of firms within the country's dynamic and often volatile economic environment. It is influenced by both internal capabilities, such as resource utilization and management efficiency, and external pressures, including regulatory demands,

market fluctuations, and sustainability expectations. Scholars have emphasized that corporate financial performance goes beyond short-term profitability to encompass long-term value creation and stakeholder satisfaction, especially as firms face rising demands for accountability and transparency (Asuquo & Dada, 2022). In Nigeria's oil and gas sector, financial performance is particularly sensitive to global energy transitions, domestic policy reforms, and environmental obligations, making robust performance measurement frameworks essential for aligning profitability with sustainability objectives (Otalor, 2025). The integration of sustainability metrics into corporate reporting has thus become increasingly important for evaluating financial performance in ways that meet both investor expectations and regulatory standards (Nwekwo et al 2025).

Within this broader framework, return on equity (ROE) serves as a key proxy for corporate financial performance, providing a direct measure of how efficiently firms generate profit from shareholders' investments. ROE is particularly relevant in evaluating oil and gas firms in Nigeria because it reflects not only profitability but also management's ability to balance operational risks with capital allocation. Researchers have observed that while some sustainability practices positively influence ROE, others show insignificant or even negative relationships, highlighting the complexity of linking environmental initiatives to shareholder returns (Agbakwuru, 2025). This suggests that the use of ROE as a proxy allows for deeper exploration of whether sustainability reporting practices such as energy intensity, water management, air pollutant emissions, and GHG intensity truly enhance financial outcomes. Consequently, examining ROE within the sustainability context provides a valuable lens for understanding how Nigerian oil and gas firms can reconcile financial success with environmental accountability.

Theoretical Review

Triple Bottom Line (TBL) Theory

The Triple Bottom Line theory, introduced by Elkington in 1994, broadens the traditional financial performance focus by emphasizing three dimensions: profit, people, and planet. It posits that firms create long-term value not only by generating economic returns but also by addressing social equity and environmental sustainability. In Nigeria's oil and gas industry, the TBL framework underscores the importance of managing energy consumption, water resources, and emissions alongside financial performance indicators such as return on equity. This approach highlights that sustainable business practices can reduce environmental harm, foster community goodwill, and enhance financial resilience. The TBL

theory is therefore highly relevant for evaluating how sustainability reporting proxies integrate with corporate financial performance in environmentally sensitive sectors.

Legitimacy Theory

Legitimacy theory was first articulated by Dowling and Pfeffer in 1975, emphasizing that organizations continually seek to ensure their operations are perceived as legitimate within the broader societal framework. The theory posits that firms disclose sustainability information, such as energy intensity, water management, and emissions reduction, to align with societal expectations and secure their social license to operate. In the Nigerian oil and gas sector, where environmental challenges are prominent, legitimacy theory explains why firms adopt sustainability reporting practices to mitigate reputational risks, comply with regulatory requirements, and maintain stakeholder trust. Thus, legitimacy theory provides a lens for understanding the motivations behind sustainability disclosures and how they relate to firms' financial outcomes, including return on equity.

Empirical Review

Onwubiko et al. (2025) examined ESG disclosures and ROE in Nigerian oil and gas firms using regression. Results showed social disclosures negatively affect ROE, governance disclosures significantly improve ROE, and environmental disclosures were positive but insignificant. They concluded sustainability reporting influences performance differently and recommended strengthening governance while maintaining socially responsible practices.

Sudi (2025) assessed environmental and economic reporting in downstream oil and gas firms using GRI indices and regression. Findings showed environmental reporting had an insignificant positive effect on NPM, while economic reporting significantly improved profitability. The study concluded economic disclosures better drive performance and recommended compliance with environmental laws and stronger economic reporting.

Eneh (2024) analyzed sustainability disclosures of eight listed oil and gas firms (2014–2023) using GRI content analysis. Findings revealed disclosures exist, but environmental reporting lags behind economic and social aspects. The study concluded deeper environmental reporting could improve reputation and performance and recommended more balanced, credible disclosure practices.

Agbo (2024) investigated GHG and energy disclosures using panel regression. Results showed GHG disclosure negatively impacts competitiveness, while energy disclosure had a positive but insignificant effect. The study concluded transparency in emissions

reporting is essential for competitiveness and recommended improved GHG management and strengthened sustainability disclosures.

IIARD (2023) examined sustainability reporting and performance of Nigerian oil and gas firms using content analysis and regression. Findings showed environmental and social disclosures significantly improve ROE and ROA. The study concluded disclosure influences financial outcomes and recommended standardized frameworks and stronger regulatory enforcement.

Nahlazbery (2023) studied sustainability reporting in ten oil and gas firms (2013–2022) using OLS regression. Results showed environmental, social, and economic disclosures positively affect ROE and ROA. The study concluded reporting promotes value creation and recommended adoption of global frameworks and strict regulatory enforcement.

Iliemena (2023) investigated disclosure effects on profitability of 23 Nigerian manufacturing firms (2012–2021) using regression. Results showed social disclosure improves GPM, while environmental disclosure had no effect on ROCE. The study concluded social reporting enhances profitability and recommended improving environmental reporting quality.

Onoh (2022) examined environmental reporting and firm value of listed Nigerian oil and gas firms using regression. Findings showed environmental disclosure significantly enhances firm value. The study concluded reporting builds investor confidence and recommended stronger environmental disclosures to improve transparency and long-term sustainability.

Research Methodology

Research Design

This study adopts an ex-post facto research design, which is appropriate since the researcher cannot manipulate the financial and sustainability reporting data of firms but can only analyze past records. The design enables the evaluation of cause-and-effect relationships between sustainability reporting proxies and corporate financial performance using historical data from audited financial statements and sustainability reports of oil and gas firms listed in Nigeria from 2015 to 2024.

Population of the Study

The population comprises all oil and gas firms listed on the Nigerian Exchange (NGX) as of 2024. These firms operate in upstream, midstream, and downstream segments, contributing significantly to Nigeria's economy while also being heavily scrutinized for environmental impacts. Their inclusion provides a comprehensive platform for examining the nexus

between sustainability reporting and corporate financial performance.

Sample and Sampling Techniques

A purposive sampling technique was adopted to select 10 listed oil and gas firms with consistent availability of annual reports and sustainability disclosures between 2015 and 2024. The sampled firms are Seplat Energy Plc, Oando Plc, TotalEnergies Marketing Nigeria Plc, Conoil Plc, Eterna Plc, MRS Oil Nigeria Plc, Ardova Plc, 11 Plc (Mobil Oil Nigeria), Japaul Gold & Ventures Plc, and Aradel Holdings Plc. This ensures reliability and relevance of data.

Method of Data Collection

Secondary data were collected from the audited financial statements and sustainability reports of the sampled firms covering the period 2015–2024. The ten-year timeframe provides sufficient data points for panel regression analysis while capturing evolving reporting practices. Data were extracted systematically, focusing on financial variables and sustainability indicators consistent with Global Reporting Initiative (GRI) standards and corporate governance disclosures.

Method of Data Analysis

The study employed panel least squares regression using E-Views 9.0, with both fixed and random effects models estimated to account for firm-level heterogeneity. Hausman tests guided model selection. Several diagnostic tests were performed, including cross-sectional dependence tests. Panel unit root tests ensured stationarity, while Pedroni cointegration test verified long-run relationships. Findings were interpreted with a 5% significance level to ensure robustness and reliability.

Model Specifications

The model specifies corporate financial performance proxied by return on equity (ROE) as the dependent variable, with sustainability reporting proxies as independent variables: energy intensity (EI), water management rate (WMR), air pollutant emissions intensity (APEI), and GHG emissions intensity (GHGI). The general panel regression model is:

$$ROE_{it} = \alpha + \beta_1 EI_{it} + \beta_2 WMR_{it} + \beta_3 APEI_{it} + \beta_4 GHGI_{it} + \mu_i + \epsilon_{it}$$

where i denotes firm and t denotes year.

Results and Discussion

The relationship between sustainability reporting and corporate financial performance in Nigerian oil and gas firms is critical for understanding how environmental practices influence profitability. This study examined the effects of EI, WMR, APEI, and GHGI on ROE from 2015 to 2024. Several econometric techniques

were applied to analyze the data, enabling clear insights into firm-level dynamics. The tests facilitated a systematic understanding of data properties, assessment of long- and short-run relationships among variables, and identification of the most suitable regression models for panel analysis. Each procedure was essential for ensuring robustness and reliability, thereby strengthening the credibility of the findings. Through these methods, the study provided a sound empirical basis for evaluating how sustainability practices affect financial outcomes, ensuring accurate

and trustworthy conclusions for both academic and policy relevance.

Descriptive Statistics

Descriptive statistics summarize key features of EI, WMR, APEI, GHGI, and ROE. They highlight central tendencies, dispersion, and variability, enabling preliminary insights into how sustainability indicators behave and how they may relate to corporate financial performance within Nigeria's oil and gas sector. This was presented in the Table below:

Table 1: Descriptive Statistics

Source: E-Views 9.0, 2025.

The descriptive results show that ROE averaged 7.94 with wide variability (SD = 9.03), ranging from negative values to a maximum above 26, indicating periods of both losses and profitability. EI averaged 35.76, with moderate dispersion, suggesting differences in operational efficiency across firms. WMR recorded a mean of 48.70 with relatively tight clustering, reflecting moderate consistency in water use practices. APEI averaged 2.19, showing stability with low dispersion, though skewness indicates slight asymmetry in emission intensity. GHGI had the highest mean (396.04) and wider spread (SD = 80.75),

reflecting substantial variations in greenhouse gas profiles among the firms.

Correlation Analysis

Correlation analysis assesses the degree and direction of association among EI, WMR, APEI, GHGI, and ROE. This identifies potential multicollinearity issues and provides early evidence of whether sustainability indicators are positively or negatively linked with financial performance. The correlation analysis was presented in Table 2 below.

Table 2: Correlation Analysis

	ROE	EI	WMR	APEI	GHGI
ROE	1.000000				
EI	0.597901	1.000000			
WMR	0.475103	0.751276	1.000000		
APEI	0.593194	0.587078	0.447327	1.000000	
GHGI	0.628114	0.658395	0.760408	0.471108	1.000000

Source: E-Views 9.0, 2025.

The correlation results indicate that ROE is positively related to EI (0.60), WMR (0.48), APEI (0.59), and GHGI (0.63), suggesting that higher sustainability metrics align with improved financial performance. EI shows strong positive association with WMR (0.75) and GHGI (0.66), reflecting energy use closely linked to water and emissions management. WMR also

correlates strongly with GHGI (0.76), emphasizing the interconnectedness of water and greenhouse gas controls. APEI maintains moderate correlations with EI (0.59) and ROE (0.59), but weaker with WMR (0.45). Overall, the variables exhibit strong interdependence, supporting the relevance of sustainability indicators in explaining financial outcomes.

Cross-Sectional Dependence Test

This test determines whether shocks affecting one oil and gas firm spill over to others. Detecting cross-estimates of sustainability indicators' effects on financial performance. This was presented below

sectional dependence is critical in panel data, as ignoring it could bias e

Table 3: Cross-Sectional Dependence Test

Residual Cross-Section Dependence Test

Null hypothesis: No cross-section dependence (correlation) in residuals

Equation: Untitled

Periods included: 10

Cross-sections included: 10

Total panel observations: 100

Cross-section effects were removed during estimation

Test	Statistic	d.f.	Prob.
Breusch-Pagan LM	61.32772	45	0.0530
Pesaran scaled LM	0.667000		0.5048
Bias-corrected scaled LM	0.111444		0.9113
Pesaran CD	1.876705		0.1006

Source: E-Views 9.0, 2025.

The results of the residual cross-section dependence test reveal that the Breusch-Pagan LM statistic (61.33, $p = 0.053$) is close to significance, suggesting a mild indication of cross-sectional correlation. However, the Pesaran scaled LM (0.67, $p = 0.50$) and bias-corrected LM (0.11, $p = 0.91$) confirm no evidence of dependence across firms. The Pesaran CD statistic (1.88, $p = 0.10$) is also insignificant, reinforcing the null hypothesis. Overall, the findings imply that the residuals from ROE, EI, WMR, APEI, and GHGI

models are largely independent across firms, validating the reliability of panel regression estimates without severe cross-sectional bias.

Panel Unit Root Test

Panel unit root test checks the stationarity of EI, WMR, APEI, GHGI, and ROE series. Ensuring stationarity prevents spurious regression results and validates the reliability of analyzing long-term sustainability-performance relationships among Nigerian oil and gas firms.

Table 4: ADF Panel Unit Root Test

Variables	Method	ADF Statistics	Probability	@ Level	Check for Stationary
ROE	ADF Test	24.3922	0.2260	1(0)	Non-Stationary
EI	ADF Test	11.1068	0.9434	1(0)	Non-Stationary
WMR	ADF Test	12.2509	0.9072	1(0)	Non-Stationary
APEI	ADF Test	27.5425	0.1207	1(0)	Non-Stationary
GHGI	ADF Test	23.5995	0.2603	1(0)	Non-Stationary
Variables	Method	Statistics	Probability	@1st Diff.	Check for Stationary
ROE	ADF Test	45.0673	0.0011	1(1)	Stationary
EI	ADF Test	46.4939	0.0007	1(1)	Stationary
WMR	ADF Test	51.0162	0.0002	1(1)	Stationary
APEI	ADF Test	55.9292	0.0000	1(1)	Stationary
GHGI	ADF Test	77.6826	0.0000	1(1)	Stationary

Source: E-Views 9.0, 2025.

The unit root test results indicate that at level, ROE, EI, WMR, APEI, and GHGI are all non-stationary as their probabilities exceed the 5% threshold, suggesting the

presence of unit roots. However, after first differencing, the ADF statistics become significant with probabilities well below 0.05, confirming that all variables attain stationarity at order one, I(1). This implies that the time

series for financial performance and sustainability indicators share common stochastic trends and require differencing to achieve stability. Hence, subsequent panel regression and cointegration analysis are valid, ensuring reliable long-run and short-run interpretations of the sustainability–performance relationship.

Table 5: Pedroni Residual Cointegration Test

Pedroni Residual Cointegration Test

Series: ROE EI WMR APEI GHGI

Date: 09/06/25 Time: 15:22

Sample: 2015 2024

Included observations: 100

Cross-sections included: 10

Null Hypothesis: No cointegration

Trend assumption: No deterministic trend

User-specified lag length: 1

Newey-West automatic bandwidth selection and Bartlett kernel

Alternative hypothesis: common AR coefs. (within-dimension)

	Statistic	Prob.	Weighted Statistic	Prob.
Panel v-Statistic	1.290857	0.9016	1.806783	0.9646
Panel rho-Statistic	2.895832	0.0118	3.946755	0.0007
Panel PP-Statistic	4.304206	0.0000	4.541922	0.0000
Panel ADF-Statistic	2.784586	0.0167	2.791524	0.0143

Alternative hypothesis: individual AR coefs. (between-dimension)

	Statistic	Prob.
Group rho-Statistic	3.481012	0.9998
Group PP-Statistic	10.07038	0.0000
Group ADF-Statistic	3.046728	0.0086

Source: E-Views 9.0, 2025.

The Pedroni residual cointegration test results reveal evidence of a long-run relationship among ROE, EI, WMR, APEI, and GHGI. Within-dimension statistics show that the panel rho, PP, and ADF are significant with probabilities below 0.05, indicating cointegration despite the panel v-statistic being insignificant. Similarly, between-dimension results reveal that while the group rho is insignificant, both the group PP and ADF statistics are highly significant. These outcomes confirm that sustainability reporting proxies and corporate financial performance move together in the

Pedroni Panel Cointegration Test

The Pedroni test examines whether EI, WMR, APEI, GHGI, and ROE share a long-run equilibrium relationship. Establishing cointegration confirms that sustainability practices and financial outcomes move together over time in Nigeria’s oil and gas sector. This was presented in the table below.

long run, suggesting stable equilibrium relationships. Thus, shocks in sustainability practices eventually align with firm performance across Nigeria’s oil and gas sector.

Redundant Fixed Effects vs Hausman Test

This step distinguishes whether firm-specific effects are best captured by fixed or random effects. The redundant test and Hausman procedure ensure the chosen regression model properly accounts for heterogeneity in sustainability–performance dynamics.

Table 6: Redundant Fixed Effects Tests Vs Correlated Hausman Test

Redundant Fixed Effects Tests

Equation: Untitled

Test cross-section fixed effects

Effects Test	Statistic	d.f.	Prob.
Cross-section F	12.856044	(9,86)	0.0000
Cross-section Chi-square	85.245593	9	0.0000

Correlated Random Effects - Hausman Test

Equation: Untitled

Test cross-section random effects

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	3.457383	4	0.4844

Source: E-Views 9.0, 2025.

The redundant fixed effects test indicates that the cross-section F statistic (12.86, $p = 0.0000$) and Chi-square statistic (85.25, $p = 0.0000$) are highly significant, confirming the presence of fixed effects across firms. This implies that firm-specific characteristics strongly influence the relationship between ROE, EI, WMR, APEI, and GHGI. However, the Hausman test result ($\chi^2 = 3.46$, $p = 0.4844$) shows that random effects are more appropriate, as the null hypothesis of no systematic difference between fixed and random estimates cannot be rejected. Thus, the random effect regression model

provides consistent and efficient estimates for this study.

Random Effect Regression

Random effect regression evaluates sustainability–performance linkages while assuming firm-specific effects are random. It provides efficient estimates when appropriate, enabling generalization of how EI, WMR, APEI, and GHGI affect ROE across Nigeria’s oil and gas firms. The random effect model was presented in Table 7 below.

Source: E-Views 9.0, 2025.

Table 7 presents the regression results showing the impact of sustainability reporting on the financial performance of listed oil and gas firms in Nigeria from 2015 to 2024. Using ROE as the dependent variable, a panel regression framework with random effects was applied to examine the effects of EI, WMR, APEI, and GHGI. Each variable's contribution to financial performance was evaluated at the 5% significance level to establish statistical relevance, offering insights into how sustainability indicators influence long-run profitability and value creation within Nigeria's oil and gas sector.

The random effects model shows that EI has a positive and highly significant effect on ROE, with a coefficient of 0.0458. This suggests that greater energy efficiency enhances profitability among Nigerian oil and gas firms by reducing costs and improving operational performance. This aligns with the profit dimension of the Triple Bottom Line (TBL) theory, which emphasizes eco-efficiency as a driver of financial sustainability, and with Legitimacy Theory, since efficient energy use enhances societal approval. Empirically, the finding supports Nahlazbery (2023) and IIARD (2023), who reported positive effects of environmental reporting on performance, and complements Agbo (2024), who highlighted the competitiveness benefits of energy disclosures. Thus, efficient energy management strengthens both financial and reputational outcomes.

WMR has a positive and significant coefficient (0.0249, $p = 0.0007$), implying that effective water management contributes positively to ROE. This outcome supports the people and planet dimensions of TBL theory, since responsible water use fosters community trust and mitigates environmental risks, thereby improving financial performance. Legitimacy Theory also explains this finding, as firms enhance their legitimacy by addressing a resource critical to host communities. Empirical evidence from IIARD (2023) and Nahlazbery (2023) similarly reported that sustainability practices improve financial outcomes, while Eneh (2024) emphasized the need for stronger environmental

disclosures. Hence, efficient water practices emerge as both a financial and social performance driver.

The result shows that APEI has a negative and significant effect on ROE, with a coefficient of -0.6302 . This indicates that higher pollutant emissions erode profitability, reflecting additional costs from regulatory penalties, reputational risks, and remediation expenses. The finding is consistent with the planet dimension of TBL, which stresses that unsustainable practices harm long-term profitability, and with Legitimacy Theory, as excessive emissions undermine firms' social license to operate. Empirically, this aligns with Agbo (2024), who reported that emissions disclosure negatively impacts competitiveness, and complements Onwubiko et al. (2025), who found mixed effects of environmental disclosures. This suggests that reducing emissions is both an environmental necessity and a financial imperative.

GHGI has a positive but insignificant coefficient (0.0164, $p = 0.4295$), suggesting no measurable effect on ROE in the short run. This finding may reflect time lags in monetizing climate-related initiatives, consistent with TBL theory's long-term orientation and Legitimacy Theory's view that disclosure without substantive action may not yield financial benefits. While IIARD (2023) and Nahlazbery (2023) found environmental reporting improves profitability, Agbo (2024) highlighted the complexity of GHG disclosure, sometimes yielding negative or insignificant impacts. This study suggests that, unless emission reductions are credibly implemented and integrated into operational efficiency, GHGI improvements may not yet translate into higher financial returns.

Conclusion

The results conclude that sustainability reporting significantly influences financial performance in Nigeria's oil and gas sector. Energy and water efficiency drive profitability and corporate legitimacy, while air pollutant emissions harm returns. However, greenhouse gas intensity remains financially insignificant in the short run, reflecting the complexity of monetizing climate actions. These findings reinforce

the importance of embedding sustainability practices into operational strategies for long-term corporate resilience and value creation.

Recommendations

Based on the findings, the following recommendations were made:

- i. Firms should invest in energy efficiency technologies to lower costs and improve profitability.
- ii. Stronger water management frameworks should be adopted to enhance community trust and resource stewardship.

Perception of Business Education Students on Content Coverage of Center for Entrepreneurial Studies in Delta State University, Abraka

EDIONWE, Nosakhare
Department of Business Education
Delta State University, Abraka
enosakhare@delsu.edu.org

Publication Date: 2025/11/28

Abstract

The study assessed business education students' perception on content coverage of center for entrepreneurial studies in Delta State University, Abraka. The role of the study is to determine if there is any significant relationship between students' mean score on theoretical entrepreneurial knowledge and practical entrepreneurship knowledge. Three research question were raised to guide the study as well as two hypotheses were formulated for the study. The study adopted a descriptive survey design. The population comprises of 417 students of business education during the 2024/2025 academic session of Delta State University, Abraka. The sample comprised of randomly selected 90 students. A structure questionnaire containing 24 questions made to collect data. Data collected was analyzed using mean gain, while hypotheses was tested using t-test at 0.05 level of significance. The study revealed that content coverage of center for entrepreneurial studies is both theory and practical oriented, though the findings gave upper hand to the practical aspect. The researcher recommended among other that government should adequately support graduate with capital since practical knowledge of their area of study can get them started, students should not relent in venturing into self-business after graduation and should not wait for white cola job.

Keywords: Business Education, Content Coverage, Entrepreneurial Studies

Introduction

The competitive nature of securing jobs in 21st century has transformed intuitions in developing skilled centers for students to acquired relevance skills, knowledge and competencies required to be gainfully employed or be self-reliance. Nigeria is accountable for half of the population and more than two third of the output of West Africa. She is blessed with millions upon millions of acres of cultivatable land, possesses about 38.5 billion barrel of state oil reserves, very great portion of gas reserves, varieties of unexploited mineral, adding to a very large asset of human capital because of its estimated statistics of over one hundred and fifty million. This could be traced from inadequate entrepreneurial knowledge exhibited by both present and pass leaders. Our education most seeks to impact adequate knowledge of entrepreneurship education on our young generation (Nosakhare, 2013).

Entrepreneurial development is characterized by innovation, risk taking and essential factor of a nation's ability to succeed in dynamic and more competitive global market force. It is the capacity and willingness to undertake conception, organization and management

of a productive venture with all co-occurrence risks while making effort to make profit as a reward. An entrepreneurial process involves all functions, task, and specialized actions associated with perceiving opportunities and developing something new and assuming the risks and rewards (Hisrich and Peters, 2002).

Shane (2003) described entrepreneurship as a process that involves seven different stages which are: existence of opportunity, discovery of opportunity, decision to exploit opportunity, resource acquisition, entrepreneurial strategy, organizing process, performance. Entrepreneurial development is about regard through healthy and see as reference point against which other things will be evaluated in business. This is based on activities and change, entrepreneurial skill is also defined as the willingness and ability of a person, or a firm or an organization to see environmental change as an opportunity and use factors of production to produce new goods and services which can occur in a new or an already existing business. Entrepreneurship is the practice of taking ideas and

inventing an organization for developing the ideas (Shane, 2003).

Studies had showed that early knowledge have a way of producing better performance and breakthrough, Berglung and Wennberg (2006) conducted a study on creativity among entrepreneurship students. The study uses a personality test and open-ended interviews to explore creativity between two groups of entrepreneurship masters' students: one at a business school and one at an engineering school. These findings indicate that both groups had high creative potential, but that engineering students channeled this into practical and incremental efforts whereas the business students were more speculative and had a clearer market focus. Biais & Perotti, (2008), studies how early-stage new ideas are turned into successful businesses. They argued that promising ideas can be unprofitable if they fail on one dimension, such as technical feasibility, correspondence to market demand, legality, or patentability. Adequate entrepreneurship knowledge is, therefore, necessary for Nigeria to fight and avoid economic recession.

Ediagboya (2024) stressed that entrepreneurship knowledge or education is an expected learning outcome that will equip the students with the skills to be self-reliant and task the government and other education stakeholders should make sure that educational programme at all levels of education is made relevant to provide the youths and graduates needed entrepreneurial skills. Entrepreneurship education in the narrower sense follows a direct approach, developing students' competencies and entrepreneurial intentions towards starting a business as a career option. According to Paul (2005), the objective of entrepreneurship knowledge or education include to: offer functional education to youth to make self-employed and self-reliant, provide youth graduates with adequate training to them creative and innovative in identifying novel business opportunities and establish a career in small and medium scale businesses, reduce high rate of poverty and rural-urban migration, create employment and serve as a catalyst for economic growth and development among others which averting economic recession is one. According to Central Bank of Nigeria (2021) economic recession is a business cycle contraction, and it refers to a general slowdown I economic activity for two consecutive quarters. GDP is the market value of all legitimately recognized final goods and services produced in the country in a given period of time, usually one year.

Specifically, recession have negative consequences. CBN (2021) cited the following as the effects of economic recession. When household income is cut as a result of economic slowdown, they reduce their demand for goods and services. The experience of the recent GFC showed that many businesses such as Bank

of America, Lehman brothers in America to some local banks in Nigeria were affected. Recession affects both small and large business.

As revenues decline on the statutory reports of businesses, lower dividends are declared. This will depress the price of stocks in the market. The incidence that happened when share prices crashed across the world during the GFC may not be blamed entirely on this factor; however, this is partly responsible for the event. So many businesses lost their viabilities because of the risks they were carrying at the moment. When dividends fall or vanish, it creates other problems such the sacking of the board of directors and senior management of the company. The advertising/marketing unit may be affected, creating unemployment problem for the economy. When the manufacturer's stock falls and the dividends decline or stop, institutional investors, holding the stock may sell and reinvest the proceeds into better performing stocks. This will further depress the company's stock price and affect the entire equities market and the cycle continues of the economic.

Economic recession also has effect on the ability of customers to pay their debt to the creditors, leading to growing non-performing loans (NPL). In the heat of the GFC, so many subprime debts went bad, thereby impairing a result so many banks went bankrupt. Also, when debtors are not able to repay their debts, companies? Ability to repay their creditors is hampered as a result of falling revenues. This leads to default in paying interest and the principal. The resulting consequence is debt downgrade and rescheduling. In the process, investors will lose confidence in the company and the company may not be able to raise money from the capital market again. When the source of funding ceases, the business will fold up resulting in employee lay-off, and increasing unemployment in the economy may lead into recession.

Recession affects the revenue of firms, and by extension, profitability. In an effort to cut costs and improve its bottom line, the company could compromise product quality and, in the process, lose its market share. A baker may offer the same loaf of bread at the same price but reduce major ingredients such as milk, butter, etc. Recession could force airlines to lower their maintenance standards reduce to break even. They may cut flight to routes that are not profitable and frequently cancel flights when there are insufficient passengers for a particular flight. This could cause some inconvenience to passengers, leading to economic loss.

There are lots of literatures on what entrepreneurship is all about. Ediagboya (2024) regards entrepreneurship as the conception and operation of one's own business. Ediagboya (2024) also regards it as conception, construction and allocation of resource of value from

virtually low to individual, organization, groups and society. He concluded by stating that it entails setting up and organizing small business ventures by mobilizing people and resources to meet people's desires. The changeable world and the fact that entrepreneurship is studies in different disciplines make its definition unclear. Ediagboya (2024) wrote that entrepreneurship is discovering new business possibilities in the market which can be individual or people who start business based on an entirely new products or services; also, establishment of more handicraft or services-oriented business with more imitative products and services. Ediagboya et al (2024) described entrepreneurship as a process that involves seven different stages which are: existence of opportunity, discovery of opportunity, decision to exploit opportunity, resource acquisition, entrepreneurial strategy, organizing process, performance.

The history of economic recession is as old as the history of humanity itself, dating back to the 3rd Century. This was the period of a Military Anarchy also known as imperial crisis (AD235-284), during which the Roman Empire came close to collapse life depression, civil crisis, invasion and diseases. The crisis culminated in the assassination for Emperor Alexander Severus by his own troops, resulting in the competition his successor. Consequently, the Empire split into three competing states by AD254-260 (CBN,2021). Economic recession is a period of general economic decline and is typically accompanied by a drop in the stock market, an increase in unemployment, and a decline in the housing market. Generally, recession is less severe than a depression. The blame for a recession generally falls on the federal leadership, often either the president himself, the head of the Federal Reserve, or the entire administration.

Statement of the Problem

The place of entrepreneurship knowledge cannot be overemphasized due to the place knowledge occupied in success and breakthrough of any prospective or existing system. The extent to which entrepreneurship is taught in school is the major problem, students lack adequate knowledge of entrepreneurship, even when they tend to know about entrepreneurship, it is theory based, not practical as observed by the researcher. However, it was observed also that center of entrepreneurial studies does not align the practical and theoretical knowledge to the understanding of business education students. This becomes an issue that bordered the researcher to assess the 'perception of business education students on content coverage of center of entrepreneurial studies' in Delta State university, Abraka.'

Purpose of Study

The main purpose of study is to assess perception of business education students on content coverage of center of entrepreneurial studies in Delta State university, Abraka. Specifically, the study intends to:

Find out students' perception on the content coverage of center of entrepreneurial studies in business education programme.

Ascertain students' perception on role of center of entrepreneurial studies as a pathway out of present and future economic recession.

Research Questions

The following research questions were raised for the study.

What is the perception of students on the content coverage of center for entrepreneurial studies in business education programme?

What is the role played by center for entrepreneurial studies in the present and future economic recession?

Research Hypotheses

The following null hypotheses were formulated to guide the study at 0.05 level of significance.

There is no significant gender difference in the mean response of student on their perception of the content coverage of center for entrepreneurial studies in business education programme.

There is no significant gender difference in the mean response of student on whether center for entrepreneurial studies can be a way out of present and future economic recession.

Methodology

The study adopted a descriptive survey research design. The population comprises of 417 100-300 level students of business education 2022/2023 academic session of Delta State University, Abraka. The sample comprised of randomly selected 90 students. This set of students were used because they have been taught entrepreneurship and had gotten acclimatized with the school system compared to other level of business education student. A structure questionnaire containing 24 items used for data collection. Data collected was analyzed using mean, while the hypotheses tested using t-test at 0.05 level of significance. The decision rule will be based on 4-point liker scale. A mean above 2.5-4 will be accepted while mean ranging from 1-2.4 will be rejected.

Results and Discussions

To present and analyze the research questions, mean was employed. Mean scores of business education students were presented and analyzed. The results are shown in Table 1 and 2.

Research Question One

What is the perception of students on the content coverage of center of entrepreneurial studies in business education programme?

Table 1: Mean Scores business education students' responses on perception of students on the content coverage of center of entrepreneurial studies in business education programme

S/N	Questionnaire Item	Mean	Decision
1	I recall theoretical entrepreneurship knowledge	3.31	Accepted
2	I theoretically recite my entrepreneurship know-how	2.88	Accepted
3	I practically apply my entrepreneurship know-how	3.00	Accepted
4	I practically demonstrate entrepreneurship skill	3.14	Accepted
5	Content coverage of entrepreneurship education is theoretically covered	2.94	Accepted
6	Content coverage of entrepreneurship education is practically oriented covered	3.02	Accepted
7	Teacher adequately covers the practical aspect of entrepreneurship	3.04	Accepted
8	Teacher adequately covers the theory aspect of entrepreneurship	3.13	Accepted
Grand Mean		3.06	Accepted

Table 1 revealed student's perception on content coverage is positive. Grand mean of 3.06 strongly indicated that center of entrepreneurial studies content adequately covers the expected learning outcome to make a student entrepreneur or to survive without searching for white collar job. It also implies that the content coverage covers both theoretical and practical aspect of business education programme

Research Question Two

What is the role center of entrepreneurial studies plays in the present and future economic recession?

Table 2: Mean Gain Scores of business education students on the role of center of entrepreneurial studies as a pathway out of present and future economic recession

S/N	Questionnaire Item	Mean	Decision
1	It builds manpower base towards attaining national development operations	3.50	Accepted
2	It provides skills and information required to enter into work	3.53	Accepted
3	It empowers youth to work for themselves or create jobs for others	3.61	Accepted
4	It builds human capital prepared for current and future labour demand	3.34	Accepted
5	It building manpower base for natural development and enhance our attaining of set vision		Accepted
Grand Mean		3.44	Accepted

Table 2 revealed student's perception on center of entrepreneurial studies as a pathway out of present and future economic recession. Grand mean of 3.44 strongly indicated that center of entrepreneurial studies plays a vital role in bring Nigeria out of her present and future economy recession. It also implied that the respondent's perception is strong on the need for center of entrepreneurial studies to equipped students with job skills.

Test of Hypotheses

Hypotheses One

There is no significant gender difference in the mean response of student on their perception of the content coverage of center of entrepreneurial studies in business education programme.

Table 3: t-test on gender difference of students mean response on their perception of content coverage of center of entrepreneurial studies in business education programme.

Variables	Gender	N	Mean	SD	Df	t-cal	t-crit	Sig	Decision
Perception of students on content coverage	Male	27	31.96	0.51	88	10.00	1.96	0.00	Rejected
	Female	63	21.44	5.23					

Table 3 showed that calculated t-value of 10.00 was greater than critical value of 1.96 at 0.05 level of significance. Since the calculated t-value of 10.00 greater than critical value of 1.96, null hypothesis was

rejected. This implied significant difference between reception of male and female on content coverage of center of entrepreneurial studies in business education programme.

Hypotheses Two

There is no significant gender difference in mean response of student on whether center of

entrepreneurial studies can be a way out of present and future economic recession.

Table 4: t-test on gender difference of students mean response on whether center of entrepreneurial studies can be a way out of present and future economic recession.

Variables	Gender	N	Mean	SD	Df	t-cal	t-crit	Sig	Decision
Role of center of entrepreneurial studies	Male	27	20.00	4.06	88	8.42	1.96	0.00	Rejected
	Female	63	16.05	2.43					

Table 4 showed that the calculated t-value of 8.42 was greater than critical value of 1.96 at 0.05 level of significance. Since the calculated t-value of 8.42 is greater than critical value of 1.96, null hypothesis was rejected. This implied significant difference between mean response of male and female respondents, in favour of the female.

Findings of the Study

The following were raised from the findings of the study:

1. The content coverage of center of entrepreneurial studies is both theoretically and practically oriented, though the findings gave upper hand to the practical aspect.
2. Center of Entrepreneurial Studies can be a way out of present and future economic recession as shown in the gender comparison on their reaction to research question 3.

Discussion of the Findings

The data collected, presented and analyzed shows that there exists significant difference in students' theoretical center of entrepreneurial studies and practical entrepreneurship knowledge of business students, which is in favour of practical entrepreneurship knowledge, there exist significant relationship between what students can produce with center of entrepreneurial studies and the content coverage of entrepreneurship education whether theory or practical and there also significant gender difference between the students mean response on whether Center of Entrepreneurial Studies can be a way out of present and future economic recession. This is in agreement to Edigboya (2024) who involves seven different stages which are: existence of opportunity, discovery of opportunity, decision to exploit opportunity, resource acquisition, entrepreneurial strategy, organizing process, performance. This supported the findings that Center of

Entrepreneurial Studies content coverage is all encompassing.

It may be concluded that students are inculcated with center of entrepreneurial studies which in turn could be a way out of economic recession. The student will diversify after graduated and be self-reliance instance of waiting for white collar job. Both research question one show adequate grasp of practical entrepreneurship knowledge than the theoretical which is agreement with research question two that also indicated a higher mean on what students can produce with their entrepreneurship knowledge. The results are in consonance with the findings of Arogundade (2011) who stressed that entrepreneurship knowledge or education is an expected learning outcome that will equip the students with the skills to be self-reliance and task the government and other education stakeholders maintain educational programme at all levels of education are made relevant to provide the youths and graduates needed entrepreneurial skills. Absence of the knowledge is negative CBN (2021) emphasized family incomes to cut down, showing result of economic downness, reducing demand for goods and services. Low demand from family, establishment reduce production of certain goods and services to cut cost and profit will decline. Hence, consequence of production fall, workers laid off, reduction in buying of new equipment, less funding for research and development, lower new product rollouts and general business activities collapse.

Conclusion

The study therefore concludes that since according to the findings of this study, knowledge is measured by what the recipient can produce. Attention if given to developing the individual practical acquisition of knowledge will go a long way in alleviating poverty and creating job for our graduates. If our graduates are adequately established and can compete with their counterpart in other country it will go a long way in bringing us out of the recession, since economic recession

can also be measure by the number or rise in unemployment, self-employment eventually becomes its antidote.

Recommendations

The following recommendation were made:

1. Government should adequately support graduates with capital since the practical knowledge of their area of study can get them started.

Performance Management And Sustainable Growth Of Deposit Money Banks In Delta State, Nigeria

ADISE, Adaeze Toniafranklyn
Department of Business Administration,
Faculty of Management Sciences,
Delta State University Abraka,
Delta State, Nigeria
Youngtonia18@gmail.com
adaezeadise@delsu.edu.ng

Publication Date: 2025/11/28

Abstract

This study investigated the impact of performance management on the sustainable growth of deposit money banks in Delta State, Nigeria, using Strategic Goal Cascade (SGC), Target-Setting Fairness and Clarity (TSFC), Appraisal Process Quality (APQ), and Feedback Culture and Coaching (FCC) as proxies of performance management. A descriptive survey research design was adopted, and data were collected through structured questionnaires administered to employees of ten selected banks located in Asaba, Warri, and Ughelli. A total of 385 questionnaires were distributed, with 349 valid responses retrieved, representing a response rate of 90.65 percent. Reliability was confirmed through Cronbach's alpha values above 0.70 for all variables, and content validity was established through expert review. Data were analyzed using descriptive statistics and multiple regressions in SPSS version 23. The findings revealed that all four dimensions of performance management had significant positive impacts on sustainable growth. Specifically, SGC ($B = .117, p < .05$), TSFC ($B = .143, p < .05$), APQ ($B = .114, p < .05$), and FCC ($B = .972, p < .05$) were all significant predictors, with TSFC showing the strongest effect. These results confirm that transparent target-setting, structured goal alignment, quality appraisal processes, and constructive feedback mechanisms are vital drivers of long-term sustainability in banking institutions. The study concludes that sustainable banking performance depends heavily on internal performance management systems, reinforcing Goal-Setting Theory. It recommends that banks strengthen goal cascade models, adopt participatory and transparent target-setting practices, improve appraisal fairness and timeliness, and embed coaching and mentoring mechanisms into performance management cycles. The study provides theoretical, practical, and policy implications for enhancing the sustainability of the Nigerian banking sector.

Keywords: *Strategic Goal Cascade, Target-Setting Fairness. Clarity, Appraisal Process Quality, Feedback Culture and Coaching*

Background to the Study

In the global banking industry, performance management systems (PMS) have increasingly been recognized as key drivers of sustainable growth. Strategic goal cascade (SGC), which ensures the alignment of corporate objectives with branch and individual targets, has been shown to enhance organizational coherence and efficiency in resource allocation. Target-setting fairness and clarity (TSFC) is widely associated with employee motivation, trust, and engagement, all of which contribute to long-term institutional resilience. Furthermore, appraisal process quality (APQ) and feedback culture & coaching (FCC) are critical to driving employee development,

productivity, and adaptability in dynamic financial markets (Sethi, 2025). However, much of the global discourse has been dominated by quantitative financial measures of growth, with relatively limited integration of these qualitative PMS dimensions into sustainability frameworks (Zainuddin & Osman, 2023).

Across Africa, banks continue to face volatile economic conditions, regulatory reforms, and competition from fintechs, which heighten the importance of robust PMS. Studies have revealed that strategic alignment and fair performance appraisal processes improve employee commitment, thereby strengthening banks' capacity to adapt to turbulence (Mungai & Wambugu, 2023). Feedback culture and

coaching have also been identified as essential mediators of employee productivity and service delivery in African banks (Adebayo & Lawal, 2024). Evidence from Kenya, South Africa, and Ghana demonstrates that fairness and transparency in target-setting, alongside effective feedback mechanisms, foster employee trust and reinforce customer service, ultimately supporting sustainable growth (Chigora et al., 2023). These findings highlight that PMS dimensions such as SGC, TSFC, APQ, and FCC are not peripheral but essential in shaping banking resilience on the continent.

In Nigeria, the banking sector occupies a critical position in driving economic development, but it is confronted with numerous challenges, including inflationary pressures, exchange rate fluctuations, regulatory tightening, and increasing digital disruption. Sustainable growth for deposit money banks is not merely about profitability but also about resilience, innovation, ethical compliance, and customer retention. While studies have examined sustainability reporting and corporate governance practices in Nigerian banks, relatively fewer have explored the role of qualitative PMS dimensions in achieving sustainable growth (Tomomewo et al., 2022). Research by Achara, Ezichi-Obasi, and Ufomba (2024) found that appraisal systems incorporating clear criteria, performance measurement, and constructive feedback positively influence employee performance in Nigerian banks, though the direct link to sustainable growth remains underexplored. Similarly, Nguemo and Ekokotu (2025) emphasized that technology investment enhances sustainable growth in Nigerian deposit money banks, but cautioned that internal management practices, particularly PMS, serve as mediating factors.

Recent findings in Nigeria further indicate that aligning individual objectives with corporate strategy through SGC improves organizational performance, while fairness in target-setting strengthens employee engagement and retention (Okonkwo & Nwankwo, 2023). Moreover, APQ and FCC have been shown to play critical roles in enhancing staff competence, reducing turnover, and supporting ethical risk-taking, all of which are crucial for sustainability in the financial services sector (Olowofela & Akinola, 2025). However, despite these insights, there is limited empirical evidence connecting these four PMS proxies; SGC, TSFC, APQ, and FCC directly with sustainable growth in deposit money banks, especially within Delta State. Given the unique socio-economic landscape of Delta State, characterized by oil-driven economic volatility, urban-rural banking diversity, and rising customer expectations, examining these qualitative PMS measures offers both scholarly and practical value. Such an inquiry will not only bridge existing research gaps but also provide actionable insights for

strengthening the resilience and growth trajectory of Nigerian banks.

Statement of the Problem

Globally, performance management systems have been recognized as mechanisms that align employee efforts with organizational objectives, yet much of the evidence has focused on financial outcomes rather than sustainable growth dimensions. In Africa, while strategic alignment, appraisal quality, and feedback practices are acknowledged as enablers of employee productivity, studies remain fragmented and seldom integrate these qualitative proxies into sustainability models. Within Nigeria, the banking sector continues to face economic volatility, regulatory pressure, and technological disruption, all of which necessitate robust management practices. However, most existing studies have concentrated on financial performance and sustainability reporting, leaving limited attention to how qualitative measures such as strategic goal cascade, fairness in target-setting, appraisal process quality, and feedback culture directly influence sustainable growth in deposit money banks. Particularly in Delta State, where deposit money banks operate within socio-economic contexts of urban-rural diversity and high customer expectations, empirical evidence is scarce. This gap creates uncertainty on whether these performance management proxies significantly predict sustainable growth outcomes. Hence, the need arises for a study grounded in quantitative methods such as Ordinary Least Squares (OLS) regression, to establish causal inferences and provide evidence-based insights on how these dimensions of performance management impact the sustainability trajectory of banks in the region.

Objectives of the Study

The main objective of this study was to examine the impact of performance management on the sustainable growth of deposit money banks in Delta State, Nigeria. The specific objectives were to:

- i. determine the extent to which strategic goal cascade influenced the sustainable growth of deposit money banks in Delta State.
- ii. assess how target-setting fairness and clarity affected the sustainable growth of deposit money banks in Delta State.
- iii. evaluate the influence of appraisal process quality on the sustainable growth of deposit money banks in Delta State.
- iv. ascertain how feedback culture and coaching shaped the sustainable growth of deposit money banks in Delta State.

Research Questions

- i. To what extent did strategic goal cascade influence the sustainable growth of deposit money banks in Delta State?
- ii. How did target-setting fairness and clarity affect the sustainable growth of deposit money banks in Delta State?
- iii. To what extent did appraisal process quality impact the sustainable growth of deposit money banks in Delta State?
- iv. How did feedback culture and coaching contribute to the sustainable growth of deposit money banks in Delta State?

Research Hypotheses

H0₁: Strategic goal cascade had no significant impact on the sustainable growth of deposit money banks in Delta State.

H0₂: Target-setting fairness and clarity had no significant effect on the sustainable growth of deposit money banks in Delta State.

H0₃: Appraisal process quality had no significant influence on the sustainable growth of deposit money banks in Delta State.

H0₄: Feedback culture and coaching had no significant impact on the sustainable growth of deposit money banks in Delta State.

Literature Review

Conceptual Review

Performance management

Performance management had been widely regarded as a critical tool for ensuring organizational efficiency and long-term sustainability in financial institutions. In the context of deposit money banks, performance management served as a structured approach for aligning individual performance with strategic goals, thereby enhancing organizational outcomes. Scholars had emphasized that effective performance management encompassed target-setting, monitoring, evaluation, and feedback mechanisms that motivated employees while promoting accountability (Adebayo & Lawal, 2024; Zainuddin & Osman, 2023). Within Nigerian banks, the role of performance management was even more pressing due to the dynamic macroeconomic conditions and regulatory requirements that demanded adaptive and results-oriented practices. A growing body of literature had suggested that strategic alignment and goal cascading were fundamental to performance management, particularly in banking institutions. When organizational objectives were translated into departmental and individual goals, employees reportedly demonstrated higher levels of clarity and commitment to achieving set targets (Okonkwo & Nwankwo, 2023; Mungai & Wambugu, 2023). In the Nigerian banking sector, where competition was intense, such alignment was argued to

reduce internal inefficiencies and promote consistency in service delivery, thereby reinforcing overall bank stability.

Equally important, fairness and clarity in target-setting had been recognized as determinants of employee satisfaction and trust in the performance management process. Studies noted that employees perceived target-setting processes as credible when they were transparent, realistic, and participatory, which in turn enhanced motivation and reduced workplace conflicts (Sethi, 2025; Chigora et al., 2023). In Nigerian banks, where performance pressure was often high, clarity in expectations reduced resistance and turnover intentions while promoting accountability and commitment. Appraisal process quality was also central to performance management in financial institutions. Research had shown that timely, evidence-based, and objective appraisals promoted fairness, reduced bias, and improved employee engagement (Achara et al., 2024; Olowofela & Akinola, 2025). In Nigeria, where appraisal systems were sometimes criticized for subjectivity, improved quality in appraisal processes had been linked to increased employee trust in management and more effective career development planning. Consequently, appraisal quality was argued to be positively associated with organizational resilience and customer satisfaction. Feedback culture and coaching were highlighted in recent scholarship as mechanisms that reinforced continuous learning and adaptability in banks. Constructive feedback not only closed performance gaps but also encouraged innovation and accountability (Adebayo & Lawal, 2024; Zainuddin & Osman, 2023). Coaching, as an extension of feedback, had been associated with employee development and retention, both of which were critical in Nigeria where banks were increasingly reliant on human capital for competitive advantage. These practices reportedly fostered positive workplace climates, which supported employee productivity and, by extension, sustainable banking growth.

Thus, performance management was further influenced by digital transformation and regulatory oversight. Studies revealed that banks had been compelled to integrate digital tools into appraisal, monitoring, and reporting processes, which enhanced transparency and efficiency (Nguemo & Ekokotu, 2025; Tomomewo et al., 2022). Moreover, regulatory guidelines from the Central Bank of Nigeria had required stricter accountability frameworks, which made performance management an indispensable governance mechanism for deposit money banks. Together, these developments underscored the significance of qualitative aspects of performance management; strategic goal cascade, fairness in target-setting, appraisal quality, and feedback culture as integral to the sustainability of Nigerian banks.

Sustainable Growth

Sustainable growth had been described as the ability of financial institutions to maintain consistent performance while ensuring resilience, innovation, and social responsibility. In global discourse, sustainable growth in banking went beyond profitability to include ethical conduct, environmental awareness, and customer-centered strategies, positioning it as a balance between financial stability and stakeholder interests (Ahmed & Suleiman, 2023; Mensah & Amponsah, 2022). In Africa, sustainable growth was linked to financial inclusion, corporate governance reforms, and risk management. Studies showed that banks pursuing inclusive practices and technological innovation achieved stronger operational resilience and community trust, reinforcing long-term competitiveness (Akinyemi & Ajayi, 2024; Chukwu et al., 2023). These findings underscored the need to integrate social and governance dimensions into banking strategies. Within Nigeria, sustainable growth became more pressing amid inflation, currency volatility, and regulatory changes. Evidence suggested that deposit money banks achieved profitability but struggled with sustaining growth under these pressures. Stable earnings, customer retention, and responsible governance were critical in maintaining resilience (Okeke & Ibeh, 2023; Ojo & Yusuf, 2025). Furthermore, leadership transparency and ethical practices enhanced long-term growth, positioning governance and human capital as central to sustainability (Oladipo et al., 2022; Eze & Ananwude, 2023).

Theoretical Review

Goal-Setting Theory

The present study was anchored on Goal-Setting Theory, which emphasized that specific, clear, and challenging goals motivated higher performance compared to vague or easy objectives. The theory posited that individuals exerted greater effort when they understood the relevance of their tasks to broader organizational goals, and when the targets set were perceived as fair, transparent, and attainable. In the context of deposit money banks, strategic goal cascade reflected the operationalization of this theory, as corporate goals were broken down into departmental and individual objectives, ensuring alignment and coherence across the institution. Similarly, target-setting fairness and clarity directly aligned with the theory's assertion that clarity and perceived equity enhanced employee commitment and reduced resistance to performance targets (Locke & Latham, 2020; Akinyemi & Ajayi, 2024).

Furthermore, appraisal process quality and feedback culture were supported by the theory's assumption that performance improved when individuals received

continuous evaluation and constructive feedback on progress toward set goals. Feedback not only reinforced accountability but also acted as a motivational driver for sustained performance, while coaching ensured capability development (Chigora et al., 2023; Okeke & Ibeh, 2023). When extended to organizational outcomes, Goal-Setting Theory suggested that effective performance management practices ultimately translated into higher productivity, customer satisfaction, and long-term sustainable growth. This linkage justified the use of Goal-Setting Theory as a foundation for examining how performance management systems influenced sustainability in Nigerian deposit money banks.

Empirical Review

Olowofela (2025) investigated sustainable banking and bank stability in Nigeria between 2012 and 2022. The objective was to examine whether governance, social, and environmental practices influenced stability. Using Dynamic Ordinary Least Squares analysis, findings revealed that governance dimensions significantly contributed to stability, while environmental and social dimensions showed mixed effects. The study concluded that sustainability depended heavily on internal management practices and recommended aligning performance management systems with sustainable banking frameworks.

Ehimem and Ogundare (2024) explored performance management systems and organizational performance of deposit money banks in Delta State. The study sought to identify which dimensions of performance management most influenced organizational outcomes. Questionnaires were distributed to bank staff across three major cities, and data were analyzed with multiple regression. Results showed that strategic goal cascade and appraisal process quality were significant predictors of sustainable performance, while feedback enhanced outcomes indirectly. The study concluded that integrated PMS approaches were more effective than isolated measures and recommended formalized goal cascade models and feedback dashboards.

Effiong (2024) assessed the effect of managerial coaching on employee performance in commercial banks in Calabar. The objective was to determine how feedback and support practices influenced innovative and in-role performance. Data collected through a structured questionnaire were tested using regression and mediation analysis. Findings indicated that managerial coaching significantly enhanced both role performance and innovation, with role clarity mediating the relationship. The study concluded that feedback and coaching mechanisms promoted growth and recommended embedding coaching in appraisal systems.

Okafor and Eze (2024) examined performance management and organizational sustainability in public sector organizations in South-East Nigeria. Although outside the banking sector, the objective was to test if PMS influenced sustainability outcomes. Using questionnaires and regression analysis, the study found that goal clarity, timely appraisals, and feedback culture significantly influenced sustainability. It concluded that PMS proxies were critical across sectors and recommended applying similar practices in banking.

Adegbite and Akinola (2024) evaluated the soundness of Nigerian deposit money banks using OLS and IMF Bankometer approaches between 2013 and 2022. The objective was to assess determinants of financial soundness as proxies for sustainability. Findings revealed that management efficiency and risk-related indicators were crucial predictors of soundness. The study concluded that performance management processes underpinned soundness and recommended embedding risk-awareness into goal-setting and appraisal systems.

Okolo, Ikpo, and Ifediora (2024) studied customer feedback management and its effect on customer satisfaction in deposit money banks in South-East Nigeria. The study used a survey and regression analysis to test the relationship. Findings indicated that customer feedback management strongly and positively predicted customer satisfaction. The study concluded that feedback mechanisms enhanced customer trust and recommended integrating complaint resolution speed into staff KPIs.

Akanbi, Ojo, and Lawal (2024) examined employee relations, ethical orientation, and job performance in commercial banks in Lagos. The objective was to determine how fairness and ethical practices shaped employee outcomes. Using a survey design and OLS regression, the study revealed that transparent target-setting and fair appraisals significantly improved employee performance and reduced turnover intentions. It concluded that fairness and ethical orientation were essential to PMS and recommended stronger communication practices.

Adeyemi and Bello (2024) carried out a comparative assessment of Nigerian banks between 2005 and 2015 with the objective of benchmarking drivers of performance. A panel design was adopted, and performance ratios were analyzed alongside management quality measures. Results highlighted that internal management and appraisal systems differentiated sustainable performers. The study concluded that consistent monitoring and appraisal were vital for long-term performance and recommended continuous capacity building for bank managers.

Abu (2023) analyzed the relationship between financial stability, sustainability, and commercial banking performance in Nigeria. The study used secondary macro-banking data with econometric analysis to test how internal practices related to stability. Findings showed that governance and disciplined internal management were critical to sustainable performance. It concluded that performance management practices, particularly fair appraisals and clear goals, were essential to sustaining long-term growth and recommended integrating risk-based KPIs into performance evaluations.

Onu (2022) examined how performance management practices influenced corporate success among banks in Owerri. The objective was to evaluate the impact of structured goal-setting, appraisal, and feedback mechanisms on organizational outcomes. A survey research design was employed, with data collected through questionnaires and analyzed using regression models. Findings revealed that transparent target-setting and consistent appraisals had significant effects on bank performance, while feedback reinforced employee commitment. The study concluded that banks needed to institutionalize participatory target-setting and recommended manager training in coaching techniques to sustain growth.

Odunayo (2022) investigated performance evaluation and employee productivity in deposit money banks in Lagos State. The study aimed to assess the influence of appraisal quality and target clarity on staff output. Using a survey of bank employees and regression analysis, it was established that appraisal process quality—measured by fairness and timeliness—positively influenced productivity, while inadequate feedback reduced efficiency. The study concluded that effective appraisals were central to employee performance and recommended incorporating feedback mechanisms into appraisal cycles.

Attah-Botchwey (2022) studied sustainability reporting and performance of African listed banks, focusing on the role of governance and disclosure. Panel data from multiple banks over a ten-year period were analyzed using regression methods. Findings indicated that sustainability disclosures had limited impact unless supported by internal goal-setting and appraisal practices. The study concluded that disclosures alone were insufficient and recommended aligning internal PMS practices with sustainability strategies.

Research Methodology

Research Design

The study adopted a descriptive survey research design. This design was considered appropriate because it enabled the researcher to obtain the opinions, perceptions, and attitudes of bank employees on the relationship between performance management

systems and sustainable growth. A survey approach also facilitated the collection of primary data directly from respondents in their natural work environment, which improved the relevance and validity of responses. The design was quantitative in nature, as it emphasized the measurement of variables such as Strategic Goal Cascade (SGC), Target-Setting Fairness and Clarity (TSFC), Appraisal Process Quality (APQ), Feedback Culture and Coaching (FCC), and Sustainable Growth (SG). This approach permitted the use of inferential statistics and Ordinary Least Squares (OLS) regression to examine relationships between explanatory and outcome variables.

Population of the Study

The population of the study comprised all employees working in selected deposit money banks operating in Delta State, Nigeria. Since the study focused on Asaba, Warri, and Ughelli, ten deposit money banks with regional and branch offices in these cities were selected based on their market share and accessibility. The population included managers, supervisors, and operational staff, as they were all involved in the implementation and experience of performance management practices. The breakdown of the study population by bank and location is presented below Table 1 below:

Table 1: Study Population

S/N	Bank Name	Branch Address (Main City)	Estimated Staff Population
1	Zenith Bank Plc	Zenith Bank Rd., Warri	120
2	Guaranty Trust Bank Plc	Okumagba Ave., Warri	105
3	First Bank of Nigeria	Nnebisi Rd., Asaba	140
4	United Bank for Africa	Udu Rd., Warri	110
5	Access Bank Plc	Summit Rd., Asaba	100
6	Fidelity Bank Plc	Effurun-Sapele Rd., Warri	85
7	Union Bank Plc	Okumagba Ave., Warri	90
8	Polaris Bank Plc	Nnebisi Rd., Asaba	95
9	Sterling Bank Plc	Ughelli Main Market Rd.	75
10	Ecobank Nigeria Plc	Ezenei Ave., Asaba	80
Total		1,000	

Source: Banks' HR Departments, 2024.

Sample Size Determination

The sample size was determined using Yamane's (1967) formula for finite population:

$$n = \frac{N}{1 + N(e^2)}$$

Where:

n = sample size

N = population size (1,000)

e = margin of error (0.05)

$$n = \frac{1000}{1 + 1000(0.052)} = \frac{1000}{1 + 25} = \frac{1000}{26} = 384.6 \approx 385$$

85

on of the sample size is presented in Table 2 below:

Table 2: Proportion of the Sample Size

Bank Name	Population	Proportionate Sample (n = 385)
Zenith Bank Plc	120	46
Guaranty Trust Bank Plc	105	40
First Bank of Nigeria	140	54
United Bank for Africa	110	42
Access Bank Plc	100	39
Fidelity Bank Plc	85	33
Union Bank Plc	90	35
Polaris Bank Plc	95	37
Sterling Bank Plc	75	29

Thus, the sample size for the study was 385 employees.

Sampling Techniques

The study employed a proportionate stratified random sampling technique. The population was first stratified according to banks, and the sample size was distributed proportionately to reflect the number of employees in each bank. Within each stratum, respondents were randomly selected to ensure representativeness. The proportion

Bank Name	Population	Proportionate Sample (n = 385)
Ecobank Nigeria Plc	80	30
Total Sample	385 respondents	

Source: Researchers Computations, 2025.

Method of Data Collection

Primary data were collected through the administration of structured questionnaires. The instrument was distributed physically by trained research assistants who visited bank branches. To increase the response rate, questionnaires were delivered during less busy periods such as early mornings and late afternoons. Follow-up reminders were also conducted. Respondents were assured of confidentiality and anonymity, which encouraged honest responses.

Research Instruments

The research instrument was a self-administered structured questionnaire designed on a five-point Likert scale ranging from 1 = Strongly Disagree to 5 = Strongly Agree. The questionnaire was divided into five sections. The first section covered demographic information of respondents while the second section contained items measuring Strategic Goal Cascade (SGC), such as the clarity of cascading goals from top management to employees, Target-Setting Fairness and Clarity (TSFC), focusing on transparency, fairness, and attainability of targets, Appraisal Process Quality (APQ), including aspects such as timeliness, objectivity,

and documentation of appraisals, Feedback Culture and Coaching (FCC), with items addressing frequency, constructiveness, and coaching orientation of feedback and Sustainable Growth, with indicators such as customer retention, innovation, compliance, and stability.

Validity of Research Instruments

Content validity was censured by subjecting the questionnaire to expert review by three academics in business management and two HR professionals from deposit money banks. Their feedback was incorporated to improve the clarity and relevance of the items. Construct validity was established by aligning the items with theoretical constructs from Goal-Setting Theory and Balanced Scorecard perspectives.

Reliability of Research Instruments

Reliability of the instrument was tested using Cronbach's Alpha, with a pilot test conducted on 40 respondents from non-sampled bank branches in Delta State. Results showed all variables had alpha coefficients above the acceptable threshold of 0.70, indicating strong internal consistency.

Table 3: Reliability Instruments

Variable	Number of Items	Cronbach's Alpha
Strategic Goal Cascade (SGC)	6	0.82
Target-Setting Fairness (TSFC)	6	0.79
Appraisal Process Quality (APQ)	7	0.84
Feedback Culture & Coaching (FCC)	7	0.88
Sustainable Growth (SG)	8	0.86

Source: Researchers Computations, 2025.

Method of Data Analysis

Data collected were coded and entered into SPSS version 23 for analysis. Descriptive statistics such as means, standard deviations, and frequencies were used to summarize demographic variables and item responses. Inferential statistics were applied to test hypotheses. Specifically, Ordinary Least Squares (OLS) regression was employed to determine the impact of SGC, TSFC, APQ, and FCC on Sustainable Growth..

The regression model was specified as:

$$SG = \beta_0 + \beta_1 SGC + \beta_2 TSFC + \beta_3 APQ + \beta_4 FCC + \mu$$

Where:

SG = Sustainable Growth (dependent variable)

SGC = Strategic Goal Cascade

TSFC = Target-Setting Fairness and Clarity

APQ = Appraisal Process Quality

FCC = Feedback Culture and Coaching

β_0 = Constant

$\beta_1 - \beta_4$ = Coefficients of regression

μ = Error term

Hypotheses were tested at a 5% significance level.

Coefficient values, t-statistics, and p-values guided the interpretation of results.

Results and Discussion

This section outlines the procedures adopted for data analysis. Descriptive statistics were utilized to condense the dataset and highlight underlying patterns, while a correlation matrix was developed to illustrate the associations among the study variables. To test the research hypotheses, multiple regression analysis was

conducted using SPSS version 23. A total of 385 structured questionnaires were distributed to employees of ten selected deposit money banks located in Asaba, Warri, and Ughelli, Delta State, Nigeria. Delta State was purposively chosen due to its prominence as a commercial hub in southern Nigeria, with Asaba, Warri, and Ughelli serving as focal points for banking operations. Out of the questionnaires distributed, 349

were duly completed and returned, representing an impressive response rate of 90.65 percent. This high level of participation offers a robust basis for statistical analysis and exceeds the benchmark proposed by Cooper and Schindler (2014), who consider a 50 percent response rate sufficient, 60 percent good, and 70 percent or higher excellent.

Table 4: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
SGC	349	11	20	16.87	2.144
TSFC	349	12	20	17.92	2.242
APQ	349	11	20	16.33	1.656
FCC	349	12	20	17.12	2.109
SG	349	12	20	17.24	2.114
Valid N (listwise)	349				

Source: SPSS Version 23 Output, 2025.

The descriptive statistics reveal clear patterns in the responses of the 349 participants whose questionnaires were valid for analysis. The minimum and maximum values indicate that responses spanned broadly across the expected range. The mean values, which lie between 16.33 and 17.92, show that participants expressed strong positive perceptions across all the measured variables. Among these, TSFC recorded the highest mean of 17.92, suggesting that respondents placed the greatest emphasis on the fairness and clarity

of target-setting. SG followed closely with a mean of 17.24, while FCC scored 17.12, both reflecting favorable opinions regarding growth outcomes and feedback practices. SGC and APQ also reported high averages of 16.87 and 16.33 respectively, underscoring positive experiences with goal alignment and appraisal processes. The standard deviations ranged from 1.656 to 2.242, reflecting limited variability and indicating that responses were relatively consistent across participants. These results provide a dependable foundation for further statistical testing

Table 5: Correlations

		SG	SGC	TSFC	APQ	FCC
Pearson Correlation	SG	1.000				
	SGC	.467	1.000			
	TSFC	.365	.432	1.000		
	APQ	.398	.450	.437	1.000	
	FCC	.477	.378	.439	.499	1.000

Source: SPSS Version 23 Output, 2025.

The correlation matrix provides insight into the relationships among the study variables. The results show that SG has positive and statistically meaningful associations with all other variables. Specifically, SG correlates most strongly with FCC at .477, suggesting that feedback and coaching practices have a close link with sustainable growth outcomes. This is followed by a correlation of .467 between SG and SGC, indicating that the alignment of goals with employees contributes positively to growth. The correlations between SG and

APQ (.398) and between SG and TSFC (.365) are also positive, showing that appraisal processes and target-setting practices both support growth, though to a slightly lesser degree. Looking at the inter-variable relationships, APQ demonstrates the strongest connection with FCC at .499, suggesting that effective appraisals are strongly related to feedback practices. Overall, the correlations confirm that all variables are positively related, reinforcing the interconnected nature of the performance management system

Table 6: **Mutiple Regression Analysis Result**
Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	.915	.372		.243	.028

	Total	389.546	349			

a. Dependent Variable: SG

b. Predictors: (Constant), SGC, TSFC, APQ, FCC

Source: SPSS Version 23 Output, 2025.

The multiple regression results provide strong evidence on the contribution of the independent variables to SG. The unstandardized coefficients show that SGC, TSFC, APQ, and FCC each exert a positive effect on SG.

The regression result shows that SGC ($B = .117$, $t = 4.333$, $\text{sig.} = .000$) has a significant positive effect on SG, underscoring the critical role of goal alignment in sustaining banking growth. Goal-Setting Theory posits that clearly defined and well-communicated goals serve as a motivational mechanism, enhancing employee focus and organizational outcomes. This finding aligns with Ehimem and Ogundare (2024), who demonstrated that SGC was a significant predictor of sustainable performance in Delta State banks, and with Okafor and Eze (2024), who found that goal clarity drove sustainability in the public sector. Similarly, Abu (2023) emphasized that disciplined goal management underpins long-term banking stability. Taken together, both theory and evidence affirm that cascading goals from top management to operational staff provides clarity, strengthens accountability, and anchors performance, thereby advancing sustainable growth in deposit money banks.

TSFC ($B = .143$, $t = 5.720$, $\text{sig.} = .000$) demonstrated the strongest statistical effect among the variables, highlighting the importance of fairness, transparency, and clarity in performance target systems. Goal-Setting Theory asserts that employees are more motivated and productive when targets are both specific and perceived as fair, as this enhances commitment and reduces

resistance. This result corroborates Akanbi, Ojo, and Lawal (2024), who found that transparent target-setting improved employee performance while lowering turnover intentions. It also supports Onu (2022), who showed that participatory and transparent target-setting significantly boosted bank performance. Adegbite and Akinola (2024) similarly emphasized that aligning targets with sound management practices fostered financial soundness. By reinforcing fairness and transparency in TSFC, banks can build trust, reduce employee dissatisfaction, and drive long-term sustainability.

APQ ($B = .114$, $t = 3.800$, $\text{sig.} = .002$) also showed a significant positive effect on SG, confirming that timely, objective, and well-structured appraisal processes contribute meaningfully to growth. Goal-Setting Theory links appraisals to feedback loops, where progress monitoring helps refine performance and align efforts with organizational goals. This finding resonates with Odunayo (2022), who established that appraisal quality enhanced employee productivity in Lagos banks, and with Ehimem and Ogundare (2024), who found APQ to be a strong predictor of sustainable banking performance. Adeyemi and Bello (2024) also highlighted appraisal as a distinguishing feature of consistently sustainable banks. Similarly, Okafor and Eze (2024) reported that timely appraisals enhanced organizational sustainability. These studies collectively affirm that effective appraisals are not only evaluative but also developmental, strengthening employee

contribution and embedding accountability that sustains growth.

FCC ($B = .972$, $t = 2.287$, $\text{sig.} = .037$) was statistically significant, though its effect size was comparatively modest. Nonetheless, the result highlights the importance of constructive feedback and coaching in strengthening growth outcomes. Goal-Setting Theory maintains that goal pursuit is reinforced when employees receive continuous feedback, which clarifies progress and energizes effort. This aligns strongly with Effiong (2024), who found that managerial coaching significantly enhanced both role performance and innovation in Calabar banks, with role clarity serving as a mediator. Okolo, Ikpo, and Ifediora (2024) also demonstrated that feedback management directly enhanced customer satisfaction in banks. Onu (2022) confirmed that feedback reinforced commitment, while Odunayo (2022) warned that inadequate feedback undermined efficiency. The combined evidence affirms that FCC enhances motivation, improves customer trust, and fosters innovation, thereby serving as a vital, though sometimes under-leveraged, driver of sustainability in banking institutions.

The model summary reveals an R value of .988, an R Square of .976, and an Adjusted R Square of .964, which demonstrates that 97.6 percent of the variation in SG is explained by the four predictors combined. The Durbin-Watson statistic of 1.785 indicates no major concern with autocorrelation. The ANOVA result shows an F statistic of 596.881 with a significance level of .000, confirming that the overall regression model is statistically significant.

Conclusion and Recommendations

The study examined the impact of performance management on the sustainable growth of deposit money banks in Delta State, Nigeria. Performance management was proxied with four key dimensions: SGC, TSFC, APQ, and FCC. The study concludes that

performance management significantly influences the sustainable growth of deposit money banks in Delta State. All four proxies SGC, TSFC, APQ, and FCC positively contributed to growth, though TSFC emerged as the most influential determinant. The findings validate Goal-Setting Theory, which emphasizes clarity, fairness, feedback, and structured appraisal systems as essential drivers of performance. Importantly, the evidence underscores that sustainable growth in banking is not merely a product of financial strategies but depends heavily on well-structured performance management practices that align organizational objectives with employee efforts. The study recommends that:

- i. Banks should strengthen formal goal cascade models that ensure organizational objectives are clearly communicated across all levels of staff. Regular review meetings, visual goal dashboards, and participatory planning sessions should be institutionalized.
- ii. Transparent communication of performance targets should be prioritized. Banks should engage employees in participatory target-setting processes and adopt ethical guidelines to prevent bias or favoritism. This will enhance fairness perceptions and deepen employee commitment.
- iii. Banks should improve appraisal systems by ensuring objectivity, timeliness, and adequate documentation. Training programs for managers on unbiased evaluation and constructive feedback should be introduced. Appraisals should be positioned as both evaluative and developmental.
- iv. Coaching and mentoring mechanisms should be embedded into performance cycles. Managers should be trained as coaches, and feedback systems should include real-time performance dashboards, regular review sessions, and opportunities for two-way dialogue. This would enhance employee engagement and innovation

Performance Management and Sustainable Organisational Growth in the Public Sector

AGBORO, Deborah

Department of Business Administration

Delta State University, Abraka.

deborahagboro@delsu.edu.ng

Publication Date: 2025/11/28

Abstract

The study explored performance management and sustainable organisational growth in the public sector. To examine the role of performance appraisal systems, training and development, reward and compensation systems, and employee participation/engagement on the sustainable growth of the public sector. The study employed a cross-sectional survey design to examine the relationship between performance management and sustainable growth in selected tertiary institutions in Delta State. Four universities (University of Delta Agbor, Delta State University Abraka, Dennis Osadebay University Asaba, and Delta State University of Science and Technology Ozoro) were purposively selected to capture institutional diversity in size, age, and geographical location. The target population comprised academic and non-academic staff. Data were collected through a five-point Likert scale structured questionnaire. From the 428 questionnaires that were distributed, 400 were valid. Data were coded and analysed using Statistical Package for Social Sciences (SPSS) 25.0. The data were analysed by descriptive statistics, correlation analysis, ANOVA (Analysis of Variance) and Multiple Regression analysis. The results show that sustainable growth in Nigeria's public sector (tertiary institutions) is strongly influenced by training and employee engagement. At the same time, appraisal systems and reward structures are weak contributors to sustainable growth. The recommendations were that management should redesign appraisal systems to be developmental and place strong emphasis on capacity building and participatory management.

Key Words: Performance, Management, Sustainable, Tertiary, Growth

Introduction

Sustainable growth in an organisation means the capacity of organisation to provide quality services, be relevant, gain efficiency, accountability, and public trust in the long run. This includes financial stability, institutional capacity, change adaptability, and effectiveness in service delivery (Aroghene et al., 2024). Sustainable development in the state is not only the performance in the short run, but also the sustainability and the reliability of the governmental institutions in the long run.

The Public Sector is related to institutions in the economy owned and run by the government, whether it is federal, state or local. They offer basic services like healthcare, infrastructure, defence, administration of the population, and education, perhaps. The public sector is not driven by the profit motive like the private sector, but rather social goals of equity, national security, economic stability and social welfare (Adeleke & Ogbonna, 2022). Public

universities/tertiary institutions are educational service providers in the public sector. There are a good number of tertiary institutions in Nigeria. The country has federal as well as state tertiary institutions. The quality of services provided and employee performance are important to the proper functioning of these institutions. Performance management is a process of monitoring, assessing and refining employee performance to meet the necessary objectives. These include: performance appraisal systems, training and development systems, reward and compensation systems and employee participation and engagement (Osibanjo et al., 2020). Against the background of constrained fiscal resources and increasing citizen demands, the pressure on public sector organisations to deliver better services, to reinstate the trust and confidence of the people and to show value-based money is mounting in Nigeria.

In turn, performance management has appeared as a key device that can help to shift bureaucratic routines towards results-oriented governance (Pahos &

Galanaki, 2019). The implementation of the Performance Management System (PMS) Policy by the Federal Government in 2022 was a significant milestone in tying individual, departmental, and ministerial goals into the Medium-Term National Development Plan and budget frameworks. This change highlights the change in activity monitoring to measurable results of the public administration in Nigeria (Office of the Head of the Civil Service of the Federation [OHCSF], 2022).

Despite the fact that Nigeria has officially embraced a PMS system within its government sectors, its performance has been scattered and mostly descriptive. Moreover, issues like poor credibility of appraisal, limited training opportunities, and poor reward systems have continued to affect the performance of the public sector (Adeyi et al., 2018). Reforms may remain rhetorical instead of transformative without an integrated empirical model that connects performance management practices with sustainability outcomes. This paper fills these gaps by focusing on the role of performance appraisal systems, training and development, reward and compensation systems and employee participation/ engagement in the joint contribution to sustainable organisational growth in a case study of the selected Tertiary Institutions in Delta State, Nigeria.

Objectives of the Study

- i. To investigate how performance appraisal systems impact sustainable organisational development in tertiary institutions in Delta State, Nigeria.
- ii. To evaluate how training and development affect sustainable organisational growth in tertiary institutions within Delta State in Nigeria.
- iii. To determine how reward and compensation systems affect sustainable organisational development in tertiary institutions in Delta State, Nigeria.
- iv. To establish the contribution that employee involvement and engagement make to improve sustainable organisational development within the tertiary institutions in Delta State, Nigeria.

Research Hypotheses

H₀₁: The positive impact of the performance appraisal system on sustainable organisational growth in tertiary institutions in Delta State, Nigeria, is insignificant.

H₀₂: Training and development does not have any significant positive effect on sustainable organisational growth in tertiary institutions in Delta State, Nigeria.

H₀₃: Reward and compensation systems do not significantly help towards sustainable organisational growth in tertiary institutions in Delta State, Nigeria.

H₀₄: Employee involvement and engagement do not significantly add to sustainable organisational growth in the tertiary institutions in Delta state, Nigeria.

Conceptual Review

Sustainable Organisational Growth (SOG)

SOG is the capacity of the public sector organisations in Nigeria to consistently provide quality services, be relevant and attain efficiency, accountability and public confidence in the long run. It includes financial stability, the ability of institutions, and their ability to adapt to change, and effectiveness in service delivery (Ren et al., 2023; Aroghene et al., 2025). Sustainable growth within the public sector implies not only short-term results but also the stability and reliability of the governmental establishment on a long-term basis.

Performance Appraisal System(s) (PAS)

PAS is the evaluation of the results of the work of employees with regard to established objectives. Effective appraisal systems in the public sector of Nigeria are helpful in recognising areas of skills shortage, rewarding those who perform well, and rectifying areas of inefficiency. A practical and transparent appraisal system will encourage employees, improve accountability, and align individual interests with the institutional ones. This enhances service delivery and long-term sustainable growth (Aroghene & Obiekea, 2025).

Teaching and Development (TAD)

Training prepares employees with new knowledge, skills and competencies required to perform effectively (Paul & Audu, 2019). The development is aimed at the long-term capacity building and training of workers to take more responsibilities. The biggest issue in Nigeria is the lack of training in its public institutions. Human capital leads to sustainability in organisations through continuous training and professional growth, creating flexibility to changes in policies, and innovation. According to Olanipekun et al (2024), the provision of adequate training and development cannot be compromised when the organisation desires to maintain competent, experienced and qualified employees in an organisation.

Rewards and Compensation Systems (RCS).

This is a form of financial and non-financial rewards which encourage employees to perform. Low morale, brain drain, and corruption have been common phenomena in the Nigerian public sector due to poor reward systems. A practical and rewarding pay system promotes dedication, lowers employee turnover, and enhances their satisfaction (Pahos & Galanaki, 2019). This promotes institutional stability and leads the organisation to achieve sustainable growth. Employee involvement and engagement (EPE) EPE is used to determine the degree of employee participation in decision-making, policy formulation and implementation. Hierarchical structures in most

Nigerian public agencies tend to inhibit employee contribution. Engaged employees feel valued, thereby becoming innovative, owning organisational objectives, and accountable (Imene, 2023). This helps in the successful implementation of the policy and sustainable development.

Theoretical Framework

Three key theories were used to ground this study in explaining the relationship between performance management practices and sustainable growth in organisations: Goal-Setting Theory, Human Capital Theory, and the Resource-Based View (RBV).

Goal-Setting Theory

Locke (1968) and Latham (1990) developed the theory and subsequently added to it. They hypothesised that people work best when presented with specific, challenging and clear goals. The theory highlighted that goals are motivators in that they cause attention, control effort and persistence. It also emphasised how feedback facilitates the process through which people assess their progress and change their strategies. Goal setting has found wide application as the key to performance appraisal systems, employee evaluation, and goal-based incentive systems in organisations.

Goal-setting theory is extremely important in the system of performance appraisal in tertiary institutions. Academic and administrative personnel are more oriented towards institutional priorities when they have quantifiable targets in terms of quality standards of their teaching or research output, or service delivery. Employees can also enhance their performance with time due to the feedback mechanisms incorporated within the appraisal processes. Besides, the theory describes that the level of goal commitment is higher when employees are engaged in target setting. At Delta State higher education institutions, the idea of engaging staff in decision-making and target-setting may likely lead to increased motivation and responsibility, which further solidifies the sustainability of institutional development.

Human Capital Theory

Human Capital Theory, developed by Schultz (1961) and Becker (1964), stated that human investment in terms of education, training and health plays an important role in enhancing productivity and economic development. The theory suggests that employees are a form of capital since the knowledge, skills, and competencies they develop translate into increased efficiency and organisational performance. In higher-level institutions, ongoing training of staff keeps the academics in line with new teaching skills, research and research techniques, as well as technology in teaching, and the administrative staff enhance

efficiency in their services and management skills. The training opportunities or workshops, seminars, and professional development added benefits to the competence of the employees, besides helping in achieving the larger objective of institutional sustainability (Imene & Udjo-Onovughakpo, 2023). This enhances the institution's capacity to deliver quality education, secure finances, and gain a competitive advantage. It also highlighted the multiplier effect of training, since what individuals learn is often not limited to their immediate needs, but instead benefits the organisation as a whole.

Resource-Based View (RBV)

The Resource-Based View (RBV) of the theory of sustained competitive advantage, an original concept of Wernerfelt (1984), and eventually developed by Barney (1991), suggested that organisations would have sustained competitive advantage when they have resources that are valuable, rare, inimitable and non-substitutable (VRIN). The most strategic of these resources is human capital, as the skills, knowledge, and commitment of employees are challenging for competitors to duplicate. Reward and compensation systems and employee engagement strategies are performance management practices that are solidly rooted in RBV. Universities can achieve this by creating reward systems that identify and retain talented workers, which will result in minimised turnover, increased morale, and organisational commitment. In the same way, fostering the involvement of employees in decision-making and institutional governance may facilitate the development of a culture of trust and collective responsibility (Imene, 2023). These practices turn employees into strategic assets that can be directly linked to organisational resilience and sustainable growth rather than being passive observers.

Empirical Review

The authors discovered that organisational sustainability was strongly forecasted using training and development, as Nwachukwu and Chladkova (2023) found. The other close relationship was between reward and recognition with staff retention and performance. The research by Wu and Liu (2023) revealed that PM system changes enhanced accountability, resource distribution, and institutional sustainability within Chinese higher education. The results reflect issues in Nigerian universities. Agwu (2023) studied how performance appraisal systems enhance productivity in the public organisations in Nigeria. The survey with 350 respondents developed the statement that open and equitable appraisal systems were found to promote employee motivation, responsibility, and effectiveness of the organisation to a

great extent. The research confirms that performance management should have appraisal systems as one of its pillars and an essential one in ensuring sustainable development in universities. Sheikh et al. (2022)'s work is based on a mixed-methods research design, incorporating both a systematic literature review and a pilot qualitative investigation with human resource (HR) professionals working in the UK sector of higher education. Their results showed that performance management (PM) continues to become core to university HR activities, especially following calls to accountability, resource limitations, and situational changes in the sector. This study found that most institutions were institutionalising their PM regimes but in uneven ways and emphasised the strategic implications of harmonising PM with the overall institutional objectives. The authors of the analysed research (Adeleke & Ogbonna, 2022) contrasted the answers of 215 lecturers. They concluded that the practices of reward and compensation were very successful in enhancing research and the quality of teaching. However, unequal reward policies had a negative impact on morale. This confirms that reward and compensation are key aspects of sustainable performance in universities. Okafor and Uche (2022) discovered that participatory decision-making and recognition positively correlated with employee engagement, which in turn was positively associated with institutional effectiveness. This paper focuses on the need to involve employees in realising growth. Akinwale and George (2021) examined the effects that training and development have on the performance of staff in Nigerian public universities. In a sample of 400 academic and non-academic staff, it was identified that there was a strong positive association between targeted training programs and employee performance outcomes. The authors made it clear that institutional sustainability is also fueled by continual professional development. Gonzalez and Perez (2021) reviewed 12 Spanish universities and reported that performance-based payment systems were related to research excellence and significant improvements in international ranking. Al Shammari (2021). Conducted survey research among 280 employees working in the Gulf-region public institutions. The findings showed that a greater degree of employee participation increased innovation, service delivery, and continuity of the institution. Osibanjo et al. (2020) evaluated how the compensation structures impact organisational performance in Nigerian public institutions. The results of the survey revealed that performance and fair-based compensation systems have positive effects on employee commitment and service delivery. A cross-country survey of universities in Ghana and Nigeria (Ofori & Asiedu-Appiah, 2020) found that practising PM had a positive impact on the quality of teaching,

commitment to work, and development of the institutions. In their mixed-methods study, Chen and Zhang (2020) determined that performance management mechanisms positively influenced innovation and academic competitiveness of Chinese universities. The authors have highlighted the tradeoff between accountability-inspired PM and developmental PM towards realising sustainable institutional growth. In a survey conducted by Abubakar and Sule (2020), 250 staff respondents reported that frequent training programs positively impacted staff productivity, knowledge retention and organisational efficiency. This proves the importance of training and development as a means of generating sustainable growth. Idowu (2019) investigated performance management within Nigerian higher education regarding its implementation by qualitative interviews and quantitative surveys. It revealed that improperly designed PM systems undermine morale and organisational performance of the staff, whereas effective PM practices do much to ensure sustainable academic performance. An analysis conducted by Brown and Cregan (2019) of universities in Australia has shown that accountability was boosted by performance management systems, but that the systems needed to be supplemented with staff development programs to be long-term sustainable.

Research Methodology

A quantitative cross-sectional survey was used, and the researcher evaluated the relationship between performance management and sustainable growth in Delta State universities. To represent institutional diversity in size, age, and geographical area, four universities (University of Delta Agbor, Delta State University Abraka, Dennis Osadebay University Asaba, and Delta State University of Science and Technology Ozoro) were purposely chosen. The population of interest was academic and non-academic staff, though as the entire population was not accessible to the researcher, due to time limit, the Cochran formula of a large population was used. Consistent with the above, at least 385 respondents would have been needed. This was scaled to 428, representing non-response, to present an average of 107 respondents per university. A stratified random sampling method was adopted to give sufficient representation of academic as well as administrative personnel. The data were collected using a structured questionnaire that included demographic factors, performance management practices, and indicators of sustainable growth, all measured on a five-point Likert scale. Additional key informant interviews were also done with the sampled officials to help with contextual depth. The content validity was achieved by consulting experts, whereas the reliability was assessed by Cronbach's alpha, where the result was above the 0.70 level. The data were coded and analysed

with the Statistical Package for the Social Sciences (SPSS) 23. Descriptive statistics were performed to summarise the characteristics of the respondents and distribution of the variables, and correlation analysis was conducted to determine the strength of the relationship between independent and dependent variables. ANOVA (Analysis of Variance) was also employed to test whether there is actually a difference

between the four universities in terms of performance management practices. The effects of PAS, TAD, RCS, and EPE on SOG were calculated using multiple regression analysis. The regression coefficients and p-values were used to test the hypotheses at 5% level of significance.

Table 1: Reliability Statistics

Variable	Cronbach's Alpha	No. of Items
Performance Appraisal Systems (PAS)	0.742	5
Training and Development (TAD)	0.813	5
Reward and Compensation Systems (RCS)	0.701	5
Employee Participation and Engagement (EPE)	0.826	5
Sustainable Organizational Growth (SOG)	0.854	5

The reliability test in Table 1 shows a Cronbach's Alpha value above the minimum acceptable threshold of 0.70 (Nunnally & Bernstein, 1994). This implies that the instrument used to measure the variables performance appraisal, training and development, reward systems, employee participation, and sustainable organisational growth is internally consistent and dependable. In other words, the responses from the public sector employees are reliable, and the scale can be trusted to measure the constructs without significant measurement errors. The Regression model was specified as:

SOG = f (PAS, TAD, RCS, EPE)
equation (1)

SOG = a₀+a₁PAS+a₂TAD+ a₃RCS + a₄EPE+E
equation (2)

Where:

a₀ = Intercept

a₁-a₄ = Coefficients of the independent variables

SOG = Sustainable organisational growth measured through five items via organisational adaptability, consistency in growth, alignment of employee contributions with strategic goals, and the link between performance management and long-term sustainability.

PAS = Performance appraisal systems measured through five items that addressed the fairness,

objectivity, and the usefulness of performance evaluations in enhancing productivity and career growth.

TAD = Training and development assessed with five items that examine the availability, relevance, and effectiveness of training programs and opportunities for continuous learning within the organisation/institution.

RCS = Reward and compensation systems assessed by the adequacy, fairness, and motivational rewards.
The effect of both financial and non-financial rewards.

EPE = Employee participation and engagement measured with five items designed to capture employees' involvement in decision-making, teamwork, commitment, and sense of belonging in the organisation.

E = Error term

Results and Discussion

Of the 428 questionnaires that were distributed to the four tertiary institutions, only 400 were retrieved. Hence, the results were based on the responses of 400 well-filled questionnaires.

Table 2: Demographic Characteristics of Respondents

Category	Level	Count (n)	%
University (site)	Delta State University, Abraka (DELSU)	253	63.3%
	University of Delta, Agbor (UNIDEL)	64	16.0%
	Dennis Osadebay University, Asaba (DOU)	50	12.5%
	Delta State University of Science & Tech, Ozoro (DSUST)	33	8.3%
Gender	Male	220	55.0%
	Female	180	45.0%
Age group	< 30 years	80	20.0%
	30 – 39 years	140	35.0%

	40 – 49 years	110	27.5%
	≥ 50 years	70	17.5%
Cadre	Academic staff	240	60.0%
	Non-academic staff	160	40.0%
Highest qualification	BSc / HND (or equivalent)	160	40.0%
	MSc / MEd (or equivalent)	160	40.0%
	PhD	60	15.0%
	Others (NCE, Professional Certs)	20	5.0%
Years of service	< 5 years	90	22.5%
	5 – 10 years	120	30.0%
	11 – 15 years	80	20.0%
	16 – 20 years	50	12.5%
	> 20 years	60	15.0%
Job grade/level	Junior (entry/GL1–6 or equivalent)	100	25.0%
	Middle (GL7–12 or equivalent)	180	45.0%
	Senior (GL13+ / senior academic ranks)	120	30.0%
Marital status	Single	120	30.0%
	Married	250	62.5%
	Divorced / Widowed / Other	30	7.5%

Source: Researcher's Field Survey, 2025.

In Table 1, the gender composition of the respondents indicates that out of the total 400 participants, 240 (60%) were male, while 160 (40%) were female. This distribution suggests a male-dominated workforce in the selected universities, which is consistent with the general staffing pattern in many Nigerian tertiary institutions where male employees often occupy a larger share of both academic and administrative positions. The 60:40 ratio, however, still ensures that female perspectives are adequately captured in the study, allowing for a balanced interpretation of performance management practices across genders.

The age profile shows that 80 respondents (20%) were between 20 and 30 years, 120 respondents (30%) were aged 31 and 40 years, 140 respondents (35%) were between 41 and 50 years, while 60 respondents (15%) were aged 51 years and above. The dominance of the 41–50 age bracket indicates that the sample consists mainly of middle-aged employees who are likely to have considerable work experience and exposure to performance management practices. The presence of younger staff (20–30 years) and older staff (51 years and above) also ensures a balanced perspective across career stages.

The distribution of educational qualifications reveals that 60 respondents (15%) possessed OND/NCE, 100 respondents (25%) held a Bachelor's degree, 160 respondents (40%) had Master's degrees, while 80

respondents (20%) possessed a PhD. This demonstrates that the workforce is highly educated, with 60% of respondents (Master's and PhD holders) having attained postgraduate qualifications. Such a profile reflects the academic nature of university institutions and provides assurance that the respondents are knowledgeable enough to provide credible insights on performance management and organisational growth.

The data on work experience indicates that 90 respondents (22.5%) had 1–5 years of work experience, 110 respondents (27.5%) had 6–10 years, 120 respondents (30%) had 11–15 years, while 80 respondents (20%) had 16 years and above. The distribution reflects a relatively even spread across career stages, though the majority fall within the 6–15 years bracket (57.5%). This suggests that most of the respondents have been in the system long enough to understand organisational dynamics and assess the impact of performance management practices on sustainable growth.

The employment status distribution shows that 250 respondents (62.5%) were academic staff, while 150 respondents (37.5%) were non-academic staff. This balance indicates that the study captured views from both teaching and administrative arms of the universities. However, the higher proportion of academic staff reflects the core mission of universities as knowledge-production institutions.

Table 3: Descriptive Statistics

Variable	N	Minimum	Maximum	Mean	Std. Deviation (SD)
PAS	400	1.00	5.00	3.12	0.871
TAD	400	1.00	5.00	4.01	0.724
RCS	400	1.00	5.00	2.89	0.955
EPE	400	1.00	5.00	3.95	0.762
SOG	400	1.00	5.00	3.75	0.812

Source: Source: SPSS Output, 23.0

Table 3 shows the characteristics of the variables. Respondents to the first variable PAS were pretty neutral about the effectiveness of appraisal systems, reflected by a mean of 3.12 and a SD of 0.87. This suggests that appraisal practices in Nigeria's public sector are not strongly contributing to organisational growth, likely because many appraisal processes are bureaucratic, outdated, and fail to motivate employees. Also, Training and Development (TAD) received the highest score (4.01), showing that employees strongly agree it enhances organisational growth. This implies that when staff are trained, productivity and service delivery improve, which strengthens sustainability. Reward and Compensation Systems (RCS) display a low mean of 2.89, SD of 0.95

The low mean shows dissatisfaction. This reflects the Nigerian reality where reward and compensation systems are often inadequate, delayed, or inconsistent with performance outcomes. Poor compensation reduces motivation and commitment.

Employee Participation and Engagement (EPE) scored highly with a mean of 3.95, SD = 0.76. This is an indication that employees feel valued when they are involved in decision-making. In Nigeria's public sector, where hierarchy is rigid, creating room for staff participation enhances morale and long-term organisational growth.

Sustainable Organisational Growth (SOG) shows a mean of 3.75, SD of 0.81. This is sufficient that, Respondents generally agree that sustainable growth is achievable when effective HR practices are in place.

Table 4: Correlation Analysis

Variables	SOG	PAS	TAD	RCS	EPE
SOG	1	.298	.524	.102	.467
PAS	.298	1	.354	.211	.289
TAD	.524	.354	1	.187	.398
RCS	.102	.211	.187	1	.115
EPE	.467	.289	.398	.115	1

Source: SPSS Output, 23.0

The correlation analysis in Table 4 shows the extent to which PAS, TAD, RCS and EPE relate to sustainable growth in the study. From the coefficients, the performance and appraisal system has a moderate relationship, as well as the reward and compensation

systems. Both Training and development with employee participation and engagement possess a moderately strong relationship with sustainable growth. It is obvious that there are no negative trends among the variables and no perfect relationship, hence we proceeded to the regression.

Table 5: Anova

Model	Sum of Squares	Df	Mean Square	F	Sig.
Regression	96.842	4	24.210	49.510	.000b**
Residual	143.278	395	0.363		
Total	240.120	399			

Source: SPSS Output, 23.0.

The ANOVA result in Table 5 shows that the overall regression model is statistically significant ($p < 0.05$). This means that the independent variables altogether

have a significant effect on sustainable organisational growth in Nigeria's public sector.

Table 6: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.590 ^a	0.776	0.768	0.095

a. Dependent Variable: SOG

b. Predictors: (Constant), PAS, TAD, RCS, EPE

Source: SPSS Output, 23.0

The R value of 0.590 suggests a strong positive correlation between the predictors and sustainable growth. The R² value of 0.776 indicates that 77.6% of the variation in sustainable organisational growth can

be explained by the four independent variables. The remaining 22.4% is due to other factors such as leadership quality, political interference, funding, and policy stability.

Table 7: Coefficients

Model	Unstandardised B	Std. Error	Standardised Beta	T	Sig.
(Constant)	1.122	0.198	-	5.662	.033
PAS	0.089	0.048	.092	1.854	.065
TAD	0.442	0.056	.398	7.893	.010**
RCS	0.052	0.044	.058	1.182	.238
EPE	0.321	0.051	.317	6.294	.020**

a. Dependent Variable: SOG

Source: SPSS Output, 23.0

The coefficient values in Table 7 show that performance appraisal systems with ($\beta = 0.089$, $p = 0.065$) are not significant. This affirms that appraisals do not strongly predict organisational growth. This result concurs with the hypothesis raised in the study. This suggests that the current appraisal methods are more of a routine exercise than a developmental tool.

Also, Training and Development with ($\beta = 0.442$, $p = 0.010$) connotes high significance. This means that training directly boosts sustainable growth. This outcome differs from the earlier hypothesis, which suggested that well-trained employees are more skilled, innovative, and adaptable to organisational changes, making training a vital policy priority.

Similarly, reward and compensation systems have ($\beta = 0.052$, $p = 0.238$), which indicates non-significance, confirming the null hypothesis. This shows that compensation does not strongly influence growth, likely because in Nigeria's public sector, pay is standardised and not directly tied to performance. Hence, financial rewards alone are insufficient to drive growth.

Likewise, Employee Participation and Engagement has ($\beta = 0.321$, $p = 0.020$), which was highly significant. This outcome deviates from the hypothesis earlier stated; meaning employee participation and engagement are the strongest predictors. Implying that when employees are involved in decision-making and policy execution, they feel valued and work towards organisational goals, which fosters sustainable growth.

Conclusion/Recommendation

The study reveals that sustainable growth in Nigeria's public sector is strongly influenced by training/development and employee engagement, while appraisal systems and reward structures are weak contributors. The study recommends that for effective public sector reform, management should redesign appraisal systems to be developmental, refit compensation to reward merit, and place strong emphasis on capacity building and participatory management.

Publication Date: 2025/11/28

Abstract

Despite the growing awareness of the critical role that process improvement plays in organizational success, many manufacturing firms in developing economies, including Nigeria, struggle to effectively implement these strategies. The broad objective of this paper is to ascertain the relationship between process improvement and performance of manufacturing firms in Kaduna State, Nigeria. Specifically, the study seeks to examine the relationship between kaizen methodology and performance of the studied firms. The study was grounded on Complex Adaptive Systems (CAS) Theory, postulated by Holland (1995). Correlational research design was employed, a sample size of four-hundred (400) was obtained using Taro Yamane formula. The data collection instrument employed was the questionnaire while Pearson Product Moment Correlation was used to ascertain the relationship between the studied variables. Results obtained from a test of the hypothesis reveals a Pearson R coefficient of 0.762, indicating a strong positive relationship between kaizen methodology and performance of the studied firms. The P-value of 0.000 reveals that the result was statistically significant. Based on the findings, the researcher concluded that the relationship between process improvement and performance of the studied manufacturing firms is significant and positive. As a follow up to the conclusion of the study, the researcher recommended that the studied firms should strive towards continuous improvement of their manufacturing processes as it could directly impact performance level.

Key Words: Process improvement, Kaizen methodology, performance, waste reduction

Introduction

On a chronological basis, the rise of process improvement as a strategic direction in organization development has its origins in the post industrial times where efficiency and productivity became focal areas of business operations. Process improvement is a disciplined approach to making work processes more effective through the elimination of waste, action or inaction that appears to add no value to some process participants. In the early days, the idea got a lot of attention in the Western economies that happened in the automotive manufacturing industry when Toyota introduced lean production techniques. Adoption of the process improvement strategies over time has spread across the world that affects a broad spectrum of sectors (Brown & Mason, 2022). Process improvement has become a critical factor in the face of the ever-

challenging dynamic global economy. The world is being industrialized and diverse economies are continuously diversifying their economy and in doing so, companies must insist on continuous improvement strategies in order to deliver efficient operations, minimize wastes and maintain a competitive edge.

The need to adapt to the highly competitive global economy through operational excellence in their business operations has become a dire necessity in recent years among businesses in Nigeria. Process improvement strategies are slowly taking root in the Nigerian firms especially in the manufacturing industry with the aim of improving productivity, sustaining quality of the product, and cutting down costs. The manufacturing industry, which has been a major contributor to the gross domestic product (GDP) of the country, has its own challenges including poor

infrastructure, waste of materials involved, lack of uninterrupted power and excessive cost of production (Adetunji & Adewale, 2021). To conquer these obstacles Nigerian businesses are increasingly incorporating process improvement processes, such as process mapping, root cause and kaizen processes. Such tactics would enable companies to utilize the limited resources in the best ways possible and still stay competitive in local and international markets. Process improvement is of key consideration in the modern day business environment where organizations have to maintain or improve their performance and cut down wastage, stay competitive and dynamic. The rise of continuous demands of efficiency in operations has been aggravated by the trend in technological development with industries being revolutionized by these advancements. Such transformations have led to a paradigm shift on the way companies need to tackle both their internal processes and the manner they position themselves in the market. Businesses now have to constantly review and improve in their processes so that they can be competitive (Nwokolo, 2021).

Innovation and process improvement is not something optional to business, but a much needed innovative process in the manufacturing business that is very competitive in the global market. Technological changes are vulnerable in the facilitation of the process improvement. Implementation of automation technologies, as an example, enables organizations to limit the reliance on human effort, thus human error exploit, reduce wastage and increase production speeds. Automation increases the product quality and efficiency of operations, which play a critical role in firms that desire to satisfy the needs of the customers and remain ahead of their competitors. In the contemporary competitive international marketplace, companies that do not embrace effective process improvement practices run the risk of being displaced by the competitors. Firms which aim at ensuring that its manufacturing processes improve by the use of various technological advancements are better positioned to ensure that they achieve excellence as well as ensuring that there is a competitive advantage (Nguyen & Kim, 2023).

Although there has been increased awareness on how important process improvement is to the success of organizations, many firms in the developing economies, such as Nigeria, find it difficult to implement such a process successfully. Though the processes of the advanced economies have been highly optimized with the use of process improvement strategies to improve the efficiency of businesses, the target manufacturing firms are experiencing numerous processes that prevent them from utilizing the benefits of the deliberate application of process improvement strategies (Amadi

& Uche, 2023). Though scholars like Ogunleye (2020), Nwokolo (2021) and Adedeji and Olubunmi (2019) who carried out related studies in the Nigerian environment have recommended a full implementation of process improvement methodologies by manufacturing firms, most Nigerian manufacturing firms have not fully embraced this idea. This gives credence to carrying out a study of this nature in selected manufacturing firms in Kaduna State, Nigeria. The broad objective of this study is to ascertain the relationship between process improvement and performance of manufacturing firms in Kaduna State, Nigeria. Specifically, this study seeks to determine the relationship between kaizen methodology and organizational performance.

Review of Related Literature

Conceptual Review

Process Improvement

Process improvement is a set of methods systematically aimed at enhancing and streamlining organization processes in a bid to deliver improved performance results. It revolves around pinpointing the existing areas of inefficiencies, optimising work processes, and initiating strategic moves to enhance productivity, lessen the costs involved, and enhance the product or service quality on offer. By extension, the thing that process improvements fundamentally do is that they help create value by eliminating waste, reducing redundancies, and fostering the optimal use of resources (Alves, 2023). Process improvement also relies on one of the basic functions of process improvement, which is process mapping where the current work flow is documented to provide a good understanding of the organisation processes. The technique helps in isolating the areas of bottlenecks, duplication and waste in the system. According to visualizing the process, decision-makers operate to identify inefficiencies better and find optimization areas. This is the knowledge that can form the basis of making any changes that would result in more efficient and streamlined operations (Singh & Sharma, 2022).

Root cause analysis is another methodology of process improvement. This method aims at finding the root cause of a process inefficiency or flaws instead of curbing the symptoms. Root cause analysis entails the use of several tools (including 5 Whys and Fishbone Diagrams), which assist companies in researching the underlying causes of process complications and taking long-term corrective actions (Lee, 2022). Improvements in efficiency and quality can become more permanent by dealing with the root causes. A common approach to continuous improvement that has gained a lot of popularity is Kaizen in which one focuses on small changes to achieve great improvements as time goes by. Kaizen also creates an

atmosphere in an organization where employees at every echelon take the initiative to find and address issues. According to this methodology, the key thought is that gradual yet coherent alterations bring significant improvements in productivity and quality in the long run (Jang & Lee, 2023). Kaizen is in line with lean concepts that deal with minimizing wastage and maximizing value addition in an organization.

Performance metrics are also important to performance improvement to track progress, and gauge success. Such measures may incorporate the important performance measures (KPIs) including cycle time, error rates, and resource use. Monitoring such measures, an organization can gauge how successful improvements are and make evidence-based decisions to improve processes further. Significant monitoring keeps the spirit of constant change, and it keeps the organization flexible to render services in the changing market conditions (Odeyemi & Adebayo, 2021). The crux of this study is the kaizen methodology of process improvement..

Kaizen Methodology

Kaizen methodology focuses on change that aims at the continuous and gradual betterment. Kaizen refers to a philosophy that involves any betterment or rectification that leads to an improvement in productivity of an organization (Fariba & Ziba, 2013). Kaizen is a very strong concept forming most of the Japanese management styles (JMS) that have successfully transformed the Japanese industry of manufacturing and business organizations in Europe and America (Zailani, Shaharudin, & Saw, 2015). Kaizen focuses on the detection and eradication of losses that take place within the production process within an organization (Alves, 2014). Kaizen manufacturing refers to the simple and ordinary improvements and refinements that should be made on key end to end organisational transformation processes so as to serve and promote the entire continuous improvement strategy of an organisation. Demis, Teklegeorgis and Jemila (2020) also provided a few fundamental content of kaizen management practices that include; Total Quality Management (TQM), Total Productive Maintenance (TPM), Value Stream Mapping (VSM), Kanban, five S, kaizen event, suggestion system, five whys, error proofing and Toyota production system.

Performance

Performance in an organizational setting is the realization of the goals and objectives that have been set and are usually estimated using several key performance indicators (KPIs). It includes extremely many aspects that may comprise productivity, profitability, market share, level of customer satisfaction, and employee engagement. A sound

performance level is a sign that the organization makes effective use of resources available to deliver the desired results and address situations within and outside the organization (Kaplan & Norton, 2023). Organizational performance is multi-dimensional that is determined by many important factors. Internal procedures are also a major factor because efficiency and effectiveness are reinforced by streamlined and stream-lined workflows. As an example, companies using the process improvement methods can experience significant changes in their operational productivity because of the elimination of wastes and increased productivity (Womack & Jones, 2024). The latter can be done by prioritizing the optimization of the processes so that the firms could eliminate inefficiencies that undermine performance thus promoting the maximization of output and overall effectiveness. Another factor which is decisive in determining performance is the quality of goods or services. Organisations that focus on quality management are in a better position to address the expectations of the customer and increase satisfaction. This, in its turn, may result in higher customer loyalty and repeat business, without which no long-term success is possible (Deming, 2023). The component of material wastes reduction was the performance measurements used in this study.

Waste Reduction

The concept of material waste reduction relates to key economic activities involved in modern manufacturing industry as a way of reducing waste produced in the manufacturing procedures. The importance of waste minimization has become increasingly evident in more recent years, especially in the context of lean manufacturing that draws its focus to removing waste of any kind, be it overproduction, waiting, excess inventory, and/or defective products (Womack & Jones, 2024). Minimizing materials wastage does not only lead to environmental sustainability, but also efficiency and profitability of the firms. Adoption of the majority of techniques is also critical to effective reduction of material wastes. One of the best known approaches includes the just-in-time (JIT) production. This strategy shores that materials and components will be created or provided on demands only hence cutting down unnecessary inventory that can be stored and avoid costs (Ohno, 2023). Also to be used is the concept of recycling which is reprocessing resource material that would have been considered as waste material. By establishing recycling programs, organizations will have an opportunity not only to decrease the amount of waste needing to be placed in landfills but also to recover valuable materials, which can be used in the production process once again (Smith, 2023). The next innovative solution to waste reduction is the usage of alternative materials. Deciding to utilize more

environmentally-friendly or easily recycled material is also a method of cutting down on the waste created by companies, in addition to advancing their sustainability reputation (Johnson & Roberts, 2024). Companies that specialize in the reduction of material waste also have an increase of resource efficiency. Through material optimization, organizations are in a position to reduce the cost of production and become more productive. Investigations show that manufacturers who have been dealing with waste reducing strategies have reported high saving costs that have seen them become very competitive in the market (Taylor, 2023).

Theoretical Framework

The present study was based on a theory known as Complex Adaptive Systems (CAS) Theory by Holland, 1995. The theory provided that organizations have interrelated parts whose interactions were complex and dynamic and which were responsive to changes in the environment. This theory is especially needed to comprehend operations of organizations in non-linear and unpredictable environments where they can be affected by other factors like, technology, market trends, and consumer habits. In a business perspective, CAS Theory indicates that an organization operates as a dynamic entity, considering that an organization has to respond to external changes, as well as to the internal challenges. Compared with more traditional models, the CAS Theory does not prioritize the assessment of organizations as arrays of processes and linear systems. The fact that there is some interconnectedness means that there is a possibility that when one area gets improved upon there can be a series of knock on effects throughout the organization (Gharajedaghi, 2011). As an example, a technological innovation in manufacturing can not only increase efficiency in the production process but can also affect the distribution logistical process, labour and relationships to the customers. The Complex Adaptive Systems Theory is an elaborate theory of comprehending the dynamic process of organizations. It focuses on the significance of adaptability, emergent behaviour and connectedness and provides a lot of useful information on how process improvement is able to transform the performance of organizations. In this way, by using this theoretical perspective we will focus this paper to examine the complexities relating to process improvement strategies and performance of the manufacturing firms that were studied.

Empirical Review

In a quantitative study by Ogunleye (2020), Process Improvement in the Manufacturing Industries in Lagos States, Nigeria, the researcher used structured questions and questionnaires that were administered to 150 manufacturing firms in Lagos State through stratified random sampling to guarantee sectorial diversity.

Analysis of data through descriptive statistics and regression analysis, that demonstrate that a significant increase in productivity and efficiency occurs due to improvement of the process, and firms implementing waste-reduction strategies and quality management systems report an 25-percent increase in output.

In another research work, Nwokolo (2021) examined the subject of Process improvement and Operational Performance in the context of manufacturing firms in Enugu State, in Nigeria. They used a mixed approach where they used a structured questionnaire in surveying 120 firms and complemented their results through interviews with key managers. The findings were indicative of the extent to which there was a relationship between process improvement and enhanced performance to the operations, especially in the areas of shortened lead times and waste.

Adedeji and Olubunmi (2019) examined Process Improvement and Organizational Performance and its application in case of Nigerian small and medium-sized enterprises (SMEs). They conducted a cross-sectional survey of 100 SMEs in Oyo State and applied quantitative and qualitative method in the process of data collection. Statistical analysis has pointed out that the companies that are using effective methods to minimize waste have recorded improved performance indicators, such as improved customer satisfaction and less cost operations.

Process Improvement in the Service Industry A Study of Its Adoption and Effectiveness is a study conceived by Hiarini and Vagnoni (2016) in Italy. The qualitative methodology was used with 20 service firms being interviewed and secondary data analyzed. The results obtained indicated that process improvement leads to great improvements in services providing by streamlining operations as well as enhancing customer satisfaction.

In the same manner, Womack and Jones (2017) examined The Lean Startup: How Today Entrepreneurs Use Continuous Process Improvement to Create Radically Successful Businesses. In this study, the longitudinal case study approach was used on a number of startups in the United States. The conclusion was that startups that employ process improvement have a shortened product-market fit cycle and that it increases customer feedback loops, making business performance better.

Gap in Knowledge

A review of extant literature shows that none of the empirically reviewed examined process improvement as it relates to performance of manufacturing firms in Kaduna State, Nigeria.

Methodology

The study took correlational research approach because it aims at determining the relationship between the variables under study. Employees of four manufacturing companies in Kaduna State were utilized (Northern Noodles Ltd (275), Olam Poultry and Animal Feed (243), Sunglass Ltd (354), and Nigerian Breweries Malting Plant (372)) resulting in the demanded total of 1,244 employees. With a margin of error of 5%, sample size of 400 was arrived at using Taro Yamane formula, and Bowley (1926) formula was used to proportionately allocate questionnaires among firms Northern Noodles Ltd (88), Olam Poultry and Animal Feed (78), Sunglass Ltd (114), and Nigerian Breweries Malting Plant (120). A formulated

questionnaire employed was fulfilled through a structured questionnaire using a five point likert scale (SA-5, A-4, UD-3, D-2, SD-1). Face and content aspects of validity were checked and Cronbach alpha reliability test produced results of 0.741 which is higher than the set criterion of 0.70, thus internal consistency was established. The reliability result was indicated in Table 1 where that is, Cronbach Alpha= 0.741, number of items= 10, computed using SPSS version 22. Lastly, the correlation between the variables that this study tries to establish was analyzed using Pearson Product Moment Correlation Coefficient.

Data Presentation and Analysis

Data Presentation

Table 1: Returned and Unreturned Questionnaire

Analysis of Returned and Unreturned Questionnaire

Returned (Valid)	378	94.5%
Unreturned	22	05.5%
Total questionnaire administered	400	100%

Source: Field Survey, 2025

The above table indicates that three hundred and seventy-eight (378) copies of the questionnaire, signifying 94.5 percent of the four hundred (400) copies of the questionnaire were returned validly, and

22 signifying 5.5 percent were not returned. Based on that, a sample size of three hundred and seventy eight (378) copies of the questionnaire was used in the analysis.

Table 2: Descriptive Statistics for Kaizen Methodology

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Q1	378	1.00	5.00	3.1000	1.32637
Q2	378	1.00	5.00	3.2000	1.41152
Q3	378	1.00	5.00	3.2000	1.26231
Q4	378	2.00	5.00	3.3000	.96244
Q5	378	1.00	5.00	3.4000	1.21223
Valid N (listwise)	378				

Source: Field Survey, 2025

The analysis above reveals that mean scores for questions bothering on kaizen methodology are >2.5. This makes the responses adequate for the study.

Table 3: Descriptive Statistics for Organizational Performance (Waste Reduction)

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Q1	378	1.00	5.00	2.6521	1.21627
Q2	378	1.00	5.00	3.4222	1.41353
Q3	378	1.00	5.00	3.5027	1.27621
Q4	378	1.00	5.00	3.5213	.95254
Q5	378	1.00	5.00	3.3146	1.07244
Valid N (listwise)	378				

Source: Field Survey, 2025

The analysis above reveals that mean scores for questions bothering on organizational performance (waste reduction) are >2.5. This makes the responses adequate for the study.

Table 4: Correlations

		Kaizen Methodology	Org. Performance
Kaizen Methodology	Pearson Correlation	1	762**
	Sig. (2-tailed)		.000
	N	378	378
Org. Performance	Pearson Correlation	762**	1
	Sig. (2-tailed)	.000	
	N	378	378

****.** Correlation is significant at the 0.05 level (2-tailed).

Source: Field Survey 2025

The result shown in the table 4 above demonstrated that the Pearson R coefficient is 0.762, which denotes strong positive correlation between the kaizen methodology and firm performance of the companies investigated. The P-value of 0.000 indicates that the difference is significant with the P- value of less than 0.05 being an indication of a very low probability that the difference is favourable.

Discussion of Findings

The results of a test of the hypothesis indicated that there is a significant and strong positive relationship between kaizen methodology and performance of the manufacturing firms under consideration. This is in line with the study by Ogunleye (2020) who carried out a quantitative research entitled Process Improvement in Nigerian Manufacturing Industries in Lagos State, Nigeria. The results of the study reveal that process improvement aided by an application of kaizen approach has been found to contribute immensely to productivity and efficiency. The study Nwokolo (2021) arguing that Process Improvement and Operational Performance in Nigeria could not be left out in view of the findings in a test of the hypothesis. The findings were that an effective process improvement led to better operational performance, especially in realisation of shorter lead times and elimination of waste. The fact that there is a correlation between Process Improvement and Organizational Performance, as studied by Adedeji and Olubunmi (2019) in context of the Nigerian small and medium-sized enterprises (SMEs) also complies with the results of the hypothesis test. The research results found that companies with sound and effective waste reduction methods recorded better business performance indicators, such as

Test of Hypothesis

H₀ The relationship between kaizen methodology and performance of manufacturing firms in Kaduna State, Nigeria is not significant and positive.

customer satisfaction and less cost of operation. The study of Chiarini and Vagnoni (2016) conducted in Italy is also consistent with the conclusion made based on a test of the hypothesis. The study results indicated that the process improvement process using an approach that adopts the kaizen methodology is the method of significantly improving delivery of services due to process streamlining and increased levels of customer satisfaction.

Summary, Conclusion and Recommendation

Summary

The results taken in a test of the hypothesis show a strong positive relationship between the kaizen methodology and performance of the studied firms with a Pearson R coefficient of 0.762. The P-value holds a value of 0.000 thus indicating that the result is statistically significant.

Conclusion

Based on the above, the study holds that the connection between process improvement and performance of the manufacturing firms under examinations to be significant and positive. That is, material waste of the reviewed firms is likely to be reduced by adoption of a continuous improvement technique such as the kaizen methodology. This in turn has the potential to affect positively the general level of performance in these firms.

Recommendation

Following the conclusion of the study, the researcher will recommend that the firms which were studied should seek improvement in their manufacturing activities continuously because it may directly influence the level of performance.

Promoting Employee Retention through Career Progression in the Banking Industry in the Niger Delta

MORKA, Ogor Tessy¹; EJAKPOFON, Teagar Martha²

University of Delta Agbor

Delta State Nigeria

morka.tessy@unidel.edu.ng

martha.teagar@unidel.edu.ng

Publication Date: 2025/11/28

Abstract

This study analysed career progression and employee retention in the banking industry in the Niger Delta. Employee retention is challenging issue in organizations and especially when it comes to employees with expertise skills, experience and knowledge, who are attractive to employers in the similar industries. The banking industry loose its expert staffs due to several reasons like poor working conditions, high demands on the work tasks and too much work pressures. Yet, employees are integral to the functioning of organizations but they are undervalued, unappreciated and underpaid. From a population of 2341, the sample 341 respondents was chosen for the study. The simple percentage, mean & standard deviation as well as Pearson Product Moment Correlation analytic methods were used to analyse the data generated from field work. It was discovered that there is a significant relationship between career intervention and employee retention, there is a significant relationship between career guidance & counselling and employee retention, there is a significant relationship between career growth and employee retention, there is a significant relationship between soft skills and employee retention as well as there is a significant relationship between career mentoring and employee retention. From the findings generated for this study, banks should establish career intervention programs to identify employees' strengths, weaknesses, and career aspirations, regular career guidance and counselling sessions should be offered to help employees make informed decisions about their career progression, banks should create opportunities for career advancement, such as training, mentorship, and promotions. This will motivate employees to stay and grow within the organization among others.

Keywords: Career progression, employee retention, Banking industry, career intervention, career guidance and counselling, career growth, career mentoring

Introduction

The global business environment faces major challenges, one of which is retaining skilled and experienced employees who are essential for organizational success and sustainability (Kundu & Lata, 2021). Due to globalization, intense competition, and informed consumers, the demand for talented, knowledgeable, and motivated workers has greatly increased. Organizations worldwide now prioritize strategies such as training, competitive pay, conducive work environments, and career advancement opportunities to attract and retain top talent (Kurdi & Alshurideh, 2020; Krishna, Rao & Dana, 2021). In Nigeria, employee retention has become a major concern, especially in the banking sector, which experiences high turnover rates that disrupt service delivery, erode customer loyalty, and reduce profitability (Ezeuduji & Mbane, 2021). The link between career progression and retention in this sector is complex—while growth opportunities encourage

commitment, slow or blocked advancement can lead to frustration and employee exits. Performance management systems play a vital role, but their effectiveness varies across banks. Fair evaluations, regular reviews, and clear objectives enhance motivation and retention. Nigerian banks also use incentives such as salary packages, bonuses, insurance, and personal loans to retain staff (Chiekezie, Emejulu & Nwanneka, 2021). Additionally, initiatives like job promotion, enrichment, rotation, and training have proven effective in boosting employee satisfaction and long-term commitment (Shimels, 2021).

Problem statement

Employee retention is a challenging issue in organizations and especially when it comes to employees with expertise skills, experience and knowledge, who are attractive to employers in the similar industries. The banking industry loose its expert staffs due to several reasons like poor working

conditions, high demands on the work tasks and too much work pressures. Yet, employees are integral to the functioning of organizations but they are undervalued, unappreciated and underpaid. Employees are especially important in service-based organizations whose functioning largely relies on human touch. As such, effective career development practices adopted by organizations are likely to lead to improved performance and eventually employee retention. Challenges of career development in the Nigerian banking sector have led to early and mid-career employees to begin to consider resigning as there are no clear career paths for them. Oftentimes due to these challenges, qualified employees are not given opportunities for training and development due to organizational politics, nepotism, greed and discrimination on the grounds of gender or ethnicity. To this end, it has been observed that employees do not engage properly with their jobs. Furthermore, it has been observed that there is a low productivity in banks as a result of a lack of proper mentoring and self-development. Employees lack the necessary skills and knowledge to deliver quality services, improve performance and ensure that the organization maintains a competitive advantage over its rivals. The poor service delivery due to suboptimal employee performance has led to a decline in customers' satisfaction, employee quality of service delivery, employee punctuality and employee transparency. It is against this background that the study explores career progression and employee retention in the banking industry in the Niger Delta.

Objectives of the Study

- i. determine the relationship between career intervention and employee retention
- ii. ascertain the relationship between career guidance & counselling and employee retention
- iii. examine the relationship between career growth and employee retention
- iv. examine the relationship between career mentoring and employee retention

Research Questions

- i. To what extent does career intervention affect employee retention?
- ii. To what extent does career guidance & counselling affect employee retention?
- iii. To what extent does career growth affect employee retention?
- iv. To what extent does career mentoring affect employee retention?

Statement of Hypotheses

The following hypotheses were formulated to guide this study;

- H₀₁:** There is no significant relationship between career intervention and employee retention
- H₀₂:** There is no significant relationship between career guidance & counselling and employee retention
- H₀₃:** There is no significant relationship between career growth and employee retention
- H₀₄:** There is no significant relationship between career mentoring and employee retention

Literature Review and Theoretical Framework

This research's review of pertinent literature and discussion of the theoretical framework that underlies the study's topic will be the main points of this chapter. Following sub-themes will be covered in relation to it:

Literature Review

Concept of Employee Retention

Employee retention refers to an organization's ability to keep its employees over time through effective policies and practices that meet their needs and expectations (Ham, Lee, Shaw, & Hausknecht, 2022). It is vital for maintaining a stable, skilled workforce, reducing turnover costs, and ensuring long-term organizational success. High retention promotes productivity, continuity, and a strong organizational reputation, while high turnover disrupts performance and increases costs (Hausknecht, Rodda, & Howard, 2021). Key factors influencing retention include job satisfaction, organizational culture, career development, compensation, and work-life balance (Mitchell et al., 2023). Employees who feel satisfied, supported, and see opportunities for growth are more likely to remain. Competitive pay and benefits are important, but flexible work options and positive workplace culture often have greater long-term impact (Allen, Bryant, & Vardaman, 2020). Effective retention strategies focus on fostering engagement, recognition, and inclusion. Providing professional development, mentorship, and empowerment enhances loyalty (Saks, 2021). Leadership is also crucial—managers who communicate well, show empathy, and support employee growth strengthen retention (Kouzes & Posner, 2022). Finally, continuous evaluation of retention policies through feedback, exit interviews, and data-driven approaches helps organizations identify risks and refine strategies to retain valuable talent (Hausknecht & Trevor, 2021).

Concept of Career Progression

Career progression refers to the continuous advancement and growth of individuals in their professional journey, marked by skill acquisition,

increased responsibility, and movement to higher or more diverse roles (Greenhaus, Callanan, & Godshalk, 2020). It includes both vertical promotions and lateral moves that broaden experience and versatility. For employees, career progression provides direction, motivation, and job satisfaction by recognizing achievements and offering growth opportunities (Gutteridge, Leibowitz, & Shore, 1993). For organizations, it enhances talent retention, reduces turnover, and fosters a skilled, adaptable workforce that strengthens competitiveness (Baruch, 2019). Key factors influencing career progression include personal aspirations, organizational support, and external factors such as economic and technological changes (Arthur, Hall, & Lawrence, 1989). Employees who proactively seek growth, acquire new skills, and network effectively are more likely to progress (Eby, Butts, & Lockwood, 2020). Organizations can promote career progression through structured development programs, mentorship, transparent promotion systems, and a culture of continuous learning (London & Smither, 2023; Tharenou, 2023). Clear communication of advancement criteria and equal access to opportunities also ensure inclusivity and sustained motivation across the workforce.

Concept of Career Intervention

Career intervention refers to deliberate strategies and practices aimed at helping individuals make informed career decisions, overcome professional challenges, and achieve career goals. It forms a core part of career development and counseling, involving activities such as career counseling, mentoring, education, and skills training (Brown & Lent, 2022). These interventions guide individuals at different career stages—from schooling to retirement—by helping them understand their strengths, interests, and values, and by equipping them to navigate the dynamic labor market (Swanson & Fouad, 2020). Career counseling, one major form of intervention, offers personalized guidance through assessments and counseling sessions to align individuals' skills and interests with suitable career paths (Sampson et al., 2019). Educational and training programs, such as vocational courses and professional certifications, help individuals acquire relevant competencies and enhance employability (Niles & Harris-Bowlsbey, 2022). Mentoring, on the other hand, provides ongoing support from experienced professionals who offer insights, networking opportunities, and career advice (Kram, 2020). The benefits of career interventions extend beyond individuals to organizations and society. They promote job satisfaction, engagement, and retention, leading to higher productivity and reduced turnover (Hirschi, 2020). At a broader level, they foster a skilled, adaptable workforce, drive economic growth, and

enhance social equity by improving access to career development opportunities for all (Blustein, 2021).

Concept of Career Guidance and Counselling

Career guidance and counseling are essential processes that assist individuals in making well-informed educational and professional decisions by aligning their interests, abilities, and values with suitable career paths. While career guidance focuses on providing general information and advice about different career options, career counseling offers more personalized and in-depth support to help individuals address specific challenges such as indecision, dissatisfaction, or career transitions (Gibson & Mitchell, 2020). These services are crucial at all stages of life—helping students choose suitable educational paths and supporting adults in career changes, skill enhancement, and lifelong learning in an ever-evolving job market (Brown & Lent, 2022).

The key elements of career guidance and counseling include assessment, which uses tools to identify personal interests, skills, and traits; career exploration, which involves researching occupations and industries; decision-making support, which helps individuals evaluate options and build confidence during transitions; and career planning, which focuses on developing structured and adaptable strategies to achieve career goals (Niles & Harris-Bowlsbey, 2022; Savickas, 2022; Amundson, Borgen, & Erlebach, 2020; Zunker, 2020). Overall, these processes empower individuals to take charge of their career development, promoting satisfaction, personal growth, and adaptability in a dynamic world of work.

Concept of Career Growth

Career growth is a dynamic and ongoing process that encompasses the development and advancement of an individual's career over time. It involves acquiring new skills, gaining valuable experiences, and moving up the career ladder. This concept is essential for both personal satisfaction and professional success, as it reflects an individual's progress in their chosen field and their ability to achieve their career goals. Career growth is influenced by various factors, including individual aspirations, organizational support, and external conditions.

Career growth can be understood as the positive changes and advancements that occur in an individual's career journey. These changes may include promotions, increased responsibilities, salary increments, and the development of expertise in a particular area. Career growth is not solely about vertical advancement but also includes lateral moves that enhance an individual's skill set and broaden their experiences. This holistic view of career growth emphasizes the importance of

continuous learning and adaptability in achieving long-term career success (Hall, 2022).

Career growth plays a vital role in both individual and organizational success. For employees, it enhances job satisfaction, motivation, and engagement by providing a sense of purpose and opportunities for advancement and personal development (Greenhaus, Callanan, & Godshalk, 2020). For organizations, supporting career growth helps attract and retain talented workers, reduce turnover, and build a skilled, motivated, and high-performing workforce (Baruch, 2019).

Career growth is influenced by individual effort, organizational practices, and external conditions. Employees who actively pursue learning, seek feedback, and take on challenging roles are more likely to advance in their careers (De Vos, Dewettinck, & Buyens, 2020). Organizations also play a key role by offering training, mentorship, and fair promotion systems that encourage professional development and internal mobility (Jehanzeb & Bashir, 2022). Externally, factors such as economic trends, industry changes, and technological innovations can create new opportunities or barriers to career advancement (Fugate, Kinicki, & Ashforth, 2019).

Effective career growth strategies combine personal initiative with organizational support. Individuals should set clear goals, pursue skill development, and build professional networks to access new opportunities (Higgins & Kram, 2023). Meanwhile, organizations should foster a culture of continuous learning, provide development resources, and implement leadership and succession programs to prepare employees for future roles (Kirkland, 2021). Overall, career growth benefits both employees and employers by driving motivation, performance, and long-term success.

Concept of Career Mentoring

Career mentoring is a developmental partnership through which a more experienced or knowledgeable person (the mentor) provides guidance, support, and advice to a less experienced or knowledgeable person (the mentee). This relationship is designed to foster the mentee's personal and professional growth, enhance their career development, and assist them in achieving their career goals. The concept of career mentoring has gained significant attention in both academic literature and practical applications due to its profound impact on career advancement and organizational success.

Mentoring, as a concept, has deep historical roots, tracing back to Homer's 'The Odyssey,' where the character Mentor guides the young Telemachus. In modern contexts, career mentoring involves a more structured relationship that focuses on career development rather than the purely personal guidance seen in its historical counterpart (Kram, 2020). The

primary goal of career mentoring is to support the mentee's career progression by providing insights, feedback, and encouragement based on the mentor's own experiences and knowledge.

The importance of career mentoring is multifaceted. For the mentee, mentoring can lead to enhanced career satisfaction, increased self-confidence, and a clearer understanding of career paths and opportunities. Mentees often gain critical skills, such as decision-making, problem-solving, and strategic thinking, which are essential for career advancement. Moreover, having a mentor can significantly expand a mentee's professional network, providing access to opportunities that might otherwise be unavailable (Allen, Eby, Poteet, Lentz, & Lima, 2019).

For mentors, the relationship can also be highly rewarding. Mentors often experience a sense of personal satisfaction from contributing to the growth and development of another individual. They can also gain new perspectives and insights from their mentees, which can enhance their own professional development and effectiveness. Additionally, mentoring can strengthen leadership skills, as mentors practice coaching, communication, and interpersonal skills (Ragins & Kram, 2022).

From an organizational perspective, career mentoring is a strategic tool for talent development and retention. Organizations that implement effective mentoring programs often see higher levels of employee engagement, job satisfaction, and loyalty. Mentoring helps to transfer knowledge and skills from experienced employees to newer ones, thereby preserving organizational memory and fostering a culture of continuous learning. This can lead to improved performance, innovation, and a competitive edge in the marketplace (Chao, Walz, & Gardner, 1992).

The process of career mentoring typically involves several stages, including initiation, cultivation, separation, and redefinition. During the initiation stage, the mentor and mentee establish their relationship, set expectations, and identify initial goals. The cultivation stage is characterized by the development of a deep and trusting relationship, with frequent interactions and significant growth for the mentee. Separation occurs as the mentee gains more independence and confidence, requiring less guidance. Finally, the redefinition stage involves the evolution of the relationship into a more equal partnership or friendship (Kram, 2020).

Effective career mentoring requires certain qualities and skills from both the mentor and the mentee. Mentors should possess strong communication skills, a genuine interest in the mentee's development, and the ability to provide constructive feedback. They should also be willing to share their experiences and knowledge openly. Mentees, on the other hand, should

be proactive in seeking guidance, open to feedback, and committed to their own growth and development. The success of the mentoring relationship largely depends on mutual respect, trust, and a shared commitment to the mentee's career goals (Eby, Rhodes, & Allen, 2022).

Mentoring can take various forms, including formal and informal mentoring. Formal mentoring programs are typically organized by organizations and involve structured matching processes, training, and scheduled interactions. Informal mentoring relationships develop more naturally, often based on mutual interests and personal connections. Both forms of mentoring have their benefits, but formal programs can provide more consistent support and accountability (Ragins & Cotton, 2023).

Career Intervention and Employee Retention

Career intervention and employee retention are closely linked, both playing vital roles in organizational success and employee satisfaction. Career intervention refers to organizational initiatives—such as counseling, training, mentorship, and performance appraisals—designed to guide employees in their career development and skill acquisition. These initiatives help align employees' personal goals with organizational objectives, fostering engagement and loyalty that enhance retention. Career counseling helps employees identify strengths, set achievable goals, and plan their career paths, demonstrating organizational commitment to employee growth (Gutteridge, Leibowitz, & Shore, 1993). Training and development programs build competencies, support continuous learning, and increase job satisfaction, motivating employees to remain with the organization (Noe, Clarke, & Klein, 2014). Mentorship provides guidance and connection, strengthening workplace relationships and belonging, which further boosts retention (Allen et al., 2019). Performance appraisals offer constructive feedback and recognition, reinforcing motivation and commitment (DeNisi & Murphy, 2022). Effective career interventions significantly reduce turnover by fulfilling employees' needs for growth, recognition, and advancement (Griffeth, Hom, & Gaertner, 2020). They also foster a positive organizational culture where continuous development and collaboration thrive, enhancing overall stability and morale (Jehanzeb & Bashir, 2022). Conversely, neglecting career interventions can lead to high turnover, loss of talent, and reduced productivity. Therefore, investing in structured career development initiatives is crucial for both employee satisfaction and long-term organizational sustainability (Mitchell et al., 2023).

Career Guidance & Counselling and Employee Retention

Career guidance and counselling are crucial tools for enhancing both individual career development and organizational success. These programs help employees identify their skills, interests, and values, enabling them to set realistic career goals and align their aspirations with organizational opportunities. This alignment fosters job satisfaction, motivation, and a stronger sense of belonging within the workplace (Brown & Lent, 2022).

Employee retention, a major challenge for organizations, can be significantly improved through effective career guidance and counselling. High turnover rates often result in financial losses and loss of institutional knowledge (Horn et al., 2022). By addressing employees' career concerns and providing developmental support, organizations can reduce dissatisfaction and strengthen commitment. Studies show that job satisfaction is a strong predictor of retention, and career counselling helps employees see how their roles support their long-term goals (Judge & Kammeyer-Mueller, 2020).

Furthermore, career counselling provides a platform for communication, allowing employees to voice challenges and receive guidance, which reinforces their emotional commitment to the organization (Meyer & Allen, 2021). It also supports workforce adaptability by developing employees' skills to meet changing business demands, thereby boosting confidence and reducing turnover.

Overall, organizations that prioritize career guidance and counselling foster a supportive, growth-oriented culture. This not only enhances engagement and morale but also strengthens loyalty, ultimately leading to higher retention and sustained organizational performance (Saks, 2021).

Career Growth and Employee Retention

Career growth and employee retention are closely linked elements that determine organizational stability and success. Employee retention reflects an organization's ability to maintain its workforce over time, while career growth involves the professional advancement opportunities available to employees. When organizations actively support career development, employees tend to be more engaged, loyal, and productive. Opportunities for advancement, training, and mentorship greatly influence employee satisfaction and retention. Employees who see clear career pathways are more motivated and less likely to leave, as growth prospects enhance their sense of purpose and commitment (Maslach, Schaufeli, & Leiter, 2023). Investment in development programs, such as training and skill-building, not only increases employee competence and confidence but also signals that the

organization values their progress (Cappelli, 2020). Mentorship programs further strengthen retention by connecting employees with experienced guides who provide support and direction, fostering belonging and loyalty (Allen et al., 2019). Similarly, promotion opportunities encourage employees to remain committed, as fair and transparent advancement systems reinforce motivation (Trevor, Gerhart, & Boudreau, 2023). Lateral career moves and job rotation also promote retention by keeping work engaging and preventing stagnation, while broadening employees' skills and understanding of the organization (Campion, Cheraskin, & Stevens, 2019). Finally, a supportive organizational culture that prioritizes career development cultivates affective commitment—employees' emotional attachment to their workplace—which significantly reduces turnover (Meyer & Allen, 2021). In summary, fostering career growth through training, mentorship, fair promotions, and an empowering culture not only enhances employee capability and satisfaction but also ensures long-term retention and organizational success.

Career Mentoring and Employee Retention

Career mentoring is a key strategy for enhancing employee development and improving retention within organizations. It involves pairing less experienced employees with seasoned mentors who provide guidance, support, and career advice. Through these relationships, employees gain skills, confidence, and

direction, which foster professional growth and strengthen organizational loyalty (Allen et al., 2019). Mentoring has been shown to significantly boost job satisfaction, engagement, and commitment. Mentored employees often feel more valued and supported, leading to higher retention rates (Ragins, Cotton, & Miller, 2020). The trust and connection developed through mentoring create a sense of belonging and community, which enhances workplace morale and reduces turnover intentions. Additionally, mentoring facilitates the transfer of organizational culture and knowledge. Mentors help mentees understand company values, norms, and expectations, aiding smoother integration and stronger alignment with organizational goals (Kram, 2020). This cultural socialization strengthens employees' identification with their workplace, making them more likely to remain long-term. Mentoring also plays a vital role in leadership development. By learning from experienced leaders, mentees acquire critical insights, competencies, and confidence to take on future leadership roles (Day & Allen, 2019). This investment in employee growth not only prepares organizations for succession but also signals commitment to employee advancement—further reinforcing loyalty and retention. In summary, career mentoring enhances both individual and organizational outcomes by promoting growth, engagement, and continuity. It cultivates skilled, motivated, and committed employees, thereby contributing to sustained organizational success.

Conceptual Framework

Fig. 1: Conceptual framework showing the interrelationship between career progression and employee retention

Theoretical Framework

Social Exchange Theory (SET), developed by Homans (1958) and Blau (2020), explains workplace

relationships as reciprocal exchanges where individuals seek to maximise benefits while minimising costs. In Nigerian banks, the theory is highly relevant given the sector's high employee turnover and need for sustained commitment. SET highlights **reciprocity**, where employees respond positively when organisations invest in their career development through training, mentorship, and clear advancement opportunities—leading to loyalty and reduced turnover (Okurame, 2020). It also underscores the role of perceived organisational support (POS), showing that employees are more likely to stay when they feel valued and supported through fair compensation and recognition (Eisenberger et al., 1986). Furthermore, trust and commitment form the foundation of enduring employer-employee relationships. Transparent and consistent career progression builds trust, encouraging long-term commitment (Blau, 2020; Coetzee & Stoltz, 2020). Finally, supervisory support and mentoring enhance the quality of exchange relationships, improving job satisfaction and retention (Scandura & Williams, 2019). Overall, SET provides a strong framework for understanding how mutual investment and support between Nigerian banks and their employees foster loyalty, satisfaction, and organisational stability.

Empirical Studies

Smith and Johnson (2018) conducted a study on the impact of career intervention programs on employee retention in a major bank in the United States. They found that employees who participated in structured career development programs were 25% more likely to stay with the company for at least three years compared to those who did not participate. The study highlighted the importance of continuous career support and personalized career paths in retaining talent.

A study conducted by Thiriku and Were (2021) in Kenya's banking sector revealed that career growth positively influence employee retention. The research demonstrated that employees are more likely to remain with an organization that provides clear and attainable promotion paths. Moreover, the study suggested that transparent promotion policies and practices enhance employees' perceptions of fairness and organizational justice, which are crucial for retention.

Empirical evidence suggests that the cultivation of soft skills contributes to higher levels of employee retention in the banking industry. For instance, a study by Zhang and Zhou (2018) found that employees who possess strong interpersonal skills and emotional intelligence are more likely to build rapport with clients and colleagues, fostering a positive work environment and reducing turnover rates. This relational aspect of soft skills enhances job satisfaction and loyalty among employees, as they feel valued and supported in their roles.

A study by Izlurrell, Scholarios, and Thompson (2022) examined the importance of soft skills in the banking industry and their impact on employee retention. The research, conducted in the UK banking sector, highlighted that employees who perceived their soft skills as adequately recognized and rewarded were more likely to remain with their employers. The study used a mixed-methods approach, combining surveys and interviews, to assess the relationship between soft skills and retention. The findings indicated that soft skills development leads to higher job satisfaction and stronger organizational commitment, both of which are critical factors in reducing turnover rates.

Methodology Research Design

The study used survey approach. A population is also known as a universe in research (Best & Khan, 2020). This study includes all bank employees in the Niger Delta. The population distribution came around 2341 across, First Bank, Guarantee Trust Bank, United Bank of Africa, Eco Bank, Zenith, Fidelity Bank. A sample size of 341 was achieved using Taro Yamani's formula. Open-ended and closed-ended questionnaires was used and distributed to the respondents along with structured interviews. The concept of validity is concerned with the extent to which your questionnaire measures what it purports to measure, and is often rephrased as "truthfulness," or "accuracy." The test-retest approach, which compares results from one time to results from another time using the same subject and research instrument, will be used to assess the reliability of the questionnaire. The dependability index of the instrument, which was calculated using Cronbach-Alpha, was 0.81.

Case Processing Summary

	Mean	Std. Deviation	N
Career intervention	3.2108	.40332	5
Career guidance & counselling	2.9565	.79304	5
Career growth	2.5687	.21876	5
Career mentoring	2.6795	.40079	5
Employee retention	3.3856		5

- a. Listwise deletion based on all variables in the procedure

Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.813	.813	30

- a. Listwise deletion based on all variables in the procedure

Method of Data Analysis

Based on the established research hypotheses and study objectives, the survey data will be examined. To understand and analyze the socio-demographic data, a simple frequency distribution and percentages

statistical technique will be employed. The study's hypotheses will be tested using the statistical method known as Pearson Product Moment Correlation (PPMC).

Analysis of Data

Section A: Demographic data of respondents

Table 4.1: Gender distribution of respondents

Gender	Frequency	Percentage (%)
Male	212	64.4
Female	117	35.6
Total	329	100

Source: Fieldwork, 2025

The above table distribution shows that 212(64.4%) of the total respondents are males, while 117(35.6%) of

the respondents are females. The males dominated the females.

Table 4.2: Age Distribution of Respondents

Age	Frequency	Percentage (%)
18-25yrs	81	24.6
26 above	246	74.8
Total	329	100

Source: Fieldwork, 2025

The distribution above shows the age distribution of respondents. It reveals that 81(24.6%) of the total

respondents are within the age bracket of 18-25yrs, while 246(74.8%) of the respondents are within the age bracket of 26 and above.

Table 4.3: Educational Qualification of Respondents

Educational Qualification	Frequency	Percentage (%)
B.Sc.	51	15.5
M.Sc.	136	41.3
Ph.D	142	43.7
Total	329	100

Source: Fieldwork, 2025

The distribution above shows that 142(43.7%) of the total respondents have attained Ph.D which constitute the highest of the respondents while 51(15.5%) of the respondents have attained B.Sc constitute the lowest.

Analysis of Research Questions

Research Question 1: To what extent does career intervention affect employee retention? Table

Analysis of Research Question 1

S/N	ITEMS	SA 4	A 3	SD 2	D 1	Total	Mean	Decision
1	I feel like I am a valued member of the team.	109 (436)	104 (312)	-	116 (116)	329 (864)	2.62	Accepted
2	I feel like my skills and knowledge are appreciated.	109 (436)	104 (312)	-	116 (116)	329 (864)	2.62	Accepted
3	I feel like my contributions are recognized and rewarded.	128 (512)	56 (168)	50 (100)	95 (95)	329 (778)	2.66	Accepted
4	I feel like I have a good work-life balance.	157 (628)	57 (114)	115 (230)	-	329 (972)	2.95	Accepted
5	I feel like my career goals are aligned with the company's goals.	221 (884)	-	-	108 (108)	329 (992)	3.01	Accepted
Grand Mean = 2.72								

Source: Field Survey Data, 2024

Table 4.4 showed that respondents accepted I feel like I am a valued member of the team with mean score of 2.62. respondents accepted I feel like my skills and knowledge are appreciated, I feel like my contributions are recognized and rewarded, I feel like I have a good work-life balance, I feel like my career goals are

aligned with the company's goals with mean scores of 2.62, 2.66, 2.95 & 3.01 respectively. Based on the grand mean of 2.72, it can be inferred therefore that career intervention affects employee retention.

Research Questions 2: To what extent does career guidance & counselling affect employee retention?

S/N	ITEMS	SA 4	A 3	SD 2	D 1	Total	Mean	Decision
1	The career guidance I received was tailored to my individual needs and interests	108 432	91 273	92 184	38 38	329 927	2.81	Accepted
2	The guidance counselor/ advisor provided valuable insights into various career paths	146 584	103 309	40 80	40 40	329 1013	3.10	Accepted
3	I feel more informed about the steps I need to take to achieve my career goals	131 524	141 423	57 114	-	329 1061	3.22	Accepted
4	The career guidance session helped me identify my strengths and areas for improvement	290 1160	-	39 78	-	329 1238	3.76	Accepted
5	I am satisfied with the level of support and guidance I received during this session	108 432	92 276	81 182	48 48	329 938	2.85	Accepted
Grand Mean = 3.15								

Source: Field Survey Data, 2025

Table 4.5 showed that respondents accepted that The career guidance I received was tailored to my individual needs and interests with mean score of 2.81. Respondents accepted The guidance counselor/advisor provided valuable insights into various career paths with a mean score of 3.10. Respondents accepted I feel more informed about the steps I need to take to achieve

my career goals with a mean score of 122. Respondents accepted The career guidance session helped me identify my strengths and areas for improvement as well as I am satisfied with the level of support and guidance I received during this session with mean scores of 3.76 and 2.85 respectively. Based on the grand mean of 3.14, it can be inferred therefore that

career guidance & counselling affects employee retention.

Research Questions 3: To what extent does career growth affect employee retention? Table 4.6: Analysis of Research Question 3

S/N	ITEMS	SA 4	A 3	SD 2	D 1	Total	Mean	Decision
1	There was a clear progression ladder in my work	101 404	123 369	45 90	-	329 863	2.62	Accepted
2	I needed to continuously elevate my educational level to grow in my career	224 896	-	105 210	-	329 1106	3.40	Accepted
3	I stayed in my career as a banker because I had no option of other careers			329 658	-	329 658	2	Rejected
4	The training and development opportunities offered by my organization have contributed to my career growth	131 524	81 243	90 180	27 27	329 974	3.00	Accepted
5	I am satisfied with the advancement opportunities available to me within my current organization	213 852	-	116 232	-	329 1084	3.30	Accepted
Grand Mean = 2.90								

Source: Field Survey Data, 2025

Table 4.6 showed that respondents accepted there was a clear progression ladder in my work, I needed to continuously elevate my educational level to grow in my career with mean scores 2.62 and 3.40 respectively. Respondents rejected I stayed in my career as a banker because I had no option of other careers with mean score 2. Respondents accepted the training and development opportunities offered by my organization

have contributed to my! Career growth as well as I am satisfied with the advancement opportunities available to me within my current organization with mean scores 3.00 and 3.30 respectively. Based on the grand mean of 2.90, it can be inferred therefore that career growth affects employee retention.

Research Questions 4: To what extent does soft skills affect employee retention?

Table 4.7: Analysis of Research Question 4

S/N	ITEMS	SA 4	A 3	SD 2	D 1	Total	Mean	Decision
1	I have improved my communication skills as a result of training or development programs	329 1316	-	-	-	329 1316	4	Accepted
2	The soft skills training I received has helped me work more effectively in teams	329 1316	-	-	-	329 1316	4	Accepted
3	I feel more confident my ability to adapt to new situations and challenges	329 1316	-	-	-	329 1316	4	Accepted
4	The training in interpersonal skills has enhanced my relationships with colleagues and clients	329 1316	-	329 1316	-	329 1316	4	Accepted
5	I believe that the soft skills I have developed are valuable for my professional success	329 1316	-	-	-	329 1316	4	Accepted
Grand Mean = 4.00								

Source: Field Survey Data, 2025

Table 4.7 showed that respondents accepted I have improved my communication skills as a result of training or development programs, The soft skills training I received has helped me work more effectively in teams, I feel more confident in my ability to adapt to new situations and challenges, The training in interpersonal skills has enhanced my relationships with colleagues and clients as well as I believe that the

soft skills I have developed are valuable for my professional success all scoring 4. Based on the grand mean of 4.00, it can be inferred therefore that soft skills affect employee retention.

Research Questions 5: To what extent does career mentoring affect employee retention? Table

4.8: Analysis of Research Question 5

S/N	ITEMS	SA 4	A 3	SD 2	D 1	Total	Mean	Decision
1	My mentor was important to my professional development	108 432	91 273	92 184	38 38	329 927	2.81	Accepted
2	My mentor kept in touch regarding my progress	146 584	103 309	40 80	40 40	329 1013	3.10	Accepted
3	I went through most of my career without a mentor	131 524	141 423	57 114	-	329 1061	3.22	Accepted
4	I feel that my mentor genuinely cares about my professional development and success	290 1160	-	39 78	-	329 1238	3.76	Accepted
5	I appreciate the constructive feedback and advice I receive from my mentor	108 432	92 276	81 182	48 48	329 938	2.85	Accepted
Grand Mean = 3.15								

Source: Field Survey Data, 2025

Table 4.8 showed that respondents accepted that My mentor was important to my professional development with mean score of 2.81. Respondents accepted My mentor kept in touch regarding my progress a mean score of 3.10. Respondents accepted I went through most of my career without a mentor with a mean score

of 3.22. Respondents accepted I feel that my mentor genuinely cares about my professional development and success as well as I appreciate the constructive feedback and advice I receive from my mentor with mean scores of 3.76 and 2.85 respectively. Based on the grand mean of 3.14, it can be inferred therefore that career mentoring affect employee retention.

Testing of Hypotheses

Hypothesis 1: There is no significant relationship between career intervention and employee retention

Table 4.9: Pearson (r) Analysis of career intervention and employee retention

		Career intervention	Employee retention
Career intervention	Pearson Correlation	1	.268*
	Sig. (2-tailed)		.133
	N	329	.133
Employee retention	Pearson Correlation	.268*	1
	Sig. (2-tailed)	.133	
	N	329	329

* Correlation is significant at the 0.05 level (2-tailed)

Table 4.9 shows a Pearson's r-value of 0.268 and a p-value of 0.133. Testing at an alpha level of 0.05, the p-value is greater than the alpha level, so, the null hypothesis which states that "There is no significant relationship between career intervention and employee

retention is rejected. Consequently, there is a significant relationship between career intervention and employee retention.

Hypothesis 2: There is no significant relationship between career guidance & counselling and employee retention

Table 4.10: Pearson (r) Analysis of career guidance & counselling and employee retention

		career guidance & counselling	Employee retention
Career guidance & counselling	Pearson Correlation	1	.266*
	Sig. (2-tailed)		.131
	N	329	329
Employee retention	Pearson Correlation	.266*	1
	Sig. (2-tailed)	.131	
	N	329	329

* Correlation is significant at the 0.05 level (2-tailed)

Table 4.10 shows a Pearson's r-value of 0.266 and a p-value of 0.131. Testing the hypothesis at an alpha level of 0.05, it is seen that the p-value is greater than the alpha level, so, the null hypothesis which states that "There is no significant relationship career guidance & counselling and employee retention" is rejected.

Consequently, there is a significant relationship between career guidance & counselling and employee retention.

Hypothesis 3: There is no significant relationship between career growth and employee retention

Table 4.11: Pearson (r) Analysis of career growth and employee retention

		Career growth	Employee retention
Career growth	Pearson Correlation	1	.316*
	Sig. (2-tailed)		.041
	N	329	329
Employee retention	Pearson Correlation	.316*	1
	Sig. (2-tailed)	.041	
	N	329	329

* Correlation is significant at the 0.05 level (2-tailed)

Table 4.11 shows a Pearson's r-value of 0.316 and a p-value of 0.041. Testing the hypothesis at an alpha level of 0.05, the p-value, which is 0.041 is less than the alpha level, so, the null hypothesis which states "there is no significant relationship between career growth

and employee retention" is rejected. The conclusion is that "there is significant relationship between career growth and employee retention".

Hypothesis 4: There is no significant relationship between career mentoring and employee retention

Table 4.13: Pearson (r) Analysis of career mentoring and employee retention

		Career mentoring	Employee retention
Career mentoring	Pearson Correlation	1	.265*
	Sig. (2-tailed)		.129
	N	329	329
Employee retention	Pearson Correlation	.265*	1
	Sig. (2-tailed)	.129	
	N	329	329

* Correlation is significant at the 0.05 level (2-tailed)

Table 4.13 shows a Pearson's r -value of 0.265 and a p -value of 0.129. Testing the hypothesis at an alpha level of 0.05, it is seen that the p -value is greater than the alpha level, so, the null hypothesis which states that "There is no significant relationship between career mentoring and employee retention" is rejected. Consequently, there is a significant relationship between career mentoring and employee retention.

Discussion of Findings

Career intervention and employee retention

The results in Table 4.9 showed a significant relationship between career intervention and employee retention ($r = 0.268$, $p < 0.05$). This finding is supported by several studies across countries and contexts. Smith and Johnson (2018) found that structured career development programs in U.S. banks increased employee retention by 25%, highlighting the value of continuous career support. Similarly, Kumar and Gupta (2019) discovered that mentorship programs in Indian banks improved job satisfaction and reduced turnover by 20%, emphasizing the role of guidance and support. Wang et al. (2020) revealed that training interventions in Chinese banks enhanced employee skills and reduced attrition by 30%. In Nigeria, Adeyemi and Ogunleye (2022) found that career workshops boosted job satisfaction and organizational commitment, improving retention. Jones and Brown (2021) also noted a 15% reduction in turnover intentions among European bank employees who received career counseling. Lopez et al. (2023) confirmed that Latin American banks with robust career development programs experienced lower turnover, while Cheng and Li (2019) in Taiwan found long-term gains in loyalty and satisfaction through career coaching. Roberts and Campbell (2020) in Australia emphasized that clear career path communication increased retention by 40%, and Moyo and Mpofu (2021) in South Africa linked career interventions to a 25% turnover reduction. Finally, Kim and Park (2022) in South Korea found that integrated career programs—training, mentorship, and counseling—significantly improved employee retention by fostering engagement and organizational loyalty.

Career Guidance & Counselling and Employee Retention

Table 4.10 shows a significant positive relationship between career guidance and counselling (CGC) and employee retention ($r = 0.266$, $p < .05$). Evidence from multiple studies demonstrates that CGC initiatives enhance employees' job satisfaction, engagement, and loyalty by aligning personal career goals with organizational objectives. Coetzee and Stoltz (2020) found that career guidance fosters belonging and

purpose, improving retention in South African banks. Similarly, Chen et al. (2020) revealed through a longitudinal study that employees who received counselling had higher engagement and lower turnover. Abbas et al. (2020) emphasized that CGC programs—such as personalized coaching, skills workshops, and career assessments—help employees clarify goals and enhance competencies, thereby increasing retention. Further, Ahmed et al. (2021) showed that continuous skills development through CGC promotes professional growth and reduces turnover. In Egypt, Shalaby, Tzafir, and Dolan (2021) found that counselling improves job satisfaction and commitment, while Hussain and Ahmed (2020) noted that CGC fosters supportive communication and strengthens the psychological contract between employees and management. International studies confirm similar outcomes. Smith and Lee (2019) found that regular career counselling increased U.S. bank employees' retention by 20%, and Gupta and Sharma (2020) reported an 18% reduction in turnover through career guidance in Indian banks. Jones et al. (2021) observed that personalized counselling reduced turnover by 22% in Europe, while Liu and Wang (2022) found that employees in Chinese banks who received CGC were 25% more likely to stay. Likewise, Ndlovu and Moyo (2023) concluded that counselling in South African banks improved job satisfaction and commitment, lowering turnover by 20%. Overall, the studies demonstrate that effective career guidance and counselling enhance retention by improving career clarity, fostering engagement, supporting skill development, and strengthening employees' emotional and professional connection to their organizations.

Career Growth and Employee Retention

Table 4.11 indicates a positive and significant relationship between career growth and employee retention ($r = 0.316$, $p < .05$). The evidence consistently shows that employees are more likely to stay with organizations that provide clear, transparent, and attainable career advancement opportunities. Thiriku and Were (2021) found that transparent promotion paths in Kenya's banking sector enhance perceptions of fairness and organizational justice, fostering retention. Similarly, Malik and Khalid (2021) revealed that career growth and skill development initiatives in Pakistan's banks improve both performance and loyalty. Juhdi et al. (2022) emphasized the role of managerial support in helping employees realize their career aspirations, which strengthens organizational commitment. Research across various regions reinforces these findings. Kumar and Gupta (2019) and Wang et al. (2020) showed that structured career development programs and defined progression pathways increase retention by 25–28%. Smith and Johnson (2018) found

that clear advancement prospects make employees 30% more likely to stay, while Jones and Brown (2021) noted that promotions and lateral career moves reduce turnover intentions by 20%. In Nigeria, Adeyemi and Ogunleye (2022) confirmed that visible career growth opportunities boost job satisfaction and commitment, while Lopez et al. (2023) found that Latin American banks with strong career programs—such as mentorship and professional development—record significantly lower turnover rates. Cheng and Li (2019) further observed that employees with access to career growth opportunities were 35% more likely to remain loyal to their organizations. **Overall**, the studies conclude that career growth is a critical determinant of employee retention. Transparent promotion systems, continuous learning, and strong managerial support foster fairness, motivation, and long-term loyalty among banking employees.

Soft Skills and Employee Retention

Table 4.12 indicates a significant positive relationship between soft skills and employee retention ($r = 0.322$, $p < .05$). Studies consistently show that employees with strong interpersonal, communication, and emotional intelligence skills are more likely to remain loyal to their organizations. Zhang and Zhou (2018) found that soft skills foster positive relationships and reduce turnover through improved workplace rapport and satisfaction. Similarly, Deery and Jago (2020) revealed that employees with strong communication skills perform better, feel more valued, and show increased loyalty, while Kundu and Lata (2022) noted that continuous soft skills training significantly lowers turnover rates. Research on emotional intelligence—by Goleman, Boyatzis, and McKee (2022) and Ndlovu and Moyo (2022)—shows that emotionally intelligent employees handle stress and conflict better, leading to higher job satisfaction and retention. Hurrell, Scholarios, and Thompson (2022) further observed that recognizing and rewarding soft skills boosts commitment and reduces attrition. Boyatzis (2020) and Bersin (2019) emphasize that integrating soft skills into training, recruitment, and performance systems enhances morale, teamwork, and organizational agility. Empirical evidence from Smith and Brown (2019), Gupta and Sharma (2020), and Wang et al. (2021) shows that communication, teamwork, and problem-solving skills respectively improve retention by 20–25%. Overall, the literature confirms that soft skills—especially communication, emotional intelligence, and teamwork—are critical drivers of job satisfaction, organizational commitment, and employee retention in the banking industry.

Career Mentoring and Employee Retention

The findings from Table 4.13 show a significant positive relationship between career mentoring and employee retention ($r = 0.265$, $p < .05$). Research consistently indicates that mentoring enhances job satisfaction, organizational commitment, and loyalty among employees. Studies by Allen et al. (2019) and Kram (2020) emphasize that mentoring helps employees clarify career goals, gain organizational insight, and develop essential skills, thereby fostering commitment and reducing turnover. Similarly, Nguyen and Nguyen (2019) found that integrated mentoring and training initiatives significantly lower turnover rates, while Higgins and Kram (2021) highlight that supportive mentoring enhances satisfaction and retention. In the Nigerian context, Okurame (2020) revealed that mentored bank employees demonstrated greater job satisfaction and commitment than those without mentors. International studies also support this view—Smith and Johnson (2020) (U.S.), Gupta and Singh (2021) (India), and Wang and Li (2022) (China) all found that mentored employees were 25–30% more likely to remain with their employers due to improved career guidance and support. Further, Scandura and Williams (2019) and Allen, Eby, & Lentz (2021) confirmed that mentoring provides both career development and psychosocial benefits, creating a positive work environment and long-term retention. Viator (2023) concluded that comprehensive mentoring programs that blend career and emotional support are the most effective in retaining skilled employees. In essence, career mentoring strengthens employee satisfaction, fosters professional growth, and builds organizational loyalty—making it a vital strategy for talent retention in the banking sector.

Conclusion

The study concludes that various career development initiatives significantly influence employee retention. Career interventions—programs designed to support employees' development and advancement—were found to positively affect retention by enhancing motivation and commitment. Career guidance and counseling also play a crucial role, as they help employees identify their strengths, weaknesses, and career goals, leading to greater job satisfaction and loyalty to the organization. Career growth opportunities, such as promotions, skill development, and increased responsibilities, further strengthen retention by giving employees a sense of progress and recognition. Similarly, soft skills like communication, teamwork, and problem-solving were shown to enhance collaboration and satisfaction, thereby encouraging employees to remain with the organization. Finally, career mentoring emerged as a key factor in employee retention. By connecting employees with experienced

mentors who offer guidance, support, and insight, organizations help staff develop professionally and feel more valued. Overall, the study highlights that fostering employee development through career interventions, guidance, growth opportunities, soft skills, and mentoring leads to higher satisfaction, stronger commitment, and reduced turnover.

Recommendations

Based on the above research findings and the conclusion drawn therefore, the following recommendations were made,

- i. Banks should establish career intervention programs to identify employees' strengths, weaknesses, and career

iyayidominic2275@gmail.com

Publication Date: 2025/11/28

Abstract

Public administration is not only the machinery for implementing state policies but also a reflection of the broader political economy within which it operates. Its capacity to drive socio-economic development depends largely on the quality of governance and the structural dynamics of the state. Thus, understanding the relationship between public administration and political economy is necessary to explain the successes and limitations of administrative reforms in Nigeria and beyond. This review critically examines the interplay between public administration and the political economy of Nigeria. It highlights how governance structures, political processes, and economic systems interact to shape administrative effectiveness, drawing from the contexts of developed, developing, and underdeveloped countries for comparative insights. Key issues discussed include impact of federal character and revenue allocation, federalism and intergovernmental relations, and prebendal pressures in bureaucratic practice well as the corruption, weak institutions, patronage politics, and resource mismanagement. The article also draws on historical antecedents, contemporary trends, and selected case studies in administrative reform and political economy. The analysis emphasizes that overcoming these challenges requires reforms in both administrative systems and economic policies. Strengthening governance structures and supporting public administration with sustainable economic strategies are essential to achieving long-term national development.

Keywords: Public Administration, Political Economy, Governance, Nigeria, Development, History

Introduction

Public administration is the principal mechanism through which governments translate political mandates into tangible services, regulatory frameworks, and social order. In Nigeria, the relationship between public administration and the broader political economy is complex, shaped by historical legacies, resource dependence, constitutional design, and sociopolitical dynamics. As a developing federal state with a rentier revenue structure, Nigeria's administrative systems operate in an environment where political incentives and economic realities heavily influence bureaucratic behavior (Ake, 1981; Joseph, 1987).

The purpose of this paper is to critically examine the conceptual foundations of public administration, the nature of Nigeria's political economy, and the implications of their interaction for governance outcomes. It also integrates theoretical perspectives

Literature Review

Conceptual Framework

Public Administration

Public administration denotes both the application and the study of the principles of administration within a political setting. It involves the harnessing and utilization of human, financial, and material resources to implement government policies and programmes aimed at achieving specified objectives, such as national development (Remigius et al., 2025). Public administration takes place across a variety of institutional settings: public or private including universities, prisons, churches, the army, courts of justice, remand homes, business centres, and rehabilitation facilities. According to Ndukwe et al. (2023), the importance of public administration derives from its central concern with the well-being of the people. Consequently, different reform approaches have been initiated over time to improve the quality of public service delivery. Ighodalo (2018) further stresses that public administration is a major driver of socio-economic and political development in any

country. Indeed, nations desirous of genuine development invest enormous human and material resources in their public administration systems in order to enhance citizen welfare and well-being. From a classical perspective, Pfiffner and Presthus (1960, cited in Mohammed, 2024) define public administration as the process of “getting the work of government done by coordinating the efforts of people.” This definition underscores its dual character as both theory and practice, an amorphous but comprehensive field of inquiry aimed at promoting superior understanding of government and its relationship with society. Its main objective remains the advancement of management and policies so that government can function effectively. Building on this foundation, Denhardt and Denhardt (2015) identify three broad phases in the evolution of public administration:

1. The Classical Period, which emphasized a strict politics–administration dichotomy (Wilson, 1887).
2. The New Public Management (NPM) phase, which introduced market-based principles, efficiency metrics, and business-like practices into public service.
3. The New Public Service (NPS) model, which prioritizes democratic governance, transparency, and citizen participation.

Nigeria’s administrative practice reflects a hybrid of these models. While modern reforms are formally adopted, their full implementation is often constrained by entrenched political economy dynamics, such as patronage systems, rent-seeking, and weak institutional accountability.

Brief History of Public Administration in Nigeria

From the colonial civil service to post-independence reforms, Nigeria’s public administration has originated with mixed outcomes. Initially designed as an instrument of colonial control, it later became a mechanism for state-building. Despite reforms, persistent issues such as over-centralization, lack of accountability, corruption, and ethnic politics continue to undermine administrative efficiency (Ayoade, 1988; Gboyega, 1992).

Public administration in Nigeria can be broadly understood through three historical phases: the pre-colonial era, the colonial period, and the post-independence era. Each stage reflects a blend of indigenous traditions, British colonial legacies, and subsequent reforms shaped by political regimes (Adamolekun, 2002).

Pre-Colonial Era (Before 1900)

Indigenous Systems: Diverse ethnic groups had sophisticated systems of administration rooted in culture and tradition.

The Hausa/Fulani in the North operated monarchical systems with centralized taxation and authority.

The Yoruba in the West blended monarchy with participatory democratic practices.

The Igbo in the East relied on decentralized governance through elder councils (Ekeh, 1975).

Characteristics: These systems were largely decentralized, community-based, and relied on customary rulers and councils for decision-making.

Colonial Period (1900–1960)

Indirect Rule: The British governed through traditional rulers, reinforcing existing power structures (Crowder, 1964).

Colonial Superstructure: A hierarchical civil service was introduced at the central level, creating a dual system of indirect rule and bureaucratic administration.

Nigerianization: By the late 1940s, steps were taken to gradually transfer administrative responsibilities to Nigerians (Famoriyo, 1984).

Local Government Reforms: In response to nationalist criticism, reforms in the late 1940s and early 1950s aimed at modernizing local governance and reducing the excesses of indirect rule (Adebayo, 1981).

Post-Independence Era (1960–Present)

Colonial Legacy: Nigeria inherited the British administrative framework at independence in 1960 (Adamolekun, 1985).

Reforms and Restructuring: Successive governments—both military and civilian—undertook reforms to modernize the civil service and restructure local government.

Independence Era (1960–1966): Early efforts focused on consolidating administrative institutions (Ayoade, 1988).

Military Rule (1966–1999): Characterized by frequent restructuring, centralization of authority, and inconsistent reform outcomes (Gboyega, 1992).

Democratization (1999–Present): The Fourth Republic introduced reforms under successive administrations to enhance efficiency, reduce corruption, and professionalize the civil service (Olaopa, 2014).

Contemporary Challenges: Despite these efforts, Nigeria’s public administration continues to grapple with inefficiency, weak institutional capacity, corruption, and the need for genuine decentralization to empower local governments (Suberu, 2001).

Political Economy

Political economy refers to the interrelationship between political processes and economic systems, particularly how political institutions influence

economic outcomes and vice versa (North, 1990). For Nigeria, two frameworks are especially relevant:

Rentier State Theory: As Ake (1981) and Beblawi & Luciani (1987) explain, rentier states derive a significant share of revenues from external rents such as oil exports. This structure reduces the fiscal need to tax citizens, thereby weakening accountability mechanisms.

Prebendalism: Joseph (1987) describes Nigeria's political culture as prebendal, where public offices are treated as entitlements to be exploited for personal and group benefit, distributing state resources among clients, kin, and constituents.

Rentier State Syndrome: Nigeria's economy is overwhelmingly dependent on oil revenues, which account for over 80% of government revenue and over 90% of export earnings (CBN, 2023). This dependency has created a rentier state model where economic productivity is sidelined in favor of distributing oil rents through political channels. According to Mahdavy (1970), rentier states tend to develop weak institutions because the ruling elite rely on external rents rather than taxation, thus weakening the accountability relationship between the state and its citizens.

Elite Dominance and Political Patronage: Political elites in Nigeria often capture public institutions for personal or group interests. Public administration is heavily influenced by patronage networks, whereby appointments and promotions are based on loyalty rather than competence (Agbaje, 1999). This practice undermines institutional efficiency and creates an environment where corruption thrives.

Ethno-Religious Politics: Nigeria's political landscape is fragmented along ethnic and religious lines. This fragmentation influences public sector appointments, federal resource allocation, and policy implementation. Ethno-religious politics often leads to conflict, weakens national identity, and undermines the legitimacy of public institutions (Osaghae, 1998). Abagen and Shom (2023) stated that political economy was simply referred to as economics in the 19th century. In other words, throughout the time of the classical economists, the terms "economics" and "political economy" were interchangeable. Therefore, it implies that political economics went through a number of stages before reaching the current level of discourse.

The Relationship between Public Administration and Political Economy

Public administration and political economy are deeply interconnected because administration functions within a political and economic environment shaped by power, resources, and institutions. Public administration refers to the organization, coordination, and implementation of government policies and programmes, while political economy studies how political forces and economic interests interact to shape policy outcomes and resource distribution. Political economy provides the context, and public administration provides the machinery through which governance is exercised.

The influence of political economy on public administration is clear in how political institutions and interests determine administrative design and performance. Political patronage, rent-seeking, and weak accountability systems often distort the neutrality of the civil service, reducing efficiency and effectiveness (Cooper & Reggie, 2025). For instance, in South Africa, political interference in administrative appointments has undermined service delivery, demonstrating how political economy directly constrains bureaucratic performance (Mogashoa, 2023). Conversely, the quality of administration influences political economy outcomes. Where bureaucracies are transparent, meritocratic, and efficient, they contribute to economic development, equity, and legitimacy of governance. Evidence from Vietnam demonstrates that local administrative effectiveness and transparency significantly boost economic growth, proving that administrative capacity is not only a political tool but also an economic driver (Nguyen et al., 2022).

Historically, public administration theory attempted to separate politics from administration, as seen in Wilson's (1887) politics-administration dichotomy. However, later scholarship has shown that the two are inseparable. Policy choices emerge from political economy contests, where interest groups, ideologies, and institutions compete, and administrators transform these into implementable programmes (Sha, 2022). This demonstrates that public administration is not simply technical but operates within a field of power relations. Moreover, administrative values reflect broader political economy choices. Denhardt and Denhardt (2015) argue that the New Public Service model reframes citizens as active participants rather than passive clients, emphasizing democracy, transparency, and collaboration as integral to governance. Similarly, public administration studies highlight that ethical and political values such as sustainability, fairness, and equity are central to administrative decision-making (Sager & Rosser, 2021). In Nigeria, the relationship between public administration and political economy is particularly evident. Despite adopting reforms such as SERVICOM

and anti-corruption measures, entrenched political economy structures including patronage, ethnicity, and rentier politics have limited the effectiveness of administration. While Nigeria invests enormous resources in its bureaucracy for national development (Ighodalo, 2018), reform outcomes remain modest because they do not adequately address the underlying political economy incentives that sustain inefficiency and corruption.

On the other hand, political economy provides an important context for understanding these administrative challenges. Abagen and Shom (2023) note that in the 19th century, “political economy” was simply referred to as “economics.” During the era of the classical economists, the terms were used interchangeably, reflecting the inseparable connection between politics and economics. Over time, however, political economy evolved through various stages, developing into a distinct discourse concerned with how political forces shape economic outcomes, and vice versa.

Interrelationships between Political Processes and Economic Systems

The interrelationship between politics and economics is best understood as reciprocal: political processes determine the rules of the economic game, while economic outcomes reshape the legitimacy, stability, and evolution of political institutions. The balance differs across contexts — stable and inclusive in developed states, vulnerable but reform-oriented in developing ones, and fragile in under-developed states. Political processes and economic systems are deeply interconnected and mutually reinforcing. Political institutions, policy choices, and stability directly shape economic structures, while economic distribution, sectoral composition, and performance influence political behaviour, legitimacy, and institutional development.

However, Political Processes Shaping Economic Systems as follow:

First, institutions and policy credibility strongly affect economic performance. Strong legal frameworks, rule of law, and independent regulatory agencies lower transaction costs and create incentives for long-term investment (World Bank, 2024). Conversely, weak or unpredictable institutions increase uncertainty and discourage capital inflows.

Second, state capacity and public finance determine the extent to which governments can mobilize resources for development. Effective tax systems and efficient expenditure allow states to build infrastructure, expand education and health services, and promote industrialization. Countries with weak fiscal capacity often fall into cycles of low investment and poor human development (OECD, 2024).

Third, political stability influences growth. Empirical evidence shows that political instability, such as frequent government turnover or contested elections, reduces investment and slows GDP growth in both developed and developing economies (Dirks, 2024). Stable political environments support policy continuity, which is essential for sustained growth.

On the other hand, economic structures also influence political dynamics. Distributional outcomes of economic growth shape electoral behavior and coalition formation. Rising inequality is linked to declining trust in democratic institutions and the rise of populist movements in advanced economies (OECD, 2024).

The sectoral composition of an economy also matters. Resource-dependent economies often encourage rent-seeking and clientelism, while diversified industrial economies foster broader coalitions that sustain stable, rules-based governance (Hall & Soskice, 2001).

Moreover, external economic shocks such as commodity price fluctuations or global financial crises frequently reconfigure domestic politics. For example, trade shocks in developing countries often provoke protectionist or populist responses that reshape policy priorities (World Bank, 2024).

The Contexts of Developed, Developing, and underdeveloped countries

In developed countries, political processes typically focus on redistribution, social welfare, and technological regulation within the framework of robust institutions. Economic systems, in turn, provide the fiscal base and legitimacy to sustain democratic contestation (OECD, 2024).

In developing countries, weaker institutions and limited fiscal capacity often constrain policy effectiveness. Political incentives may favor short-term clientelist spending rather than long-term investment, making these economies highly vulnerable to global shocks (World Bank, 2024).

In under-developed countries, the relationship becomes a vicious cycle: weak political authority undermines economic performance, while poor economic outcomes further erode legitimacy. UNDP (2023) emphasizes that breaking this cycle requires simultaneous state-building and economic development, prioritizing legitimacy and service delivery before rapid liberalization.

Federal Character and Revenue Allocation

The 1999 Constitution institutionalizes the federal character principle (s.14 [3]) to ensure representation of Nigeria’s diverse ethnic and regional groups in public appointments. It also establishes the Federation Account (s.162), which centralizes revenue collection and redistribution to federal, state, and local

governments. While designed for inclusivity and unity, these mechanisms influence recruitment, promotion, and spending priorities in ways that sometimes conflict with merit-based and efficiency-driven administrative models.

Nigeria's Political Economy and Public Administration

i. Resource Dependence and Fiscal Politics

Nigeria's fiscal structure is dominated by oil, which contributes over 50% of government revenues and more than 80% of export earnings (Nigerian Extractive Industries Transparency Initiative [NEITI], 2023). This dependence encourages distributive politics—allocating oil rents via the Federation Account—rather than cultivating a robust domestic tax base (Ake, 1981). Administrative agencies therefore focus on disbursement rather than revenue generation, leading to cyclical budget instability during oil price shocks. Fiscal policy is essentially concerned with manipulating the financial operations of the government to achieve certain economic policy objectives. In other words, it involves government decisions to vary key fiscal aggregates such as total government spending and tax revenues, as opposed to other aspects of public finance that focus mainly on the effects of specific government expenditures and taxes (Stein, 1968, in Babalola, 2015). According to Oye and Alege (2022), citing the World Bank (2014), fiscal and monetary policies are the two most significant tools available to policymakers in guiding an economy towards attaining desired macroeconomic objectives. Both are essential for maintaining macroeconomic stability and ensuring medium- to long-term economic growth and welfare.

In Nigeria, the interaction between fiscal and monetary policies is particularly important due to the need for alignment between the Central Bank of Nigeria (CBN) and the Federal Ministry of Finance (FMF). The CBN and the FMF are independent institutions responsible for monetary and fiscal policies respectively. However, under the CBN Act of 2007, the Bank is granted operational independence to direct monetary policy using its instruments. Despite these frameworks, the management of the Nigerian state in recent times has failed in its constitutional obligation to secure lives, protect property, and ensure an enabling environment for economic activities (Ogundiya & Titus, 2024). Insecurity has deeply affected the country, disrupting social relations, politics, and the economy. Similarly, Ozoh and Dinwobi (2018) emphasize that this unpalatable situation has posed serious challenges to Nigeria's socio-economic development.

ii. Prebendal Pressures in Bureaucratic Practice

Joseph's (1987) analysis remains relevant in explaining Nigeria's administrative patterns:

Political appointments are often influenced by ethnic and regional balancing.

Civil service postings and promotions may be driven by patronage networks.

Budget allocations are sometimes distributed thinly across constituencies to satisfy multiple stakeholders, reducing economies of scale in public investment.

iii. Federalism and Intergovernmental Relations

The Federation Account's design means that states and local governments rely heavily on federal transfers. This limits the incentive for subnational tax reform and encourages political bargaining over revenue sharing formulas. Federal ministries must often rely on conditional grants and negotiated compacts to influence subnational service delivery in sectors like health and education (Constitution of the Federal Republic of Nigeria, 1999).

8. Case Studies in Administrative Reform and Political Economy

1. The Petroleum Industry Act (PIA) 2021 and NNPC Limited

The PIA (NUPRC, 2021) marked a watershed in Nigeria's oil governance, converting the Nigerian National Petroleum Corporation into NNPC Limited—a commercially oriented entity under the Companies and Allied Matters Act. The Act introduced clearer fiscal rules, corporate governance structures, and revenue-sharing arrangements. For public administration, the reform sought to:

- Separate policy-making from commercial operations.
- I. Enhance transparency through audited financial reporting.
- II. Reduce political interference in operational decisions.

Host Communities Development Trusts (HCDTs)

The PIA also mandated the creation of HCDTs funded by 3% of oil companies' operational expenditure. This mechanism institutionalizes corporate–community relations into a rule-bound administrative framework with boards, management committees, and audit requirements (NUPRC, 2022). Properly implemented, it can reduce community unrest and oil infrastructure sabotage, enhancing both administrative stability and economic performance.

Social Protection amid Inflationary Pressures

The removal of fuel subsidies in 2023, alongside global commodity price spikes, sharply increased living costs (Stutern, 2023). This has pressured public administration to expand social safety nets like the National Social Investment Programme.

Implementation challenges—such as targeting accuracy, digital payment infrastructure, and monitoring—highlight the capacity constraints of Nigeria's bureaucratic apparatus in times of economic crisis.

Challenges of Public Administration in Nigeria

Politicization of the Civil Service: The Nigerian civil service is often undermined by political interference. Political leaders interfere with recruitment, promotions, and policy decisions, making it difficult for civil servants to operate with professionalism and neutrality. This politicization erodes public trust and reduces administrative efficiency.

Corruption and Lack of Accountability: Corruption remains pervasive across all levels of public administration. Embezzlement of funds, contract inflation, bribery, and nepotism are rampant. Despite the establishment of anti-corruption agencies such as the Economic and Financial Crimes Commission (EFCC) and the Independent Corrupt Practices Commission (ICPC), enforcement is often selective and politically motivated (Transparency International, 2023).

Poor Budgetary Implementation: Nigeria's annual budgets are often unrealistic and poorly implemented. Over 70% of the national budget is allocated to recurrent expenditure, leaving little room for capital projects. Budget delays, inflated contracts, and lack of performance monitoring further hinder the effectiveness of public spending (BudgIT, 2023).

Weak Institutions and Regulatory Frameworks: Most public institutions lack autonomy, capacity, and the necessary tools for effective service delivery. Regulatory agencies are often underfunded and compromised by political interference. This institutional weakness results in poor policy implementation and limited oversight (World Bank, 2022).

Insecurity and Governance Deficits: Rising insecurity—including terrorism, kidnapping, and banditry has disrupted public administration in many regions of the country. Government presence is minimal in conflict zones, and public servants often fear working in volatile areas. This insecurity undermines national development and service delivery.

Recommendations for Administrative Efficiency

The Nigerian case illustrates that administrative efficiency cannot be divorced from political economy realities. Key recommendations include:

Revenue accountability link: Expanding domestic taxation could strengthen citizen oversight and improve performance incentives for public agencies (Ake, 1981). Balancing inclusion and merit: Federal character provisions must be implemented transparently to avoid undermining competency-based recruitment (Joseph, 1987).

1. Rule-bound resource allocation: Instruments like the HCDT can insulate some spending streams from political capture, improving service delivery predictability (NUPRC, 2022).
2. Strengthened intergovernmental collaboration: Given constitutional constraints, performance-based grants could be used to align state and federal priorities in service delivery.
3. Diversify the economy beyond oil.
4. Professionalize the civil service with merit-based recruitment and promotion.
5. Deepen democratic governance and citizen participation.
6. Implement sustainable public sector reforms.

Conclusion

Public administration is not only the machinery for implementing state policies but also a reflection of the broader political economy within which it operates. Its capacity to drive socio-economic development depends largely on the quality of governance and the structural dynamics of the state. Thus, the understanding of both public administration and political economy is necessary to explain the successes and limitations of administrative reforms in Nigeria and beyond. Public administration in Nigeria operates within a political economy defined by oil dependence, prebendalism, constitutional federalism, and distributive politics. Reforms like the PIA and targeted social protection illustrate that structural changes are possible, but success depends on insulating administrative processes from excessive political manipulation while improving fiscal accountability. The interaction between Nigeria's political economy and its administrative system will continue to determine the effectiveness of governance and the prospects for sustainable development.

Public administration cannot be understood in isolation from political economy. Political economy provides the incentives, power relations, and institutional constraints that shape administrative performance, while public administration influences political economy outcomes by determining whether governance delivers growth, equity, and legitimacy. Effective reform requires addressing both sides: strengthening administrative capacity while reshaping political economy dynamics to foster accountability, transparency, and sustainable development.

Abstract

Rural development is at the heart of sustainable national development of developing nations. It is a means of ensuring that the rural sector of the population have fair share of socioeconomic activities and gains that makes life habitable for rural populace without resulting to mass rural-urban migration in search of social amenities and quality life. As such, public policies should drive rural development as pragmatic means towards providing public facilities and economic opportunities for the relative comfort of rural dwellers. However, due to absence of well articulated programme or poor implementation or inconsistency of policy programme on rural development, there has been much variation in the administration and performance of rural development programme in Nigeria. The efforts made by successive governments have been at its worse more of propaganda as much of the rural areas are rather characterized by dearth of infrastructure, roads, health, water and poor electricity supply including the impacts of all of these on food production. Meanwhile, there has been a federal government initiative for rural development through agriculture called FADAMA. FADAMA is a World Bank assisted programme designed to promote simple and low cost improved agricultural technology and farm support for rural farmers. This paper is an appraisal of this FADAMA program especially that since 2017 that FADAMA III terminated, there has not been any public expression of interest by the federal government to proceed to phase IV of the programme. Therefore, this paper is an advocacy for the resumption of the FADAMA IV program as a rural development policy through agricultural practice. The paper adopted the endogenous theory of rural development and utilized historical and descriptive approaches in analysing data and information sourced mainly from secondary domains. The paper found that FADAMA in its first three phases have contributed meaningfully to the transformation of rural areas in the local governments that have benefited from the program. And that whereas there were certain impediments to the full realization of its core objectives, FADAMA programs contributed to the uplifting of lives of rural farmers, their dependents and the rural populace. The impediments observed in literature include chronic political interference and serious leadership deficit at the local governments that are suppose to be the primary drivers of the programme in their areas. The paper strongly recommended the resumption of phase IV of the initiative by the Federal Government, after strengthening the legal and institutional frameworks for the design and implementation of the programme in a way that it can achieve far more results than the previous phases by transforming the lives of the rural settlers through improved agricultural interventions.

Keywords: Agriculture, Development, FADAMA program, Public Policy, Rural Development, Rural Populace,

Introduction

Development is a necessary aspect of societies, indeed any society without development could be said to be static. Hence all societies are dynamic. Sustainable development for its part involves the use of natural resources as well as national infrastructures in such a way as to avoid the exhaustion of those resources. Rural socio-economic transformation is a means of ensuring that the rural sector of the population has some share in the fruits of economic activity. It is the most pragmatic means of bringing government facilities and services to the door steps of the population of rural areas. But rural areas are rather characterized by dearth of infrastructure, roads, health, water and poor electricity supply.

It is an eyesore that development efforts over the years have been in favour of urban centres, leaving the rural areas devoid of modern attractions that characterize the urban centres with huge differentials in employment, income, power, education, health and general material well-being between urban and rural areas in Nigeria. The rural economy depends much on road transportation in that it facilitates agricultural and other socio-economic activities, the provision and maintenance of the access roads is a sine qua non for the development of the rural economy, most especially the development of a small scale business which has been recommended as strategy for improving the rural economy hinges on access roads (Aliyu 2004). Due to the lack of a well articulated programme on rural development, there has been much variation in the administration and performance of rural development programme in Nigeria.

Efforts made by successive Nigerian governments have been at its worse more of propaganda. Indeed it is safe to say that Nigeria has no rural development programme until 1976 when national strategy for rural development was first initiated (Kamar et al, 2014). Before this time, governments idea of plough back some revenue to the rural sector was through; large sales plantation of cocoa, rubber, oil palm, subsidy approach which allows the public sector to provide infrastructure which include transport and

irrigation facilities and that of agrarian called reform in a package called "Integrated Rural Development" (IRD) (Agwunobi, 1993).

Since Nigeria gained her political independence in 1960, there has been a less impetus attached to the rural community development as a factor that advances the overall socio-economic development of a developing country like her. Althoguh, Alege (2005) observed that governments at different times had set up various programmes and specialized credit institutions in an attempt to transform and develop rural areas in all its ramifications and thereby moving rural dwellers from abject poverty and squalor to economic and social prosperity and while some of those programmes and credit institutions are yet on-going, some are moribund and others have gone with the regimes that initiated them. Even though successive governments have indicated desire to transform the country, be it in terms of provision of infrastructure, human capacity development and even in the realm of social cum political development particularly in the rural areas. In this wise, Nigeria has experimented with several development plans from pre-independence era till date.

Ebienfa and Paki (2013) observed that policies play crucial role in rural development and underdevelopment. Whereas, there has been no lack of public policies in Nigeria since independence, the paradox of public policy implementation has continued to militate cum mar the realization of public objectives in the country. The reason being that most government policies either end prematurely only at the formulation stage; or are purposely designed not to be religiously implemented or simply ill-implemented to benefit only a section of the society.

Okhankhuele and Opafunso (2013) claimed that several methods to remove rural-urban development gap have been carried out in Nigeria with little success, therefore the rural areas still remain highly underdeveloped in comparison with the urban areas. They believed that numerous studies have been carried out on the causes and consequences of rural-urban migration and also related the consequences of rural-

urban migration on the urban centers to serious problems such as overpopulation, insufficient physical and social infrastructural amenities. Some of the past studies linked the causes of rural-urban migration to unbalanced government policies in support of urban development, response to disparities in income, employment and other socioeconomic services available within the metropolitan and country sides, with the urban areas being fortunate. Others associated it with impulsive, emotional, structural, and traditional factors (Paul et al, 2014).

Moreover, it can be deduced that the cost of depopulation of rural areas is in reduction of rural agricultural produce. Agriculture is the engine that stimulates economic processes when it comes to national development. Historical facts show that before the oil boom in the 1970s, agriculture was the mainstay of Nigeria's economy. Each region was known for a particular agricultural produce – the Northern region was known as groundnut pyramid; Western region for cocoa, one of the world best commercial viable seeds; the Eastern region was the home of palm nut and cassava, and collectively, the proceeds from these agricultural products made Nigeria the beauty of Africa.

The enormous challenges befalling the rural areas prompted the Nigerian government to inculcate many programmes and policies at the various level of government. For example, in 1993, the federal government of Nigeria in collaboration with the World Bank and State government started a new programme referred to as the National Fadama Development programme. This in an attempt to alleviate poverty among rural Nigerians and also to increase the incomes and productivity of the rural inhabitants as an approach of meeting up with the millennium development goals (MDGs) of food sufficiency, poverty eradication and development of the rural areas. The First National Fadama Development Programme (FADAMA I) is a World Bank assisted programme designed to promote simple and low cost improved irrigation technology. The widespread adoption of the technologies enabled farmers to increase production. Federal government impressed by the achievements,

approached the African Development Fund (ADF) of the African Development Bank (ADB) for support in expanding the achievement of Fadama in scope and size. This led to the formation of Fadama II programme (Agbarevo and Okwoche, 2014).

This paper thus took a look at the FADAMA III projects in Nigeria and challenges to its implementation. In other words, the paper takes a critical look at major strategies, approaches or theories taken so far by Nigerian governments with FADAMA III to change the rural landscape and what has been their practicability in terms of social change and improving the socioeconomic well-being of the rural poor.

Literature Review

The paper adopted a conceptual review approach to exploration of extant literature on its subject. It reviewed the concepts of public policy and rural development. For public policy different definitions are abound, and it may simply be futile trying to discover which is correct or proper. One of the widely quoted definitions of public policy is that of Dye (1979:1), where he defines public policy as “what Government choose to do or not to do. He went further to explain that:

Government do many things, they regulate conflicts within society, they organize society to carry on conflicts within other societies, they distribute a great variety of symbolic rewards and material services to members of the society and extracts money from the society, most at times in the form of taxes. Thus policies may regulate behavior, organize bureaucracies, distribute benefits, extract taxes, or all of these things at once..(Dye 1979).

Egonwan (2004) sees Public policy is a future oriented inquiry into the optimum means of achieving a given governments programme found in a nation's laws or in public statements by a functioning of government. Other conceptualization of public policy includes; it is a government programme of action which stands for various degrees of total articulation and normative regulations of government activities, that is what government intends to do to it.

Shankansky (1970) contended that, public policy refers to important activities of government. The reality however is that public policy embraces all government activities or outputs as it affects members of the society, and cannot be limited only to important activities of government. Public policy is also defined as a purposive course of action followed by an actor or set of actors in dealing with a problem or matter of concern.

For Nnajofofor et al (2013), public policy has to do with the fact that, it is a product of government process and activities; it affects a large spectrum of issues and sectors of the society which government have something to do. This includes the economy, housing, defense, transportation, health care, education, etc. and expression of public policy embraces, laws, judicial decisions, executive orders and rules government budgets, organizational directives or any rule of conduct behind which stands the enforcing power of the principal system.

Public policies are in essence designed to resolve societal problems. Particularly those considered to require public or collective action. Again public policies can be categorized as being distributive, regulatory and constituent respectively in accordance with the purpose they are created to serve in the society. Henry (2005) offered a dimension that sees public policy as a course of action adopted and pursued by government. This view does not tell us the philosophical basis of this government course of action. It is in this light that Ikelegbe (2006) analysed public policies are made by among others; political institutions such as: parliament, political executive, political parties and the judiciary.

Akhakpe (2014) made the point that in representative democracy, the enterprise of public policy making and implementation are facilitated and made wholesome by non-governmental actors and agencies which can be referred to as interest groups. In advanced democracies, they play principal roles in ensuring that their members' interests are factored into every policy coming from government. In the United States of America, government officials desirous of the success of government policies, go out of their way

to ensure that the interests of these groups are sought and represented in major government policies. To bridge the gap in popular representation created by the movement from direct to indirect democracy, consultations with stakeholders on every policy issue are required for such policies to get the support of the targeted group and its effectiveness realized.

Honadle (1976) identifies the problems associated with policy implementation as that of social carpenters and masons who fails to build to specification and thus distort the beautiful blueprint. He was equating policy with a building plan. To this he said:

Implementation is the nemesis of designers; it conjures up images of plans gone awry and of social carpenters and masons who fails to build to specifications and thereby distort the beautiful blueprints for progress which were handed to them. It provokes memories of "good" ideas that did not work and places the blame on the second (and second-class) member of the policy an administrative images..." (Honadle 1976:21).

Nnajofofor et al (2013) argued that the above quotation shows the importance that is attached to policy implementation and those that are responsible for implementing these policies. It also shows that no matter how beautiful the blueprint of a programme is, a defective implementation of it will make nonsense of the whole programme. Unfortunately, the situation as described by Honadle (1976) is what goes on in most developing countries including Nigeria.

The concept of rural development on the other hand is often synonymous with agricultural development; others views it from a much more comprehensive stand point which includes; the creation of opportunities and incentives for savings, credits and investment at the local level for the provision of rural facilities, roads, agro-industries and agro-services centre. Rural development is therefore a concerted effort to increase production, create and spread employment as well as rooting out fundamental causes of poverty, ignorance, hunger and diseases Akpomovie (2010). It is aimed at awakening in the people the

urge to develop their own potentials for progress in order to achieve sustainable development.

In the view of Abdulrazak et al (2015), rural development is a comprehensive mode of social transformation, a socioeconomic change seeking to bring about more equitable distribution of resources within the society, and a veritable acceptance of the principle of growth from below. This emphasized on the need to ensure socioeconomic balance and equitable distribution of wealth and resources among people and among the rural populace. Failure to do so makes an economy yet underdeveloped. Nigeria for example experienced an unprecedented economic growth in recent times; but without commensurate development.

Olayide et al. (1981) see rural development as a process whereby concerted efforts are made in order to facilitate significant increase in rural resources productivity with the central objective of enhancing rural income and creating employment opportunity in rural communities for rural dwellers to remain in the area. It is also an integrated approach to food production, provision of physical, social and institutional infrastructures with an ultimate goal of bringing about good healthcare delivery system, affordable and quality education, improved and sustainable agriculture etc. According to Van der Ploeg et al. (2000), rural development is reconstructing the eroded economic base of both the rural economy and the farm enterprise... (and) represents the well understood self-interest of increasing sections of rural population.

Paul et al (2014) believed that rural development is action that helps people to recognize and develop their ability and potential and organize themselves to respond to problems and needs which they share. It supports the establishment of strong rural community development agencies that control and use assets to promote social justice and help improve the quality of community life. It also enables community and other public agencies to work together to improve the quality of government. And for Adelakun (2013), rural development is the general process of improving the quality of life

and economic well-being of people living in relatively isolated and sparsely populated areas. He stated further that rural development has traditionally centered on the exploitation of land-intensive natural resources such as agriculture and forestry. However, changes in global production networks and increased urbanization have changed the character of rural areas. Increasingly tourism, niche manufacturers, and recreation have replaced resource extraction and agriculture as dominant economic drivers.

Lastly, Abah (2000) viewed rural development to include the provision of social and physical infrastructure, the provision of financial services in non-urban areas, non-farm and small-medium enterprises activities in rural communities and market towns that are more closely linked to the rural economy than they are to the economies of the larger urban cities, as well as the development of traditional rural sectors, such as agriculture and natural resource management. It noted the key elements that will facilitate the realization of rural development to include social infrastructure, physical infrastructure and financial services.

Theoretical Framework

This paper is anchored on the endogenous theory of development. The theory was developed in opposition to the 'modernist' notion of development. Endogenous theory of development stated that the socio-economic well-being of disadvantage areas such as the rural areas can best be brought about by recognizing and animating the collective resources of the territory (Ray 2000). According to Bassand et al (1986) the new meaning of development, that is, qualitative and structural indicators, and not just qualitative and monetary measure, are used a criteria but also cultural, social, political, and ecological value as well as social costs and long effects are combined for endogenous development.

According to Lowe et al (1998), the basic characteristics of the endogenous model of rural development are - Key Principle: the specific resources of an area i.e. (natural, human and cultural) hold the key to its sustainable development; Dynamic Force: local initiative and enterprise; Function of

Rural Areas: diverse service economies; Major Rural Development Problem: The limited capacity of rural areas and social groups to participate in economic and development activity; Focus of Rural Development: capacity building (skills, institutions and infrastructure) and overcoming social exclusion.

Ray (2000) stated that the main characteristics of endogenous development are threefold. First it sets development activity within a territorial rather than sectorial framework, with the scale of the territory being smaller than the nation-state. Second, economic and other development activities are reoriented to maximize the retention of benefits within the local territory by valorizing and exploiting local resources (physical and human). Third, development is contextualized by focusing on the needs, capacities and perspectives of local people, meaning that a local area should acquire the capacity to assume some responsibility for bringing about its own socio-economic development.

Keane (1990) points out two main ways in which endogenous development differs from exogenous: first, it is seen not only as an economic concept, but also as a process dealing with the total human condition; and second it accepts numerous possible conceptions of development and pitches the objectives and paths on an appropriate local level. He also stated that endogenous approach represents a significant change from investment on physical capital to investment in developing the knowledge, the skills and the entrepreneurial abilities of local population.

The theory of endogenous development emphasized the efficient use of rural resources to develop the rural areas, it opposed extraction, annexation and exploitation of local resources to the disadvantage of its own population.

Public Policy and Rural Development in Nigeria: an Overview of Federal Government FADAMA Programme

The FADAMA project was introduced as a strategy to tackle rural development problems “Fadama” is a Hausa word which translates to Irrigable land in English Language and it means “akuro” in Yoruba

language. Fadama can be described as a local word for low lying flood plain usually with easily accessible shallow groundwater (Balogun and Yusuf, 2011). It is especially suitable for crop irrigation and fishing which traditionally provides food and water for livelihood. Fadama also refers to a seasonally flooded area used for farming during the dry season. It is defined as alluvial, lowland formed by erosion and depositional actions of the rivers and streams. They encompass land and water resources that could easily be developed for irrigation agriculture.

Fadama are typically waterlogged during the rainy season but retain moisture during the dry season. The areas are considered to have high potential for economic development through appropriate investments in infrastructure, household assets and technical assistance. When Fadama spread out over a large area, they are often called ‘Wetlands’ (Nkonya et al 2008). The first National Fadama Development Project (NFDP-1) was established in the 1990s to promote simple low cost improved irrigation technology under the World Bank financing (Agunloye et al, 2017). The main objective of NFDP-1 was to sustainably increase the incomes of the Fadama users through expansion of farm and non- farm activities with high value-added output. The programme covered twelve’s states of Adamawa, Bauchi, Gombe, Imo, Kaduna, Kebbi, Lagos, Niger, Ogun, Oyo, Taraba including the Federal Capital Territory (FCT). NFDP adopted community driven development (CDD) approach with extensive participation of stakeholders at the early stage of the project.

The relative success recorded in FADAMA I led to the establishment of FADAMA II. The strategy for Fadama II was aimed at contributing to food security and increased access to rural infrastructure facilities. Consequently, Fadama II programme was assisted by World Bank and co -financed with loan from African Development Fund (ADF) (Agunloye et al, 2017). Fadama II was more of agricultural diversification programmes providing financing for the diverse livelihood activities which the beneficiaries themselves identify and design, with appropriate facilitation support. Fadama II was implemented in 12

States including the Federal Capital territory, Abuja. The 12 Fadama II states were carried out in three major agro-ecological Zones, the humid forest (Lagos, Ogun and Imo), moist savannah (Adamawa, FCT, Oyo and Taraba) and dry savannah (Bauchi, Gombe, Kaduna, Kebbi and Niger).

FADAMA III was introduced and implemented nation-wide from March, 2009 to December, 2013. An integral part of the Fadama III project was the provision of support to up- stream and down- stream activities aimed at streamlining input and output marketing, including ensuring efficient transportation of inputs and outputs, processing, storage (conservation/or preservation), thereby ensuring that beneficiaries' efforts translate to sustained and increased income (NFDP,2003).

FADAMA III, like Fadama II, adopted a community-driven development (CDD) approach. Under this approach, various Fadama resource users, including crop farmers, pastoralists, fishermen and women, and on –and off-farm entrepreneurs, operating through their respective Fadama user groups (FRUGs) and their apex bodies and Fadama community Associations (FCAs) would reach consensus on how to use the common resources for their mutual advantage (NFDP,2003). It also assert that through this process, communities would decide on which advisory services and infrastructures they need to enable them attain development goals they set for themselves based on their own efforts. The concensus so reached would be articulated in the local development plans (LDPs) drawn on the level of Fadama community associations.

The FADAMA III operation will support the financing and implementation of five main components designed to transfer financial and technical resources to the beneficiary groups in: (i) institutional and social development; (ii) physical infrastructure for productive use; (iii) transfer and adoption of technology to expand productivity, improve value-added, and conserve land quality; (iv) support extension and applied research; and (v) provide matching grants to access assets for income-generation and livelihood

improvements. The main objective of the Fadama III Project was to increase the income of users of rural land and water resources on a sustainable basis. By increasing their incomes, the project helped reduce rural poverty, increase food security, and contribute to the achievement of the Millennium Development Goal (MDG). The specific objectives were to:

1. Sustainably increase the incomes of Fadama beneficiaries by directly delivering resources to them (i.e. the beneficiary rural communities), efficiently and effectively;
2. Empower beneficiaries to collectively decide on how resources are allocated and managed for their livelihood activities and to participate in the design and execution of their sub-projects.

Whereas, the key indicators and targets for tracking progress toward the project development objective of Fadama III are:

1. Income of participating households: 75 percent of Fadama user households, who benefit directly from project-supported activities, would have increased their average real incomes by at least 80 percent by 2017.
2. Yields of primary agricultural products of participating households: 20 percent increase in yield of primary agricultural products of participating households.
3. Savings of participating groups: 10 percent of the replacement value of the common asset used for income-generating activities of the FUGs is saved annually (with effect from year 2).
4. Physical verification of operations, maintenance and utilization of assets at midterm and at project closing by surveys of random selected sites (NFDP, 2018)

The Project initial implementation is for period of five years, from July 2008 to June 2013 but was extended to 2017. Community organizations decide on how the resources are been allocated among the priorities that they themselves identify and they manage the funds. Extensive facilitation, training, and technical assistance were provided through the Project to ensure that poor rural communities, including women and vulnerable groups, especially the physically challenged, participate in the

collective decision-making process. The Project helps by giving voice to the communities as well as promotes the principles of transparency and accountability in planning and management of public investments within the LGAs (Bature et al 2013).

The strategic choices of FADAMA III include:

- (i) To address constraints to productive infrastructure: Inadequacies in rural infrastructure and essential support services, road access and dry season irrigation, and availability of relevant agricultural and land management technologies constrain growth and adoption of more sustainable approaches to land management. The core activities funded by this Project address this constraint.
- (ii) To improve livelihood opportunities: The Project supports productive activities, technical assistance and investment in assets and land quality and services identified by communities as relevant to generation of higher incomes and better livelihoods.
- (iii) To empower the rural poor: The poor lack power and voice to access basic services, identify opportunities, and exercise legal rights. Information is scarce. Household, village, and local government decision-making processes are often opaque and exclusionary. Mechanisms to ensure accountability in delivery of state and local government services are weak. The Project's facilitators working with the Fadama groups will help them overcome barriers deriving from lack of knowledge or insufficient cooperation among groups.
- (iv) To promote socially-inclusive and community-based approaches: Integration of social inclusion and community-driven principles has proven to be cost-effective, responsive to local priorities and effective in reducing conflicts over use of natural resources. This proven approach has demonstrated that the key is to promote investments that bring both private profitability and public benefits.
- (v) To accord adequate attention to technical quality assurance: Limited

capacity in supervising the technical aspects of community subprojects contributed to delay in implementing local development plans and subprojects funded under the Fadama II Project. The Fadama development facilitators and service providers will receive adequate training before they are deployed in the communities. The Facilitators' training program will be designed to increase their sector-specific technical skills and provide them with the skills to perform feasibility work and technical supervision with the participation of the farmer groups. The Agricultural Development Program (ADP) offices will train the service providers (NFDP, 2018).

The FADAMA III Project coverage was national. It included the 19 states that did not benefit from the ongoing IDA Fadama II Project and the Fadama II states that meet the eligibility criteria for continued participation that include: (i) satisfactory disbursement performance as indicated by at least 75 percent of the IDA credit disbursed by appraisal of the proposed Fadama III Project; (ii) demonstrated pro-poor impact from the resources disbursed directly through community subprojects (as indicated by impact evaluation and beneficiary assessment studies, including the mid-term review (MTR) of Fadama II Project); (iii) establishment and funding of the operations of the core teams of the State Fadama Coordination Offices (SFCOs) and (iii) commitment to the Project as demonstrated by payment of counterpart contributions towards the costs of the project preparation work and implementation (Bature et al 2013).

The Project covers up to 20 Local Government Authorities (LGAs) for the 19 states that did not benefit from the Fadama II operation. In the Fadama II states, up to four LGAs were added to the ten LGAs that have already benefited. The GEF support focussed especially but not exclusively on the states of Borno, CrossRiver, and Osun, selected by the Government's newly founded National SLM Committee for their ecological and geographic diversity. The beneficiaries were assisted to organize themselves in economic interest groups, named Fadama

User Groups (FUGs), each having on average around 20 members (plus these individuals' households). The FUGs establish Fadama Community Associations (FCAs), which are apex organizations of 15 FUGs on average at the community level (Bature et al 2013).

Impediments to the Effectiveness of Public Policies Towards Rural Development in Nigeria

The common setbacks or bottlenecks limiting the effectiveness of rural and agricultural development policies in Nigeria include:

1. Ineffective Implementation of Rural Development Policies, Project and Programming.

As stated earlier in this paper, Nigeria has over the years nonetheless developed some policies to enhance rural substantially; reaching the development objectives of those policies and programs is bordered around the pattern and nature of their implementation which has been characterized by ineffectiveness and inefficiency.

Ikelegbe (2006) argued that ineffective policy implementation is usually very difficult to realize particularly in developing nations like Nigeria. The inability of the relevant rural development agencies to effectively implement rural development policies could be as a result of inadequate resources, which quite often is a real threat to successful implementation of rural development policies. It could as well be as result of the pervasive corruption in the Nigeria public service bureaucracy. Such corrupt tendencies most often, significantly increases the possibility that allocated fund for rural development projects and programs may be misappropriated or embezzled and thus hampering effective implementation and the consequent realization of policy development and objectives.

For example, the Agricultural Development Fund (ADF) that was intended to raise agricultural products and improve conditions of the rural population, the Directs rate of food, Roads and Rural Infrastructure intended to transform the rural infrastructure were unable to meet their development objectives due largely

to poor implementation (Ajadi, 2010). Indeed, the rural development strategies do not work in a vacuum. Their effective implementation requires functional and capable institutions with appropriate institutional arrangement for their effective implementation.

Another major explanation for the ineffective implementation of rural development policies in Nigeria is the high level of policy instability characterized by frequent reversal of policy associated with governance result in serious distortion in full implementation and actualization of policy goals and objectives (Inedu 2016). Most often, rural development policies or programs are discontinued whenever there is a change in government leadership. Usually, new government abandons the projects and programs of its predecessor even when such policy is appropriate. Thus, Ajadi (2010) notes that there is usually the absence of sustained cohesive and conclusive implementation of rural development policies. It is this propensity that led to the abandonment of better life for rural women of General Ibrahim Bagangida to the introduction of the family support programme by the succeeding regime of General Sani Abacha. In the context of this most rural development policies are not implemented to their logical conclusion (Chukwuemeka et al 2013).

For Malon (1992), there is a gross rural neglect in Nigeria's development policies which has resulted to rural underdevelopment as reflected in the lack of rural industrialization and poor physical, social and institutional infrastructures. This prevalent orientation is closely connected with the colonial economy which is still promoted in Nigeria. Olarenwaju and Falola (1992) also noted that such development strategy of concentrating investments in urban areas has resulted to a wide imbalance or gap in rural and urban development. This factor of relative neglect for rural development was reinforced by government's over-reliance on the petroleum economy.

Obviously, the petroleum economy has become the main stay of the country's economy and for which government has, over the years, paid less attention to the

development of the major activities of the rural areas particularly agriculture. Agriculture has continued to dwindle more as it loses its economic importance following the greater emphasis on the petroleum sector. In essence, the emphasis on petroleum economy and the subsequent neglect of the agricultural sector has contributed substantially to the current poor state of the rural economy and the general rural sector underdevelopment.

2. Lack of Integration of The Various Rural Development Efforts

There is a lack of cooperation among rural development institutions to ensure that their respective initiatives, actions and mandates are coordinated to reinforce and support each other and that their activities are streamlined towards effective realization of government's rural development objectives. Idowu (1999:181) observes this impediment to rural development in Nigeria in his comment thus:

The activities of various bodies involved in the development efforts and activities never dovetailed as expected. This is to say that the expected co-ordination among the different departments, ministries, Federal, states and the local governments for instance, on the implementation mechanisms has been very difficult to achieve.

Rural development efforts in Nigeria have not been given the integrated and comprehensive approach it requires. This has been a challenge to rural development and rural development in order to be effective has to be comprehensive, involving all aspects of rural life and involving the complimentary efforts of the local government, state government and federal government as well as the communities and voluntary agencies. Integration is indeed, necessary as the factors involved in rural development are interrelated and mutually enhance one another in their effectiveness (Okoli and Onah, 2002).

3. Poor Commitment of the Political Representative, Towards Enhancing Rural Development

The political leaders in Nigeria, either at the executive or the legislature arm, have all come from given rural areas of the country. These politicians at different

points and time, have observed the development needs of these rural areas and made promises too on how to address these development concerns of the respective rural areas of origin. However, their will and interest to actually articulate those problems and the strategies or programs for addressing them have, indeed, not been noticeable.

The prevalent and common observation is that they, hardly pursue conclusively the link to the development needs of rural parts of their constituency. This lack of interest and political will to project the development needs of the rural areas at the relevant political and bureaucratic power points does not induce government's prompt attention to the development needs of the rural areas (Chukwuemeka et al 2013). This is again reinforced by the fact that most political office holders (local government councillors and Supervisors, state commission and chairman of local government areas, state legislatures and federal legislature all detest living in the rural areas and have opted to ranker. Live in the metropolitan state capital or federal capital territory, Abuja. For this, they do not feel the impact of the gross deprivation obtainable in the rural areas and for which they tend not to realize the urgent and shire need for enhancing development in the rural areas (Chukwuemeka et al 2013).

These attitudes do not reflect effective political representation particularly for the rural population. Indeed, as Baba (2011) noted, political representation in Nigeria is essentially for private benefit and not for public benefit. This reasonably explains the nonchalant attitude by political leaders and representatives towards enhancing national development generally and that of their respective rural constituencies particularly.

4. The Inefficiency of the Local Government Areas

The local government areas occupy a strategic position in the development process of the rural areas. Even though it cannot be reasonably assumed that other higher tiers of government (state and federal tiers) do not have a role to play in enhancing rural sector development, the task constitutionally centres, in a larger part, on the local government. The primary

purpose of local government is to provide essential local services and thus accelerate the pace of social and economic development of the rural and grassroots people.

Indeed, the reconstitution of Nigeria into 301, 589 and 774 local government areas in 1976, 1991 and 1996 respectively was meant ostensibly to bring government closer to the local people and to speed up rural development. Sad enough, this objective has not been noticeably realized (Tonye, 1995; Baba, 2011). This is even so, despite the huge monthly statutory allocations to the local government areas. The inability of the local governments to work towards enhancing the rural development could, in large parts, be attributed to poor and inept leadership and pervasive corruption in the local government administrative system (Halidu, 2012; Anikeze, 2012).

The high level of corruption, for instance, makes it difficult for them to channel adequate fund and energy to effective rural development. As Anikeze (2012) noted that the interest of local government leadership primarily revolves around trivialities or at best around those schemes for which they hope to derive immediate personal gains. The net effect of this has been general stagnation in the development process of the rural people and their environment.

Conclusion

The rural areas of Nigeria are largely characterized by lack of basic infrastructure facilities and general underdevelopment enhancing the rural development status is a prerequisite for sustainable national development. The various policy measures are developed to enhance development in the rural areas by successive governments in Nigeria have not translated with visible and meaningful

transportation of the rural sector. One of these public policies on rural development is the Fadama III programme.

In conclusion, the Third National Fadama Development Project has progressively impacted rural development in Nigeria which needed to be consolidated in the subsequent phases ahead. The project has impacted positively on the following areas; input support, assets base of participants, impacted on participant's yield output and economic status of participants. However, the project performed minimally in terms of overall development of rural areas and this calls for tremendous need to sustain the programme so as to maximise the gains that are derivable from its lofty objectives. In the end, this paper recommended that:

- Federal Government needs to sustain the FADAMA programme in phases as it has been to support food production and sustain food security in Nigeria. And also to make rural development the top of the agenda of the national development in realization of the fact that enhanced rural development is a prerequisite for meaningful and sustainable overall national development.

- Furthermore, there is need for consistency in the execution of rural development programmes. Indeed, sustenance of appropriate rural development programs such as FADAMA should continue irrespective of changes in government.

- Since FADAMA program is a policy towards agricultural revolution and drive towards economic diversification from total dependence on oil, an overhaul of the institutional and legal framework for the design and implementation of subsequent phase of FADAMA program should be considered a utmost priority by the current administration.

- Lastly, the framework for implementation should centre on registered Farmers cooperatives.

Publication Date: 2025/11/28

Abstract

Infrastructure is vital to Nigeria's economic transformation; however, ongoing deficiencies in transport, housing, energy, water, and telecommunications hinder growth and fairness. Public-Private Partnerships (PPPs) have surfaced as a strategic solution, harnessing private funding, knowledge, and creativity to enhance constrained public resources. This research rigorously evaluates the success of PPPs in delivering national infrastructure, using Lagos State as a primary example. Utilizing documentary analysis, secondary data, and theoretical frameworks like cross-sector partnership theory, resource dependence, and principal-agent theory, the study assesses governance frameworks, risk-sharing strategies, and socio-economic impacts. Results show that although PPPs in Lagos have hastened project completion and enhanced service quality in areas like transportation and urban development, difficulties remain. Limited institutional capability, inconsistent policies, and uneven access to information hinder both accountability and efficiency. Housing projects frequently encounter challenges related to affordability, whereas energy and water initiatives experience shortcomings in sustainability and inclusivity. The study emphasizes that adaptive governance, fair risk distribution, and participatory involvement are essential for aligning private interests with public good. The research finds that PPPs have the power to transform Lagos, but they need enhanced governance structures, creative funding methods, and the incorporation of climate resilience along with social inclusivity. By placing Lagos in the context of Nigeria's overall PPP environment, the research provides localized perspectives on global discussions regarding infrastructure governance in developing countries and suggests policy recommendations for attaining more sustainable and fair results.

Keywords: Public-Private Partnerships (PPPs), Infrastructure Development, Inclusive Development, Sustainability, Lagos State, Nigeria

Introduction

Infrastructure is vital for Nigeria's economic advancement and societal health, yet persistent deficits in transportation, electricity, water, and telecommunications impede progress and worsen disparities (Jibrin, Abdulkareem & Lawan, 2018). Financial limitations, weak institutions, and inadequate project management have exposed the flaws of traditional government-led methods, prompting a shift towards Public-Private Partnerships (PPPs) as alternative approaches to delivery (Obasa & Oluyomi, 2024). PPPs seek to harness private investment and expertise, sharing risks and rewards with the government to improve efficiency, cost-effectiveness, and service quality. Information from Lagos State indicates that road initiatives managed by PPP were finished more

rapidly and received higher levels of public approval compared to conventional projects (Ahmadu, 2024). Similarly, studies highlight political support, risk sharing, and economic viability as crucial factors for the successful implementation of PPP infrastructure in Nigeria (Babatunde & Perera, 2017). Despite this potential, the outcomes of PPP remain inconsistent. The Infrastructure Concession Regulatory Commission identifies common deficiencies—poor feasibility studies, inadequate legal frameworks, weak contract enforcement, and political interference (ICRC, n.d.). Empirical research likewise reveals stakeholder doubt, competing motivations, and limited governmental capacity for managing and supervising projects (Dada, Ogunlana & Anakor, 2024). Broader examinations link poor

performance to inconsistent policies, corruption, and inadequate regulatory frameworks (Jibrin et al., 2018). The limitations are evident across different industries. Partnerships for housing have encountered difficulties in delivering affordable units due to lack of adequate institutional support (Ibem, Adeboye & Alagbe, 2014). In transportation, despite some advancements, issues such as funding shortfalls, insufficient maintenance, and lack of accountability persist (Edogbanya & Adekeye, 2024). These discrepancies highlight the absence of unified frameworks to link PPP practices with developmental goals. Equally pressing is the neglect of social worth. PPPs often focus on profit rather than inclusivity, sustainability, and equitable access. Studies emphasize that accountability, transparency, and citizen-centered governance are vital for public-private partnerships to advance the Sustainable Development Goals in Nigeria (Obasa & Oluyomi, 2024).

Objective of the Study

The core objective of this study is to critically examine the role and effectiveness of Public-Private Partnerships (PPPs) in national infrastructure development in Nigeria, with emphasis on performance outcomes, governance frameworks, and sustainability implications.

The specific objectives are to;

- i. evaluate the performance, governance structures, and risk-sharing mechanisms of PPPs in Nigeria's infrastructure sector.
- ii. To assess the socio-economic and technological impacts of PPP-driven infrastructure projects, and propose policy recommendations for enhancing their effectiveness and sustainability.

Research Questions

The following research questions are germane to the study:

3. To what extent do PPPs enhance efficiency, governance quality, and risk allocation in Nigeria's infrastructure development?
4. What measurable socio-economic, technological, and sustainability outcomes are generated by PPP-driven infrastructure projects in Nigeria?

Scope and Limitations

This research explores Public-Private Partnerships (PPPs) in Lagos State from 2020 onwards, focusing on transportation, energy, water, housing, and telecommunications. Lagos is chosen as it serves as Nigeria's economic center, featuring the widest variety of PPP initiatives, and is backed by a committed policy structure. The emphasis is on formal PPPs evaluated via qualitative case studies and secondary data to understand how the government utilizes private investment for infrastructure provision.

The study is limited by insufficient reliable data, intricate contracts, and a lack of transparency, all of which hinder performance evaluation. Dependence on case studies limits generalizability, and the rapid advancement of technology indicates that upcoming trends may not be completely addressed. Wider economic and political factors also influence results but are not the primary focus of the study. Nonetheless, Lagos presents a distinct perspective: its scale, assets, and innovative PPP policies position it as a strategic example for comprehending sub-national infrastructure management in developing situations

Literature Review

Conceptual Foundations of PPPs in Nigeria

Public-Private Partnerships (PPPs) have developed as strategic methods for tackling Nigeria's infrastructure shortcomings by combining public and private resources. They are more frequently seen as cooperative governance frameworks that utilize private investment and knowledge to enhance restricted public finances (Akinkunle & Ajayi, 2015; Nwangwu, 2017).

Institutional and Regulatory Landscape

The framework for PPPs in Nigeria is based on the Infrastructure Concession Regulatory Commission (ICRC) Act of 2005, which offers legal support for concessions and project supervision. Even with these frameworks, inadequate regulatory enforcement and political meddling persist in compromising PPP results (Ogunlana, 2010; Odigbo, 2015). Enhancing institutional capacity and regulatory autonomy is key to boosting the effectiveness of PPPs.

Performance, Risk, and Infrastructure Delivery

PPPs have shown the ability to lower project expenses, enhance service quality, and effectively shift risks. Nonetheless, issues like inadequate project implementation and unbalanced risk distribution frequently endure (Edogbanya & Adekeye, 2024; Okoye & Chukwuemeka, 2012). Tackling these problems necessitates more explicit contractual frameworks and open procurement procedures.

Socio-Economic Impacts and Local Relevance

The socio-economic effects of PPP projects go further than just infrastructure provision. Research indicates that they can create jobs, promote regional integration, and alleviate poverty, yet success frequently depends on governance abilities at both state and federal levels (Akinwale, 2014; Onwuekwue, 2015). Engaging all stakeholders inclusively is crucial to guarantee fair advantages.

Governance, Ethics, and Public Trust

Integrity in governance and ethical responsibility are essential for maintaining the legitimacy of PPPs in Nigeria. Studies indicate that leadership, responsibility, and ethical behavior significantly affect public sector efficiency and, consequently, the results of PPP (Mukoro & Okereka, 2023; Erude, 2024). Thus, guaranteeing transparency in procurement and oversight processes is vital for tackling public doubt and enhancing confidence in PPP agreements.

Technological Integration and Innovation

Recent PPP efforts are progressively utilizing digital platforms to enhance oversight, transparency, and effectiveness. Despite inconsistent integration of ICT and data systems, digital innovations present chances to enhance accountability and operational efficiency (Ojo, 2016; Udeh, 2020). Therefore, increasing the adoption of technology is essential for updating PPP frameworks in Nigeria.

Overview of Public-Private Partnerships (PPPs)

Public-Private Partnerships (PPPs) are vital for addressing Nigeria's infrastructure gap by utilizing private investment, expertise, and creative solutions (Babatunde, Opawole, & Akinsiku, 2012). Through frameworks like Build-Operate-Transfer (BOT) and concessions, these agreements are especially pertinent in managing Nigeria's evolving political and regulatory environment (Babatunde et al., 2012). Efficient PPPs can improve effectiveness, speed up project completion, and offer performance rewards—mitigating enduring inefficiencies found in the public sector (Babatunde et al., 2012). Nevertheless, difficulties emerge from misaligned motivations, governance flaws, and institutional deficiencies (Babatunde, Perera, Zhou, & Udejaja, 2015). Enhancing regulatory bodies like the Infrastructure Concession Regulatory Commission (ICRC) and maintaining transparency are crucial for the sustainability of projects (Babatunde, Ekundayo, Udejaja, & Abubakar, 2020). Erude (2024) emphasizes that Nigeria's public enterprises suffer from systemic flaws—characterized by governance issues and inefficiency—which have hindered infrastructure development, thus highlighting the need for PPPs as a different governance and funding approach.

Historical Context of Infrastructure Development in Nigeria

After gaining independence, Nigeria depended significantly on government-driven infrastructure projects. Despite aspirations, public projects faced financial restrictions, bureaucratic delays, and governance challenges, resulting in ongoing underachievement (Babatunde et al., 2015). The

early 2000s brought about reforms and sector liberalizations that formalized the adoption of PPPs, including the creation of the ICRC under the National PPP Policy (ICRC, 2022). In spite of these reforms, the execution of PPP remains hindered by structural issues, particularly in risk distribution where public partners frequently carry unequal loads, and in policy inconsistency (Babatunde et al., 2015).

Successful initiatives, however, are those that align with national development goals and address local requirements (Babatunde et al., 2012; Babatunde et al., 2020). Mukoro (2024) emphasizes that without inclusive governance and awareness of Nigeria's socio-political contexts, especially in marginalized areas like the Niger Delta, infrastructure initiatives—including PPPs—are likely to lose their legitimacy and long-term viability.

Models and Types of PPPs

Public-Private Partnerships (PPPs) utilize various contractual and operational frameworks that allocate risks, duties, and advantages between the government and private entities. In Nigeria, these frameworks have been utilized in transportation, energy, and social infrastructure initiatives to close financing deficiencies and enhance service provision (Akintoye & Beck, 2009; Nwangwu, 2018). Choosing a type of PPP is influenced by project size, industry requirements, governance structures, and socio-political circumstances. An examination of essential models—including service contracts and intricate concession and finance-oriented agreements—provides insights into their flexibility and obstacles in Nigeria's infrastructure development environment.

Build-Operate-Transfer (BOT)

The BOT model enables private entities to fund, build, and manage infrastructure before returning ownership to the government. In Nigeria, it has been extensively utilized in road concessions, electricity production, and port facilities (Onwuekwe, 2014; Kiri & Adebayo, 2021). BOT draws in private investment and technology, simultaneously lightening the immediate financial load on the government. Nonetheless, obstacles comprise inconsistent regulations, ineffective dispute resolution, and political meddling. Successful stakeholder involvement and defined legal structures are essential to maintain BOT results and guarantee value-for-money in Nigeria's infrastructure development.

Design-Build-Finance-Operate (DBFO)

DBFO combines design, construction, financing, and operations into a single contractual agreement, shifting considerable risks to private partners while promoting efficiency throughout the project's lifecycle. Nigerian implementations in transport

pathways and energy initiatives demonstrate its capacity for enhanced delivery and maintenance quality (Nwangwu, 2018; Osei-Kyei & Chan, 2017). The model encourages innovation and alleviates public funding strains, but encounters challenges related to institutional capacity shortfalls and lengthy contract discussions. Success relies on clear governance, robust regulatory oversight, and fostering local capabilities to reduce the risks of foreign control and guarantee equitable advantages.

Concession Agreements

Concessions provide private companies the authority to manage and operate public properties for a set duration, recovering investments via user fees or charges. They have played a significant role in Nigeria's airports, ports, and roadways (Ikejiofor, 2016; Okoye & Chiejina, 2019). Concessions improve operational efficiency and upkeep while raising worries about the affordability of tariffs and public responsibility. Incorporating performance benchmarks and impartial oversight is crucial to reconcile profitability with public interest.

Joint Ventures and Service Contracts

Joint ventures integrate public and private equity in co-owned organizations, distributing risks and promoting knowledge exchange, though they require robust governance to avoid conflicts (Eboh, 2013). Service contracts, conversely, are temporary arrangements where private companies provide defined services under governmental oversight—beneficial in areas such as water provision and waste disposal. Although simpler, their effect is confined to operational enhancements without long-term financing leverage. Generally, PPP models in Nigeria range from simple service agreements to capital-heavy BOT, DBFO, and concession arrangements. Their achievements are influenced not just by funding and risk-sharing methods but also by the quality of governance, involvement of stakeholders, and the capacity of institutions (Nwangwu, 2018; Onwuekwe, 2014). For Nigeria, customizing models to align with local socio-political and economic conditions is crucial for optimizing infrastructure results and long-term viability.

Table 1
Comparative Overview of PPP Models in Nigeria

PPP Model	Core Features	Nigerian Applications	Key Challenges
BOT	Private partner finances, builds, operates, then transfers asset back to government.	Lekki-Epe Expressway; Independent Power Projects.	Regulatory uncertainty, political interference.
DBFO	Single contract covering design, construction, financing, and operation.	Road corridor projects; Independent energy plants.	Capacity gaps, dominance of foreign investors.
Concessions	Private operator manages public asset for fixed period, recoups via tariffs.	Port reforms (Apapa & Tin Can).	Tariff affordability, weak accountability.
Joint Ventures	Shared ownership between public and private partners.	Oil & gas sector; state infrastructure.	Governance conflicts, low transparency.
Service Contracts	Short-term private provision of defined services.	Water supply contracts; Waste management.	Limited scope, no financing leverage.

Note. Table developed by the author based on literature review (see Akintoye & Beck, 2009; Nwangwu, 2018; Onwuekwe, 2014; Ikejiofor, 2016).

Challenges and Opportunities of PPPs in Nigeria

Public–Private Partnerships (PPPs) in Nigeria are extensively advocated as a remedy for persistent infrastructure shortfalls. However, considerable governance shortcomings—like disjointed institutional frameworks, unclear regulatory processes, and fragile accountability systems—persist in eroding investor trust and the enforceability of contracts. For example, Erumebor (2017) highlights that failures in the execution of PPPs usually arise from strategic misalignment,

lack of transparency, and unclear regulatory frameworks. Additionally, systemic issues in public sector ethics and organizational conduct, highlighted in research on public service performance in Delta and Rivers States, emphasize the vital importance of institutional culture in influencing PPP outcomes (Okereka & Mukoro, 2023; Nwachuku, Okereka & Mukoro, 2023). However, PPPs offer encouraging opportunities for infrastructure advancement when governance and stakeholder involvement are enhanced. Collaboration among multiple stakeholders—uniting government bodies, private entities, and communities—can improve transparency, foster innovation, and promote shared ownership. Comparable dynamics manifest in organizational

settings: Okereka, Mukoro, and associates emphasize the impact of genuine stakeholder engagement and ethical practices in public organizations. Incorporating participatory and ethical standards into PPP frameworks can enhance project credibility and ensure infrastructure delivery aligns with wider development objectives. Achieving these benefits depends on institutional changes: strong legal systems, defined regulatory supervision, open monitoring, and ongoing dialogue among all parties involved. Using these foundations, PPPs in Nigeria have the potential to transform from challenging trials into successful, inclusive, and sustainable drivers of infrastructure-driven development.

Theoretical Perspectives

The dynamics of Public-Private Partnerships (PPPs) in Nigeria can be analyzed through various theoretical perspectives. Cross-sector partnership theory emphasizes the necessity of cooperation between public and private entities to accomplish common objectives. Van Tulder et al. (2015) contend that achievement relies on the quality of governance, trust, and the management of power imbalances, while Pattberg and Widerberg (2015) emphasize the importance of accountability and inclusivity. In Nigeria, these viewpoints indicate that inadequate institutions and a lack of transparency obstruct legitimacy and alignment among stakeholders. Resource dependency and institutional theories offer structural perspectives. Resource dependency perceives partnerships as tactics to obtain limited resources like funding and knowledge (Sadovnikova & Pujari, 2017). In Nigeria, the government relies on private investment, whereas investors depend on governmental legitimacy, thus making equal risk distribution crucial. Institutional theory highlights the impact of regulations and standards in influencing results (Van Tulder et al., 2015). Ongoing policy inconsistency, corruption, and gaps in contract enforcement highlight the need for institutional reform to facilitate sustainable PPPs. Relational and typological viewpoints provide additional insight. Social capital theory highlights the importance of trust and networks in facilitating cooperation (Pattberg & Widerberg, 2015), an essential element in Nigeria, where widespread public distrust frequently hinders projects. Partnership classifications, as described by Valli et al. (2016) and Bovill and Felten (2016), indicate that participatory and co-creative frameworks are more robust than solely contractual arrangements. In Nigeria, this implies that PPPs will be most successful when institutional capacity, inclusive participation, and trust cultivation come together to provide infrastructure that aligns with development objectives.

Principal-Agent Theory

The principal-agent theory illustrates the dynamics of delegation and control in Public-Private Partnerships (PPPs), in which the government assigns private companies the tasks of designing, financing, and delivering infrastructure. In Nigeria, this connection is frequently hampered by information imbalances, inadequate regulatory supervision, and differing goals. Private partners might leverage their advanced knowledge to distort costs or benefits, whereas governmental bodies find it challenging to ensure accountability. Such discrepancies often result in budget excesses, inadequate service provision, or disregard for social priorities, rendering the synchronization of incentives and risk-sharing crucial for successful results (Kolk & Lenfant, 2015).

Addressing these challenges necessitates more than just formal agreements; it requires flexible governance and comprehensive oversight. Enhancing state capacity, promoting transparency, and involving communities in oversight can reduce opportunism and enhance accountability. Data from partnerships in other contexts indicates that when risks are equitably distributed and performance is closely tracked, both trust and efficiency enhance, leading to a stronger alignment between the motivations for private profit and the objectives of public welfare (Sewankambo et al., 2015). Hence, the principal-agent perspective highlights that sustainable PPPs in Nigeria rely on enhancing institutions and governance systems that protect public interests while utilizing private sector knowledge.

Research Methods

This research utilizes a qualitative design grounded in secondary data to analyze Public-Private Partnerships (PPPs) in the development of infrastructure in Nigeria. Analyzing documents related to government policies, project reports, contracts, and regulatory frameworks offers understanding of governance frameworks, risk distribution, and institutional interactions (Lowndes & Skelcher, 1998; Grimsey & Lewis, 2002). Additional evidence is sourced from existing studies, global reports, and historical records to reflect long-term trends and contextual changes (Holloway & Parmigiani, 2014). This method enables a thorough evaluation of PPP effectiveness and sustainability without the constraints of limited field access. To improve reliability, the research employs triangulation, contrasting official documents with academic literature and independent assessments to confirm results (Fiore, 2001; Epstein, 2009). The analytical focus is on risk management, governance structures, and the socio-political aspects of PPPs, guided by recognized partnership theories (Brinkerhoff & Brinkerhoff, 2011). The design is

investigative and interpretive, intended to generate subtle insights that enhance academic discourse and guide policy regarding the efficiency, obstacles, and sustainability of PPPs in Nigeria's infrastructure domain.

Data Analysis

Overview of PPP Projects in Lagos State

Lagos State, Nigeria's financial hub, faces persistent infrastructure deficiencies driven by swift population increase, urban development, and budget constraints. Public-Private Partnerships (PPPs) have thus emerged as a vital approach to attract private funding for important initiatives in transportation, energy, housing, and urban development. The state is frequently referred to as Nigeria's experimental site for PPPs, featuring significant projects like the Lekki-Epe Expressway, Lekki Deep Seaport, Eko Atlantic City, the Bus Rapid Transit (BRT) system, and the Lagos Rail Mass Transit. Research indicates that PPPs in Lagos have improved service delivery and encouraged investment, although their overall impact has been diminished by governance, financing, and institutional capacity issues (Babatunde, Opawole & Akinsiku, 2012; Anigbogu et al., 2021).

Sectoral Experiences

Transport Infrastructure

The Lekki-Epe Expressway stands as Lagos's premier PPP project. The concession model drew initial investment interest but subsequently encountered challenges due to public opposition to tolls, inadequate risk-sharing agreements, and minimal government backing, which ultimately led to the state's repurchase of the project (Nwangwu, 2019; Ojo, 2014). In spite of these limitations, PPPs have enhanced traffic movement, decreased travel durations, and generated job opportunities (Ahmadu, 2024). Likewise, the Lekki-Ikoyi Link Bridge and the BRT system illustrate how PPPs can enhance urban mobility and alleviate congestion (Adeyemi, Adenusi & Osunsanmi, 2015).

Ports and Trade Logistics

The Lekki Deep Seaport and the nearby Free Trade Zone demonstrate the strategic application of PPPs to enhance Lagos's regional trade competitiveness. Intended to alleviate congestion at Apapa Port and draw foreign investment, these initiatives have been praised for their economic potential, yet worries persist regarding their long-term environmental and social sustainability (Edogbanya & Adekeye, 2024).

Urban Development and Housing

Notable initiatives like Eko Atlantic City highlight Lagos's goal to establish itself as a worldwide

investment hub. Nonetheless, academics warn that these initiatives frequently exacerbate social disparity by favoring upscale residences and business areas while overlooking the requirement for affordable housing. Advocacy for more inclusive PPP housing strategies has highlighted the importance of affordability, transparency, and social equity (Ibem, 2011; Sule, Esidene & Adadu, 2024).

Major Constraints

Despite being a leader in PPP adoption, Lagos still faces persistent challenges:

4. Unbalanced risk allocation and weak financial structuring, particularly evident in the Lekki-Epe Expressway (Nwangwu, 2019).
5. Minimal stakeholder engagement, with citizen participation often limited or symbolic (Ashade, 2020).
6. Transparency and governance deficits, which discourage investor confidence and weaken public trust (Anigbogu et al., 2021).
7. Socio-economic exclusion, where infrastructure largely serves higher-income groups at the expense of broader societal needs (Ibem, 2011).

Strategic Directions

For PPPs in Lagos to achieve transformative impact, scholars propose several measures:

- g) Strengthening community participation to improve legitimacy and ensure projects reflect local needs (Ashade, 2020).
- h) Enhancing procurement transparency and equitable risk-sharing to avoid failures experienced in past concessions (Nwangwu, 2019).
- i) Adopting innovative financing tools such as blended finance, green bonds, and impact investments to sustain long-term infrastructure delivery (Alamu et al., 2024).
- j) Mainstreaming resilience and climate adaptation metrics, given Lagos's exposure to flooding and coastal risks.
- k) Reorienting PPP housing projects toward inclusivity, with frameworks that address the needs of middle- and low-income groups (Ibem, 2011).

Conclusion

The Lagos PPP experience highlights the potential and challenges of private sector partnership in infrastructure provision. Significant advancements have been achieved in transport, maritime commerce, and urban growth; however, challenges related to governance, risk distribution, and inclusivity persist in threatening long-term sustainability. A transition to more transparent, robust, and socially inclusive PPP frameworks—based on innovative funding and climate-conscious

planning—will be crucial for Lagos to completely harness the developmental advantages of PPPs.

Recommendations

After a critical analysis we recommend that the government, private sectors and relevant stakeholders should;

15. Strengthen PPP governance with transparent, inclusive, and accountable frameworks.
16. Diversify financing through green bonds, blended finance, and climate-responsive investment tools.

Quantum Marketing Strategies and Marketing Performance of Real Estate Companies in Edo and Delta States, Nigeria

OSOSUAKPOR, Joy

Department of Petroleum Marketing and Business Studies,
Petroleum Training Institute,
Delta State, Nigeria.

Publication Date: 2025/11/28

Abstract

This study examines the effect of quantum marketing strategies and marketing performance of real estate businesses in Edo and Delta States, Nigeria. Specifically, the study sheds light on how hyper-personalization and cross-channel integration influence the level of marketing performance of the Nigerian real estate industry. A survey research design was used and a sample of three hundred and sixty-one (361) respondents who are employees of selected real estate business in Edo and Delta States were obtained. Data obtained in the survey were analyzed via descriptive (mean, standard deviation, Pearson correlation and variance inflation factor) and inferential (multiple regression models) statistical tools. Remarkably, the results revealed that these emerging strategies (hyper-personalization and cross-channel integration) have statistically significant and positive effect on marketing performance, particularly in areas of increased customer base, acquisition, retention, sales growth brand loyalty and brand visibility of real estate products/services. The implication of the finding is that while hyper-personalization enhances customers' loyalty by delivering timely property solutions, cross-channel integration ensures a dependable engagement of customers across multiple platforms, resulting to broader market reach. On the basis of the findings, the study recommends that real estate businesses should increase investments in quantum marketing (AI-driven, big-data analytics and machine-learning tools) because it has the potential of increasing marketing performance. Also, the real estate industry must strive towards harmonizing their digital and conventional marketing platforms so as to ensure a seamless customer experiences as well as strengthening brand recognition across all customers' touch-points.

Keywords: Quantum marketing strategies; Cross-channel integration, Hyper-personification; Petroleum marketing; Marketing performance

JEL Classifications: M31; M39

Introduction

In practice, marketing has evolved over time, adjusting to shifts in society and technologies. At first, organizations concentrated on mass production and distribution, and marketing was product-centric. Relationship-based marketing, which prioritises consumer interaction and brand loyalty, replaced it over time (Bader & Bin, 2024). However, organizations began using automation and data analytics to enhance targeting and personalisation as the digital era dawned, especially in the areas of communication, interpersonal connections, marketing, advertising among others around the world. According to Kumar, Ramachandran, and Kumar (2023), the majority of individuals are now familiar with social media and its use to manage various parts of their lives, including their organizations' marketing strategies; this is where quantum marketing strategies lies.

Quantum marketing is a framework that employs disruptive and probabilistic principles of quantum computing in transforming how marketers understand/engage with their consumers, moving beyond conventional linear models to create highly-personalized, real-time as well as effective campaigns for their products (Amol, 2022). It seeks to analyze complex consumer behaviour behaviours to offer deep, nuanced insights, leading to more accurate predictions, advanced personalization, optimized campaigns, and ultimately, a more resilient and relevant marketing function in an unpredictable world (Naeem, Rana & Nasir, 2023). Thus, quantum marketing strategies (QMS) are the approaches used by marketers in understanding and engaging a dynamic complex consumer-base via an adaptable, real-time, personalized model and use of advanced technologies such as artificial intelligence (AI), machine learning, and quantum computing.

Furthermore, in order to maximise customer interactions and corporate performance, the most recent phase, known as quantum marketing, combines AI, machine learning, and other technologies in a complete way (Chaffey & Smith, 2022). With this strategy, marketers can use real-time and predictive analytics for targeted marketing campaigns, going beyond conventional segmentation. The development of websites and online platforms was spurred by the significance of online marketing to business operations across a range of industries, particularly the real estate sector. In the real estate sector, the usage of QMS is altering how information is disseminated and commerce is carried out by marketers. Hence, a new era in information processing and forward-thinking research is being heralded by rapidly evolving field of marketing analytics and emerging field of quantum marketing (Grewal, Roggeveen, & Nordfält, 2021).

Remarkably, the advent of contemporary logical tools and growing digitisation of consumer data have dominated the field of marketing analytics. Nigerian real estate professionals have a somewhat low awareness of online marketing for real estate disposal (Li, Wang & Ma, 2021). Real estate buyers can use easily accessible digital real estate information to inform their decisions thanks to the effectiveness and ease of digital marketing. Potential real estate buyers might avoid emotional pain throughout the decision-making process by properly communicating important information to them digitally (Li & Savitch, 2021). Therefore, using the right digital channels could help sway choices made in real estate purchases. In light of this, real estate professionals need digital skills via the use of quantum marketing to satisfy the demands of their clients in digital marketing.

The ability to learn and use digital technology-related knowledge, skills, and competencies – like Search Engine Optimisation (SEO), mobile apps, data analytics, the internet of things (IoT), AI, among others, to market real estate goods/services online is referred to as digital intelligence (Dibie, Anibueze & Eboh, 2022). Therefore, it is vital to adopt integrated digital intelligence competences (safety, rights, security, literacy and emotional intelligence) in order to maintain the future of digital real estate marketing. In the past, the real estate business has been infamous for embracing new technologies more slowly and often than other industries. However, a number of factors, including changing consumer preferences and the potential for improved performance, have recently caused a noticeable shift in the real estate industry's use of digital technology.

One indication of this shift may be the growing application of technologies like blockchain, virtual reality (VR), augmented reality (AR), AI, big-data, and the IoT at different phases of real estate lifecycle. Therefore, the use of digital technology for quantifiable communication (such web analytics)

while preserving and growing a strong relationship to keep existing real estate clients might be called real estate digital marketing (Ekwueme, Ezech & Olanrewaju, 2019). Real estate goods/services are positioned well via quantum marketing/digital marketing channels to facilitate easier consumer interaction, improve marketing performance as well as decision-making.

Large data sets can now be processed without any technical limitations via information and communication technology (ICT) for organizations. Organizations have tools like marketing automation that allow them to create personalised offers but a barrier to utilising technology's full marketing potential is the willingness of customers to grant an enterprise access to their data (Ullah & Sepasgozar, 2020). Thus, the primary obstacle to using technology's potential is gaining access to data and obtaining the customer's permission to collect, store, process, and make this data available. Arising from the above, this study investigates how quantum marketing strategies (QMS) (hyper-personification and cross-channel integration) affect the level of marketing performance of real estate companies in Edo and Delta States, Nigeria.

Review of Related Literature

Quantum Marketing Strategies (QMSs)

In recent times, quantum marketing strategies (QMS) has gained significant attention as businesses seek more advanced approaches to engaging consumers. Rahman et al (2023) describes QMSs as the next frontier in marketing evolution, driven by emerging technologies such as AI, blockchain, and neuro-marketing. Chaffey and Smith (2022) argued that digital marketing excellence is now dependent on the integration of machine learning algorithms, which enhance personalization and predictive analytics. This perspective aligns with the work of Grewal, Roggeveen, and Nordfält (2021), who highlight the role of AI in transforming retail marketing through personalized consumer interactions.

Mero, Tarkiainen and Tobon, (2020) emphasize the need for a balance between technological advancements and human-centric marketing strategies. Their research highlights that while automation and AI-driven analytics can optimize marketing performance, businesses must also address ethical concerns and consumer trust issues. Similarly, Ledro, Nosella and Vinelli (2022) explored the effect of augmented and virtual reality in marketing, arguing that these technologies create immersive brand experiences that significantly improve customer engagement. Blockchain technology is another critical aspect of QMS (Heimbach, Kostyra & Hinz, 2019). According to Heimbach, et al (2019), blockchain enhances data security, transparency, and trust in marketing transactions.

Kumar, Ramachandran and Kumar (2023) extend this analysis by examining how QMS and AI has

revolutionized marketing analytics, marketing performance, and decision-making processes. Overall, the literature indicates that QMS represents a transformative shift in how organizations interact with their consumers. QMS relies on several technological components to enhance consumer engagement and business performance. Augmented reality (AR) and virtual reality (VR) create immersive brand experiences, making marketing more interactive and engaging (Dwivedi et al., 2021). The IoT plays a crucial role by enabling real-time data collection and analysis, allowing businesses to offer personalized recommendations based on consumer interactions (Eboh, et al, 2022). These components collectively form a foundation of QMS, transforming traditional marketing approaches into data-driven and technology-enhanced strategies. QMS significantly influences marketing performance of real estate firms by enabling hyper-personalization, predictive analytics, and immersive consumer experience. The real estate industry thrives on trust, transparency and targeted communication, which QMS facilitates through AI-driven insights and blockchain technology. Thus, by leveraging AI-powered data analytics, real estate businesses can gain a deeper understanding of consumer preferences, enabling them to create personalized-marketing campaign that enhance customer engagement and conversion rates (Sundhara, et al, 2023).

Dimensions of Quantum Marketing Strategies

Hyper-Personalization

The way businesses interact with their customers has changed dramatically as a result of QMS. Hyper-personalization, which entails evaluating enormous volumes of data to customise marketing messages to specific customers, is one of its main advantages. Personalisation powered by AI improves consumer experiences and boosts brand loyalty (Grewal et al., 2021). By foreseeing customer demands and providing relevant content instantly, predictive analytics enhances engagement even further. Notably, personalisation has developed into hyper-personalization, a cutting-edge strategy that creates highly customised experiences for clients by leveraging data analytics, artificial intelligence, and machine learning (Rahman et al., 2023). By providing content and promotions that are specific to each customer's tastes, hyper-personalization fosters deep consumer engagement. Businesses can produce communications that are relevant and targeted by analysing client data, such as past purchases and online activity. Once more, knowing the preferences of each individual consumer helps companies to tailor goods and services to suit certain requirements and create a feeling of exclusivity (Liu, Zhang & Wang, 2021). Thus, by showcasing a thorough awareness of individual preferences and anticipating demands, hyper-personalization helps organisations to establish

emotional relationships. Customers become brand champions as a result of this loyalty, which transcends transactional encounters. Businesses can find pain points and remove friction in the customer journey by implementing hyper-personalization.

According to Markovich et al. (2019), consumers engage favourably with digital clienteling, which provides them with hyper-personalized product possibilities. Because it allows businesses to use real-time and AI-driven solutions, hyper-personalization can be thought of as a more detailed approach to personalisation. Organisations are using machine learning, artificial intelligence, the Internet of Things, and machine-to-machine communication to automate their marketing and personalise content in order to meet customer expectations and boost volume of real-time transactions (Mbali, Ngui & Ndiao, 2018). Hyper-personalization improves personalisation by utilising unstructured data, in contrast to standard personalisation, which is either predicated on a set of content guidelines or on watching consumer behaviour. The essence of hyper-personalization was summed up by Lahti, Wincent, and Parida (2018), who claimed that it shifts the way that customers communicate from using basic characteristics like name, location, or even segment to making sure that every component of a communication—including images, offers, products, and even the timing and manner of delivery—is tailored to the recipient.

Cross-Channel Integrations

Channel integration goes beyond conventional multichannel strategies in the context of quantum marketing by establishing a networked system in which real-time customer interactions are synchronised. Businesses may now deliver individualised and consistent messages across channels including social media, mobile apps, websites, and physical stores because to this integration (Bader & Bin, 2024). AI is essential to quantum marketing's channel integration optimisation; AI-driven analytics provide real-time synchronisation of consumer data across platforms, giving companies the ability to efficiently monitor customer interactions and preferences (Kumar et al., 2023). Businesses can create individualised marketing plans that appeal to certain customers by utilising this data.

Additionally, blockchain technology improves the transparency and security of transactions through linked channels. Blockchain technology can support safe and transparent real estate transactions in the context of real estate marketing, fostering buyer-seller confidence (Sundhara et al., 2023). By guaranteeing that all participants have access to unchangeable transaction data, this technology lowers the possibility of fraud and boosts process confidence. By gathering and evaluating data from numerous linked devices, the Internet of Things enhances channel integration even more. IoT devices

have the ability to track consumer interactions in real-world settings, including when they visit real estate showrooms, and combine this information with online activity. Marketers may provide individualised experiences that bridge the gap between online and offline channels thanks to this thorough understanding of client activity (Dwivedi et al., 2021).

Furthermore, to provide a smooth and customised consumer experience, channel integration in quantum marketing strategies makes use of cutting-edge technologies (Kumar et al., 2023). Businesses may improve customer engagement, establish trust, and cultivate enduring connections by coordinating data and interactions across several platforms. As technology advances, it is becoming more and more crucial for businesses looking to remain competitive in the digital market to incorporate AI, blockchain, and IoT into their marketing strategy.

Marketing Performance

Due to its subjective nature, performance has been interpreted in a variety of ways in the present. Numerous studies in the marketing literature examine how environmental factors relate to the concept of performance. According to Ledro et al. (2022), performance is defined as accomplishing the objectives specified in the convergence of enterprise orientations. In this sense, performance is not just the discovery of an outcome but rather the result of comparing the outcome with the purpose. A notable accomplishment in a field of endeavour, the best outcome obtained by a technological system, or a result (particularly good) obtained by an individual are all examples of performance (Dibie et al., 2022). Interestingly, performance can only be associated with one particular outcome; it cannot be associated with any other outcome. Performance is future-oriented, designed to reflect the distinctive qualities of each organisation or individual, and grounded in a causal model that links parts and products, claim Li and Savitch (2021). Performance is consequently influenced by a number of variables aimed at achieving the desired outcomes and meeting the demands of the clients. A more thorough definition of performance is provided by Markovich et al. (2010), who claim that it encompasses both acts and results. Both actions and results are regarded as performance; the results of the mental and physical labour required to complete tasks are not only tools for accomplishing certain goals, but are also outcomes in and of it that may be evaluated separately from results.

Enterprise performance, not just cost reduction or value enhancement, is what leads to a better cost-value pair, according to Rahman et al. (2023). Their competitiveness and success in the fast-paced corporate world of today are greatly influenced by their marketing performance. In order to increase brand awareness, draw in new clients, and boost sales,

businesses are putting more and more emphasis on marketing tactics (Ullah & Sepasgozar, 2020). Technology development, the regulatory environment, consumer behaviour, competition, and economic trends are some of the internal and external elements that influence marketing performance (Ullah & Sepasgozar, 2020). To keep ahead of the competition, businesses are constantly modifying their marketing plans to take these elements into account.

Growing competitiveness is one of the main issues that organisations are dealing with. Traditional corporate processes are threatened by new entrants' creative marketing strategies and digital solutions. Therefore, in order to effectively compete, businesses must use data analytics, AI-powered marketing tools, and performance-boosting tactics. Furthermore, according to Naeem et al. (2023), client involvement has emerged as a crucial component of marketing performance for businesses. In today's fiercely competitive industry, establishing trusting relationships with clients, learning about their needs, and providing individualised experiences are essential components of success. In order to improve their marketing success, businesses must spend money on client loyalty programs, social media involvement, and customer relationship management (CRM).

Theoretical Framework

The technological determinism (TTD) theory, which has drawn interest in the analysis of marketing research for real estate firms, served as the foundation for this investigation. According to TTD, the primary force behind societal transformation is technology. McLuhan and Postman have promoted the TTD, which holds that technological advancements have the ability to independently affect institutions, society, and human behaviour (Mero et al., 2020). TTD proponents contend that social and economic structures are changing mostly due to technology. Theorists emphasised that the characteristics of a communication medium have a fundamental influence on how information is interpreted and how society is formed by arguing that the medium is the message.

TTD offers a comprehensive perspective for examining the transformative impact of digitisation on the real estate industry. The theory provides a conceptual framework for examining the significant shifts in market dynamics, transaction procedures, and communication brought about by cutting-edge technological advancements. TTD clarifies how technology affects not just specific activities but also the broader socioeconomic structure of the real estate sector. This paradigm must be used to the quantum marketing of real estate operations in order to analyse how technology-driven changes impact various aspects of the real estate sector, including property listings, transactions, marketing, and consumer

behaviour. As a result, this paradigm observes shifts in market dynamics brought about by the direct effects of digitisation.

The deterministic nature of the theory itself has been cited as a significant critique of the TTD, which is not without its shortcomings and problems. According to Liu et al. (2021), it ignores the influence of socioeconomic and cultural factors on digital marketing, oversimplifying the intricate interaction between technology and society. Although digitalisation is a major factor in the real estate sector, it operates within a socioeconomic framework that is shaped by factors including governmental regulations, economic conditions, and cultural community preferences. Ignoring these factors could lead to an oversimplified view of the impact that technology has had on the real estate sector. TTD's relevance to QMS and marketing performance is essential because it frames the discussion of the transformative power of digital technologies and provides a framework for understanding how QTM alters the real estate industry's marketing performance.

Methodology

In this study, the descriptive survey approach was employed because it allows for description of the effects of quantum marketing strategies (QMS) on marketing performance of real estate businesses in Nigeria. The study population was made up of employees of ten (10) promising real estate businesses in Edo and Delta States, Nigeria. In this view of this, the population encompass top, middle

and operational levels of employees from the real estate businesses. The study population therefore results to four hundred and eighty-nine (489) employees of the real estate business in Edo and Delta States. A sample of three hundred and sixty-one (361) was obtained via the Krejcie and Morgan 1970 formula for sample size determination.

Furthermore, to accomplish the goals of the study, primary data (questionnaire) as the main instrument of data collection; this was administered to employees of the selected real estate businesses in Edo and Delta States. Likert 4-point scale - Strongly Agree, Agree, Disagree, and Agree was used for the survey question type. Cronbach alpha was employed to confirm the data's internal dependability; the Cronbach alpha obtained (hyper-personalization = 0.77; cross-channel integration -0.81; and marketing performance = 0.76) were above the Cronbach coefficient needed for a reliable instrument. Descriptive and inferential statistical tools were used to analyse data collected in the field survey; the following is the regression equation for the relationship between quantum marketing strategies (hyper- personalization and cross-channel integration) and marketing performance

$$\text{Marp} = F(\text{Hyper}, \text{Chanint})$$

eq. 1

$$\text{Marp}_i = a_0 + \beta_1 \text{Hyper} + \beta_2 \text{Chanint} + \mu_t$$

eq. 2

Where: Marp is marketing performance; Hyper is hyper- personalization; Chanint is cross channel integration; i is respondents μ is error term.

Results

Table 1: Summary of Descriptive Statistics Result

Parameters	Mean	Std. Dev.
Marketing Performance	3.1020	0.5042
Hyper-Personalization	2.9740	0.4130
Cross-Channel Integration	3.0411	0.5010
Observations	361	361

Source: Author's Computation (2025)

Table 1 shows the mean and standard deviation responses by the respondents on quantum marketing strategies variables (hyper-personalization and cross-channel integration) and marketing performance of the sampled real estate business in Edo and Delta States, Nigeria. The respondents' impression of quantum marketing strategies (QMS) (hyper-personalization and cross-channel integration) and marketing performance were found to be similar as

seen in the mean and standard deviation values (Table 1), with cross-channel integration having the greatest mean value (3.0411), indicating that respondents are informed, knowledgeable, and use quantum market strategies as a means of cross-channel integration of their real estate products/services.

Table 2: Pearson Correlation Result

Parameters	Marketing Performance	Hyper-Personalization	Cross-Channel Integration
Marketing Performance	1.0000		
Hyper-Personalization	0.0375	1.0000	
Cross-Channel Integration	0.2077	0.4210	1.0000
Observations	361	361	361

Source: Author's Computation (2025)

Table 2 shows the Pearson correlation result of the relationship between quantum marketing strategies variables (hyper-personalization and cross-channel integration) and marketing performance of the sampled real estate business in Edo and Delta States, Nigeria. The result revealed among others that there y.

Table 3: Variance Inflation Factor (VIF) Result

Parameters	VIF	1/VIF
Hyper-Personalization	1.02	0.9803
Cross-Channel Integration	1.01	0.9900
Mean VIF	1.05	

Source: Author's Computation (2025)

Table 3 is the multicollinearity result (VIF) for the quantum marketing strategies variables (hyper-personalization and cross-channel integration) and marketing performance of the sampled real estate business in Edo and Delta States, Nigeria. The VIF mean which is 1.05, is less than the accepted VIF mean of 10; this strongly suggests that there is

is a positive relationship between the quantum marketing strategies variables and marketing performance. More interestingly, the result revealed that there is the absence of multicollinearity between the pairs of the independent variables of the stud

absence of multicollinearity in the empirical model of the quantum marketing strategies variables(hyper-personalization and cross-channel integration) and marketing performance. Consequently, the result that was obtained from the Ordinary Least Square (OLS) can be relied upon.

Table 4: Regression Results

Number of Obs. =	361	F (2, 360)	=	59.12	
R-Squared =	0.810	Prob. > F	=	0.000	
Adj. R-Squared =	0.760				
Marp	Coefficient	Standard Error	t-value	P>/t/	[95% Conf. Interval
Hyper	0.3039	1.2300	5.22	0.000	0.5211 5.2227
Chanint	0.4001	2.2083	8.44	0.000	0.6721 8.1132
Const.	0.4949	3.4858	12.9	0.000	0.9595 13.048

Source: Author's Computation (2025)

Table 4 is the regression results for the quantum marketing strategies variables (hyper- personalization and cross-channel integration) and marketing performance of the sampled real estate business in Edo and Delta States, Nigeria. The result indicates that the model fits the data well because the measures of the independent variable (quantum marketing strategies) accounted for about 76% of the systematic variance in the dependent variable (marketing performance) as indicated by the R² corrected of 0.76. Additionally, the study found that the quantum marketing strategies variables affect marketing performance, as evidenced in the F-value which is 59.12 (p-value = 0.000 < 0.05).

Furthermore, t-values for the quantum marketing strategies (Hyper = 5.22; Prob. = 0.000 < 0.05; and Chanint = 8.44; Prob. = 0.000 < 0.05) revealed that both hyper-personalization (Hyper) and cross-channel integration (Chanint) are statistically significant and positive in explaining marketing performance. Interestingly, the regression coefficient for Hyper is 0.3039 and Chanint is 0.4001; this suggests that a unit increase in hyper-personalization and cross-channel integration would lead to approximately 31% and 40% increases in marketing performance of the real estate business in Edo and Delta States, Nigeria. This is expected given the

fundamental role quantum marketing strategies play in promoting real estate marketing performance in an era of marketing digitization. Finding on hyper-personalization and marketing performance corroborates the results of Amol (2022) who found that AI-powered personalization can increase sales force and customers-base. On the other hand, the finding on cross-channel integration and marketing performance was consistent with the results of Bader and Bin (2024) who found that cross-national integration increases marketing performance at a high level of industry concentration.

Conclusion And Recommendations

This study examines quantum marketing strategies (hyper-personalization and cross-channel integration) on marketing performance of real estate businesses in Edo and Delta States, Nigeria. The study sheds light on how the use of hyper-personalization and cross-channel integration contributes to increased marketing performance of Nigerian real estate industry. Remarkably, the results revealed that these emerging strategies have statistically significant and positive influence on marketing performance, particularly in areas of increased customer base, customer acquisition, client retention, sales growth brand loyalty and brand visibility of real estate

products/services. The implication of the result is that while hyper-personalization enhances customers' satisfaction/loyalty by delivering relevant and timely property solutions, cross-channel integration ensures a dependable engagement of customers across multiple platforms, resulting to broader market reach. Consequent upon the findings of the study, we conclude that quantum marketing strategies when effectively and efficiently used by real estate businesses can bring about increased marketing performance. On the basis of the findings, the study recommends that real estate businesses should increase their investments in quantum marketing (AI-driven, big-data analytics and machine-learning tools) because it has the potential of increasing marketing performance. In addition, real estate businesses must harmonize their digital and conventional marketing platforms in order to ensure a seamless customer experiences and strengthen brand recognition across all customers' touch-points

Abstract

This research constructs a theoretical model for comprehending risk management within Nigeria's digital banking industry, where swift technological integration enhances prospects yet also subjects banks and customers to intricate risks. The study explores the relationship between the progression of digital banking and risk exposure, the impact of consumer behavior on risk management frameworks, and the difficulties in implementing effective management strategies. Employing a qualitative method, the research combines scholarly and practical evidence to assess operational, cyber, regulatory, and financial risks, while incorporating global frameworks into Nigeria's distinct banking environment. Results emphasize cybersecurity as a significant weakness that threatens customer confidence and adoption, with system flaws and regulatory delays worsening vulnerability. However, robust risk strategies—like enterprise risk management (ERM), cyber risk governance, and transparent AI—can enhance resilience, profitability, and customer satisfaction. The research additionally shows that socio-economic and gender factors influence risk perceptions, especially within marginalized groups, highlighting the importance of inclusivity for sustainable digital finance. Suggestions highlight the need to strengthen technological and human resources, implement strong governance structures, enhance regulatory supervision, and foster risk communication that is focused on customer needs. By incorporating trust, behavioral dynamics, and sustainability into risk management, the research enhances academic discussion and provides actionable insights for policymakers and practitioners. Its significance is in offering a context-aware model that tackles Nigeria's digital weaknesses while promoting resilience, inclusivity, and enduring stability in the banking industry.

Keywords: Digital Banking, Risk Management, Cybersecurity, Customer Trust, Enterprise Risk Management (ERM) and Nigeria

Introduction

Digital banking has revolutionized financial services worldwide, with Nigeria distinguishing itself as a key adopter owing to greater mobile phone usage, internet availability, and financial inclusion initiatives. This change has increased accessibility, lowered expenses, and enhanced efficiency, creating fresh opportunities for people, companies, and the wider economy. Nonetheless, alongside these advantages exists a complicated and changing array of risks that jeopardizes the stability, trust, and enduring sustainability of the industry.

Cybersecurity issues continue to be the most significant, putting banks and customers at risk of fraud, data breaches, and operational interruptions. These risks are exacerbated by regulatory deficiencies, infrastructure shortcomings, and a lack of institutional capacity to ensure adherence.

Insufficient financial literacy increases user vulnerability, as numerous individuals and SMEs do not possess the knowledge to effectively safeguard themselves in digital settings. As a result, perceptions of risk regarding trust and security still obstruct the broader acceptance of digital banking services.

Innovative technologies like artificial intelligence serve as a double-edged sword: they provide prospects for enhanced services, yet they bring forth fresh worries regarding algorithmic bias, data privacy, and ethical utilization. Likewise, attempts to enhance digital financial inclusion—particularly for women and vulnerable populations—might inadvertently strengthen inequalities if safeguards are insufficient. Additionally, the environmental and sustainability aspects of adopting digital finance remain insufficiently investigated in Nigerian studies,

resulting in significant questions being left unresolved.

Currently, risk management methods in Nigeria are disjointed, frequently tackling singular problems without incorporating technology, regulations, user behavior, financial education, and socio-economic contexts. This disjointed strategy restricts the sector's adaptability and its capacity to maintain growth driven by innovation. Consequently, there is a pressing requirement for a comprehensive theoretical model that encompasses Nigeria's distinct setting and harmonizes innovation with consumer safeguarding. This research aims to address that gap by creating a comprehensive framework for handling risks within Nigeria's digital banking environment

Objectives of the Study

The main aim of this study is to create a thorough theoretical framework for comprehending risk management in the digital banking era specific to Nigeria.

Others consist of to;

5. investigate the connection between digital banking evolution and risk exposure by utilizing empirical and theoretical perspectives from current research to frame Nigeria's distinct banking landscape.
6. examine how customer behavior and experiences influence risk management frameworks in digital banking.
7. evaluate the difficulties and optimal strategies related to establishing efficient risk management frameworks within the Nigerian digital banking industry.
8. enhance the scholarly conversation regarding digital banking risk management by providing a structure that may guide upcoming studies and practical applications

Research Questions

1. To what extent cybersecurity and operational risks shape customer confidence and adoption of digital banking in Nigeria?
2. In what ways are risk management strategies integrated into the digital transformation processes of Nigerian banks, and which theoretical models best capture this alignment?
3. How do customers' risk perceptions influence their adoption of digital banking services, and which theoretical constructs provide the most explanatory power in the Nigerian context?
4. To what extent do socio-economic and gender-related factors affect risk management practices and the adoption of digital banking, particularly among women entrepreneurs?

Significance of the Study

The research titled "Risk Management in the Era of Digital Banking in Nigeria: A Theoretical Framework" is important as it fills essential voids in

comprehending the risks emerging from Nigeria's swift transition to digital banking. Although digital platforms enhance financial access, they simultaneously subject banks and customers to intricate issues concerning cybersecurity, trust, inclusivity, and sustainability.

The structure highlights three main areas.

Initially, it emphasizes the influence of trust and behavioral elements—especially within Nigeria's young demographic—in forming adoption and risk perceptions (Melnyk, 2023; Julia et al., 2023).

Secondly, it addresses accessibility concerns, recognizing that underrepresented groups encounter obstacles akin to those observed in other developing economies (Kameswaran et al., 2023).

Third, it modifies institutional mechanisms like Enterprise Risk Management (ERM) to fit Nigeria's regulatory and market landscape, allowing banks to methodically tackle technological and operational risks (Saputra et al., 2023).

Incorporating behavioral biases, user variation, sustainability factors, and risks arising from crises as demonstrated during the COVID-19 pandemic (Jain et al., 2023; Gurendrawati et al., 2023; Vilhena & Navas, 2023), the framework offers a comprehensive model customized for Nigeria's digital banking environment. Its importance stems from providing theoretical insights and practical advice for enhancing resilience, inclusivity, and sustainable development in the industry.

Scope and Limitation of the Study

This study analyzes risk management in Nigeria's digital banking industry, concentrating on the theoretical models that guide risk reduction in a swiftly changing financial environment. In Nigeria, as in various emerging markets, digital banking is influenced by technological, behavioral, and operational elements that establish unique risk dynamics. Through the amalgamation of technology adoption theories, consumer behavior models, and risk management principles, the research creates a comprehensive framework for comprehending and tackling these risks.

The focus is limited to the banking sector in Nigeria, while also gaining comparative insights from areas that have similar developmental paths, like Vietnam and Indonesia. Research in these areas shows how embracing digital technology impacts operational efficiency, fraud, and system weaknesses—findings that are still pertinent for Nigeria, even with variations in regulation, infrastructure, and digital literacy.

Demographic factors, especially Generation Z, millennials, and gender variations, are pivotal to the structure. Behavioral studies emphasize that opposition to technology, changing user expectations, and differing degrees of digital literacy affect susceptibility to risks like fraud and cyberattacks. Although these elements address essential user-

related risk aspects, the experiences of older or less technologically proficient groups are still not well examined.

Operational risks, such as cybersecurity threats, fraud, and system outages, are similarly tackled. Nonetheless, their evolving characteristics within Nigeria's comparatively new regulatory landscape necessitate constant reevaluation. The research also recognizes the lack of quantitative risk assessments because of restricted access to bank-specific information, limiting the evaluation to theoretical and qualitative perspectives.

In conclusion, this research provides a theoretical framework for comprehending Nigeria's digital banking risk landscape, enhanced by international comparisons yet constrained by contextual differences, demographic emphasis, and data restrictions. It is suggested that future studies utilize longitudinal data and case studies specific to institutions to confirm and enhance the suggested framework

Literature Review

Introduction

Digital banking has quickly revolutionized financial services globally, with Nigeria becoming a significant adopter. Although it improves accessibility and efficiency, it also presents considerable risks to users and institutions, thereby making effective risk management crucial. Research in various contexts offers essential insights into Nigeria's digital banking environment.

Theories of adoption highlight vulnerabilities associated with users. Alnemer (2022) utilizes the Technology Acceptance Model to pinpoint perceived ease of use and usefulness as essential factors, whereas Musyaffi et al. (2022) combine Technology Readiness and Technology Acceptance models to emphasize the significance of technological readiness. These viewpoints highlight risks associated with digital literacy gaps, reluctance to embrace innovation, and security issues—all very pertinent in Nigeria.

Customer interaction introduces an additional level of risk. Levy (2022) illustrates that the type of platform influences loyalty via psychological involvement, whereas Alabi et al. (2023) indicate that customer views directly impact service adoption. In Nigeria, where trust is tenuous due to cyber fraud, risk strategies focused on customers are essential.

Institutional and socio-economic elements add complexity to the adoption process. Kaur et al. (2021) demonstrate that combining physical and digital channels reduces adoption risks, a strategy appropriate for Nigeria's infrastructural limitations. Alabi et al. (2023) present digital banking as a facilitator of financial inclusion while also highlighting increased cyber, privacy, and operational risks, emphasizing the importance of regulatory protections.

Contexts specific to sectors also require focus. Sutikno, Nursaman, and Mulyat (2022) emphasize that Sharia banks need to integrate digital advancements with adherence to religious principles, a crucial factor for Nigeria's Islamic banking industry

Concept of Risk Management

Technical Models

Risk management in financial organizations entails recognizing, evaluating, and minimizing risks to stability. Historically centered on credit, market, and liquidity risks, digital banking has expanded its focus to include cybercrime, technological weaknesses, operational issues, and compliance hurdles. In Nigeria, as adoption increases despite infrastructural and socio-economic challenges, quantitative methods like Extreme Value-at-Risk (EVAR) help banks gauge possible losses and implement precautionary strategies (Saputra et al., 2022).

Behavioral Models

In addition to technical protections, customer views affect adoption and exposure to risk. The Technology Acceptance Model (TAM) illustrates how views on reliability, usefulness, and security influence consumer trust and readiness to adopt digital platforms (Ghani et al., 2022; Nguyen, 2020). This highlights that risk management should focus on both technological robustness and user trust.

Institutional and Regulatory Factors

External factors greatly influence results. The quality of governance, stability of regulations, and levels of corruption influence exposure, suggesting that technical measures are inadequate without robust institutional frameworks (Syed et al., 2022). Innovative technologies like artificial intelligence, machine learning, and blockchain offer predictive oversight and automated reactions, yet they also create new vulnerabilities that necessitate flexible frameworks (Indriasari et al., 2022). Efficient risk management frameworks in financial organizations necessitate robust administrative and institutional capability; as shown by Omoyemi and Okereka (2025) in their research on disaster management agencies in the Niger Delta, inadequate administrative structures can impair the capacity to recognize, reduce, and address risks.

Customers Trust

Customer trust serves as a key factor in digital risk. Research indicates that favorable views on service quality, responsiveness, and security lower the occurrence of fraud, disputes, and service abandonment, thus decreasing reputational risks (Harb, Thoumy, & Yazbeck, 2022).

In general, managing risks in digital banking must be adaptive, incorporating technological advancements, regulatory supervision, and behavioral understanding

into holistic structures for tackling existing and upcoming challenges (Indriasari et al., 2022)

Digital Banking in Nigeria (Concise Journal-Style Summary)

Digital banking in Nigeria is transforming financial services via internet and mobile platforms, driven by increased connectivity, smartphone adoption, and financial inclusion strategies (Wewege, Lee, & Thomsett, 2020; Galal, Rady, & Aref, 2022). A young, technologically proficient population and the COVID-19 outbreak have hastened the adoption process (Egala, Boateng, & Mensah, 2021; Prokopenko et al., 2022).

Nevertheless, expansion brings risks—cybersecurity threats, fraud, data privacy concerns, and lax regulations erode trust (Kaur et al., 2021; Kornelis, 2022). Blockchain has the potential to improve security, transparency, and efficiency; however, user acceptance depends on perceived trust and user-friendliness (Kumari & Devi, 2022). Digital disruptions present operational hazards such as system breakdowns and reliance on external vendors, necessitating robust IT infrastructure and proactive risk management (Wewege et al., 2020).

Customer satisfaction relies on usability, security, and reliability of the platform; clear risk communication can enhance trust and retention (Kaur et al., 2021). Ensemble modeling and other predictive analytics can identify churn and facilitate focused retention strategies (Galal et al., 2022)

Types of Risks in Digital Banking

The growth of digital banking in Nigeria has brought various risks that need careful oversight. With the expansion and integration of services into the financial system, these risks have become increasingly intricate. Grasping their significance is crucial for safeguarding the financial system and preserving consumer confidence. Researchers pinpoint significant risks associated with digital banking, such as technological, operational, financial, and regulatory hurdles specific to Nigeria

Cybersecurity Risks

Cybersecurity risks dominate Nigeria's digital banking landscape, with rising threats of fraud, breaches, and system attacks undermining trust (Gigante, Martin, & Marutani, 2022; Jiang & Taskin, 2022). Adoption is highly dependent on perceived security (V. & Dr. J., 2022), as seen in Indonesia where consumer trust drives uptake (Tanika et al., 2022). COVID-19 amplified vulnerabilities through remote access and increased transaction volumes (Aniqoh, Nihayah, & Amalia, 2022), while weak controls, poor integration, and low staff training further expose systems (Siek & Rukma, 2022). With consumers often trading security for convenience (Aisha & Rakesh, 2022), Nigerian banks must

combine advanced defenses, governance, and customer education to foster trust and inclusion.

Operational Risks

Operational risks in Nigeria's digital banking sector stem from system malfunctions, human mistakes, and cyber threats, leading to service interruptions and a loss of trust (Rodrigues, Rodrigues, & Oliveira, 2022; Mbama & Ezepue, 2018). Low literacy and reluctance towards technology increase vulnerability (dos Santos & Ponchio, 2021), while favorable conditions and ease of use mitigate threats (Nguyen et al., 2020). The pandemic exposed significant deficiencies in resilience and disaster recovery (Mawarni, 2021; Riza, 2021). Consequently, effective management necessitates strong IT, readiness for crises, and systems focused on customers to maintain dependability and competitiveness (Tiong, 2020).

Reputational Risks

Reputational risk—loss of confidence due to breaches, outages, or privacy issues—has increased with Nigeria's swift digital transformation (Nguyen, Kim-Duc, & Freiburghaus, 2021; Musyaffi & Jakarta, 2021). Inadequate infrastructure and inconsistent digital preparedness enhance susceptibility, while views on regulatory supervision influence consumer trust. Effective communication, data security, and swift incident response are crucial (Nguyen et al., 2021). Quantitative models support forecasting, yet sentiment analysis is essential (Marks, 2020; Zhou, 2017). As incidents such as cyberattacks can heighten reputational damage (Kreibich et al., 2022), financial institutions should integrate reputational risk into their overall strategies, ensuring that security, compliance, and customer service work together to protect trust (Froot, Scharfstein, & Stein, 1992)

Theoretical Framework

The evolving environment of digital banking in Nigeria requires strong theoretical bases to efficiently tackle technological disruptions, cyber threats, regulatory challenges, and operational risks. Theoretical frameworks offer organized methods to recognize, evaluate, and reduce risks, guaranteeing resilience and sustainability in financial systems. This section consolidates essential frameworks pertinent to risk management in digital banking, emphasizing their relevance to the Nigerian environment. Efficient risk management in Nigeria's banking industry necessitates an organized framework that tackles operational, market, and technological risks; as Mukoro (2023) points out, institutions like Union Bank PLC encounter issues like lack of employee training and poor technological infrastructure, which may weaken risk mitigation strategies

Proactive Risk Management focuses on foreseeing issues instead of merely responding. Smith and Merritt (2020) contend that ongoing recognition and management of potential risks enhance resilience and adaptability—essential in Nigeria’s rapidly changing digital environment where cybercrime and regulatory changes are common.

Cyber Risk Management Frameworks incorporate technical protections, policy strategies, and human elements. McShane, Eling, and Nguyen (2021) highlight models that adapt and grow in response to new cyber threats. In Nigerian banks, where cybercrime is prevalent, incorporating such frameworks enhances systemic integrity and incident response capabilities.

IoT Cybersecurity Frameworks tackle risks stemming from connected devices that are being more frequently employed in customer interactions and transaction oversight. Lee (2020) supports multi-layered security and immediate analytics. This is especially important for Nigerian banks implementing IoT technologies in the context of weak cybersecurity systems.

Data Analytics and Explainable Artificial Intelligence (XAI) enhance operational risk management. Araz et al. (2020) show how predictive analytics improve risk detection, whereas Bussmann et al. (2020) emphasize the importance of XAI for promoting transparency, accountability, and adherence to regulations. In Nigeria, these systems allow banks to enhance fraud detection, credit assessment, and compliance oversight.

Risk Governance Frameworks, according to Sheedy (2021), highlight accountability, transparency, and the evaluation of systemic risk. These governance principles can be applied to digital banking, where collaboration among stakeholders and multi-level coordination are crucial for tackling regulatory and reputational issues.

Strategic Risk Management and CSR enhances risk frameworks even more. Godfrey (2005) defines CSR as a tool for alleviating risks and enhancing reputation. For Nigerian digital banks, integrating CSR into risk management improves legitimacy, customer confidence, and enduring sustainability.

Enterprise Risk Management (ERM) offers a comprehensive framework that combines operational, cyber, strategic, and reputational risks into a single model. Aven (2016) emphasizes the interconnections of risks, whereas Kamiya et al. (2019) underscore the financial and reputational consequences of cyberattacks. Integrating machine learning and explainable AI into ERM (Leo, Sharma, & Maddulety, 2019; Bussmann et al., 2019) enhances forecasting and compliance abilities. Additionally,

the integration of CSR into ERM (Godfrey, Merrill, & Hansen, 2009) guarantees conformity with stakeholder expectations. The iterative characteristics of ERM also allow for external shocks, like pandemics (Agca et al., 2016; Crook et al., 2021), via contingency planning and strategies for business continuity.

Applicability to the Study

These frameworks together establish the theoretical basis for examining risk management within Nigerian digital banking. Proactive and cyber risk frameworks emphasize the necessity of foreseeing threats amid increasing cybercrime. IoT, data analysis, and XAI frameworks illustrate how new technologies can enhance risk detection and clarity. Governance and CSR models highlight responsibility, reputation, and stakeholder confidence. Ultimately, ERM combines these viewpoints into a holistic, flexible, and socially accountable strategy. Collaboratively, they steer this research to assess how Nigerian banks can create robust risk management frameworks that protect financial stability while enhancing customer trust in the digital age.

Existing Studies and Gaps

The growth of digital banking in Nigeria has heightened the demand for customized risk management strategies. Current literature offers valuable bases but is frequently restricted in extent or context. Sax and Andersen (2018) emphasize the integration of enterprise risk management (ERM) within organizational strategy, whereas Florio and Leoni (2017) associate ERM with improved performance in European companies. However, these studies represent advanced economies and disregard Nigeria’s infrastructure and regulatory issues.

Studies concentrated on particular risks provide limited understanding. Alshatti (2017) indicates that effective credit risk management improves bank performance, applicable to digital lending yet limited in focus. Paté-Cornell et al. (2018) highlight cyber risks in critical infrastructure, stressing the importance of cybersecurity, though not specifically addressing banking. Additional research (Wieland, 2017; Brustbauer, 2016) offers insights on systemic and organizational risks, whereas Asravor (2018) emphasizes behavioral risk preferences, which are important for comprehending customer trust in digital platforms. As Erude, Okereka, and Taiwo (2024) observe in their study of public enterprise failures, weak institutional frameworks remain a critical source of systemic risk in Nigeria; this insight is equally relevant to digital banking, where fragile governance mechanisms heighten exposure to cyber, operational, and regulatory threats. Organizational structures and reward systems significantly influence staff commitment and operational efficiency, which indirectly affect risk exposure in financial institutions;

Mukoro and Ekpu (2024) note that outdated reward systems and poor interdepartmental coordination can compromise institutional stability and service quality. Nonetheless, their sectoral contexts restrict direct application to banking in Nigeria. Combining these studies uncovers significant omissions. Limited research combines cyber, credit, operational, and strategic risks within a single framework for Nigeria's digital banking industry. ERM models continue to be insufficiently tested in settings characterized by fragile infrastructure, changing regulations, and socio-economic complexities. Behavioral elements—like digital literacy, trust, and cultural perspectives—are insufficiently examined even though they impact adoption and risk awareness. Additionally, existing frameworks typically do not fully address the rapidity and intricacy of technological risks like cyberattacks, fraud, and data breaches. Many research efforts are focused on the West and overlook Nigeria's institutional vulnerabilities, regulatory irregularities, and limited cybersecurity awareness.

In summary, although current studies offer important perspectives, they fall short in reflecting Nigeria's actual conditions. Adaptive, context-specific risk management frameworks are necessary to integrate various risks along with institutional and behavioral aspects to foster the sustainable development of digital banking

Research Methods

This research utilizes a qualitative methodology based on a theoretical framework to explore risk management in the realm of digital banking in Nigeria. Selecting a qualitative approach is warranted by the study's aim to offer a comprehensive insight into the various risks—operational, technological, cyber, regulatory, and financial—that define digital banking, along with the strategies and frameworks established to address them. In contrast to quantitative approaches that focus on numerical data, qualitative research facilitates deep understanding of intricate processes, contextual factors, and regulatory specifics influencing digital banking practices (Creswell & Poth, 2018).

Research Design

The study employs a structured qualitative review of academic and non-academic sources to encompass both theoretical perspectives and practical aspects of risk management in digital banking. This method facilitates the combination of theoretical models with real-world data, guaranteeing a comprehensive grasp of the topic. Through a synthesis of current literature, the research assesses the intersection of global risk management strategies with Nigeria's developing digital financial landscape.

Sources of Data

Data for this study were drawn exclusively from secondary qualitative sources, with a deliberate focus on authoritative and credible materials. The sources included:

1. Peer-reviewed journal articles – accessed through databases such as JSTOR, ScienceDirect, and Google Scholar, ensuring engagement with current academic debates.
2. Books and monographs – providing theoretical foundations on enterprise risk management, digital banking, and financial regulation.
3. Regulatory and policy documents – including reports and guidelines from the Central Bank of Nigeria (CBN), Nigeria Deposit Insurance Corporation (NDIC), and international regulatory bodies such as the Bank for International Settlements (BIS).
4. Industry and professional reports – published by institutions like PricewaterhouseCoopers (PwC), KPMG, and Deloitte, offering insights into practical challenges and best practices in digital banking risk management.
5. Recent empirical studies (2015–2024) – focusing on global and Nigerian experiences of digital transformation in banking, to capture contemporary challenges such as cybercrime, fintech disruption, and compliance complexities.

Data Collection and Analysis

A structured process of identification, screening, inclusion, and synthesis was employed to conduct a systematic literature review (SLR). Search keywords encompassed “risk management in digital banking,” “cybersecurity within Nigerian banks,” “operational challenges in digital finance,” and “regulatory structures for financial technology.” The criteria for inclusion focused on studies released from 2015 to 2024 to maintain relevance to contemporary technological and regulatory environments.

The chosen literature underwent thematic analysis, facilitating the discovery of consistent patterns, developing trends, and theoretical gaps. Thematic coding facilitated the classification of risks (e.g., operational, cyber, compliance) and management approaches (e.g., enterprise risk management, regulatory compliance frameworks, technological protections). This analytical approach enabled the creation of a conceptual framework specifically designed for the Nigerian digital banking industry, connecting international theories with domestic realities.

Ethical Considerations

This research is based entirely on publicly accessible secondary sources, thus it did not engage human participants or gather primary data. Nonetheless, focus was placed on the trustworthiness, dependability, and ethical application of information

through precise referencing and compliance with academic integrity norms.

Analysis, Findings, and Discussion

The rise of digital banking in Nigeria has changed banking practices but also brought about intricate risks necessitating strong management systems. This research, based on theory and data, emphasizes the key risk factors and assesses the success of current practices.

A crucial discovery is the increased vulnerability to cyber threats. Wang, Nnaji, and Jung (2020) highlight a rise in cybersecurity incidents within Nigerian internet banking, revealing weaknesses in system protocols and diminishing customer confidence. In a similar vein, Omotosho (2021) demonstrates that security vulnerabilities and system inadequacies hinder the mobile banking user experience, emphasizing the need to incorporate advanced cybersecurity strategies into risk frameworks. The use of digital media and technology improves data gathering and decision-making, vital for overseeing and controlling operational risks; Okereka, Orhero, and Okolie (2024) emphasize how digital platforms boost research precision and effectiveness, a concept that directly relates to risk management in digital banking.

Risk management additionally impacts financial outcomes and customer contentment. Madugba et al. (2021) identify a favorable connection between the adoption of electronic banking and the profitability of banks, indicating that effectively managed risks improve financial results. Raji, Zameni, and Abdulwakil (2021) additionally demonstrate that customer satisfaction relies on trustworthy and safe digital services, highlighting risk management as a protective and strategic instrument.

Operational risks encompass interbank transactions. Nwaozomudoh et al. (2021) suggest a framework aimed at enhancing transaction precision, emphasizing systemic vulnerabilities stemming from mistakes and breakdowns in communication. This corresponds with Adewoye and Obasan (2012), who contend that IT adoption necessitates simultaneous reforms in organizational procedures and employee skills, merging technological and human resource aspects in risk management. On theory foundation The conversation also includes sustainability and governance. Nwagwu (2020) highlights the importance of management education in promoting sustainable banking practices and preparing professionals to foresee risks arising from digital transformation. Incorporating sustainability into risk frameworks guarantees considerations for ethics, regulations, and long-term resilience.

Obstacles continue to exist. Weaknesses in infrastructure—like inconsistent electricity and insufficient broadband—and regulatory shortcomings impede efficient risk management (Wang et al., 2020; Nwaozomudoh et al., 2021). Regulatory reactions

frequently fall behind advancements, making compliance and enforcement more challenging. Thus, context-aware, adaptive models are critical.

The human element continues to be crucial. Adewoye and Obasan (2012) emphasize that training employees and enhancing their skills are vital for handling digital risks, aligning with Nwagwu's (2020) appeal for ongoing professional growth. In the same way, consumer behavior affects risk exposure; Raji et al. (2021) note that views on reliability and security promote adoption, whereas adverse experiences heighten susceptibility to mistakes and fraud. Therefore, customer education should be integrated into risk strategies

Conclusion

A robust risk management framework for Nigeria's digital banking industry should be multifaceted—integrating technological protections, institutional capability, customer interaction, sustainability, and regulatory supervision. Although cybersecurity is the foremost threat, efficient risk management additionally boosts performance, trust, and competitive edge. Harmonizing technical systems with human and organizational elements provides a more comprehensive and flexible method.

Recommendations

In line with Erude and Mark's (2023) assessment of contingency theory, effective risk management in Nigeria's digital banking sector requires adaptive frameworks that respond to contextual factors such as regulatory shifts, technological disruptions, and customer behavior, rather than relying on rigid, uniform models.

The following are recommendations for all stakeholders viz practitioners cum policy makers:

Strengthen Technological and Human Capacity

Banks need to allocate resources to sophisticated cybersecurity technologies (encryption, multi-factor authentication, real-time fraud detection) and consistently educate staff to improve awareness and strength against digital threats.

Adopt Robust Risk Governance Frameworks

Incorporating digital risk management into enterprise risk governance, featuring defined accountability, flexible controls, and ongoing monitoring, is crucial to tackle the changing threat landscape.

Enhance Regulatory Oversight and Collaboration

Regulators need to create transparent digital banking standards, conform to international best practices, and encourage cooperative frameworks among banks, governmental bodies, and tech providers to enhance resilience across the sector.

Promote Customer-Centric Risk Communication

Banks should emphasize clear communication and educate customers on secure digital habits to foster trust, decrease fraud risks, and enhance customer loyalty.

Contributions to Knowledge

1. This research emphasizes the relationship among customer trust, risk communication, and behavioral intention as vital factors influencing the adoption of sustainable digital banking in Nigeria.
2. It broadens the discussion on risk management by connecting technological, institutional, and regulatory approaches within a cohesive framework designed for emerging economies.

Does Risk Management Drive Financial Performance of Companies in Era of Digital Transformation?

EGBERI, Kelvin Agbarha

Department of Business Administration,
Southern Delta University, Ozoro, Nigeria

Publication Date: 2025/11/28

Abstract

The study investigates whether risk management drive financial performance of companies in era of digital transformation in Nigeria. Digital transformation era spanning from the period 2014-2024 and ex-post-facto research design were used. Two (2) risk management measures, liquidity and capital adequacy risks and one(1) financial performance measure was employed. The study obtained a sample of fifteen (15) industrial and consumer goods companies listed on Nigerian Exchange Group. Data obtained were analyzed via a combination of descriptive, regression diagnostic and inferential statistical tools. The panel-corrected standard errors regression result revealed that liquidity risk (Z-score = 7.37; Probability = 0.000 < 0.05%), and capital adequacy risk (Z-score = 6.57; Probability = 0.000 < 0.05%) significantly affect the level of financial performance. The implication is that efficient risk management vis-à-vis liquidity and capital adequacy risks drive financial performance, particularly in era of digital transformation. The study recommends among others that the management of listed industrial and consumer goods companies should consider incorporating broader and industry-specific risk management systems like operational, supply chain, and foreign exchange risks together with traditional financial risks in their risk management framework. Also, there is the burning need for more inclusive digital system in the risk management frameworks of listed industrial and consumer goods companies in Nigeria. This study contributes to knowledge as it offers a more critical assessment of risk-performance relationship of industrial and consumer goods companies in era of digital transformation.

Keywords: Risk management; Liquidity risk; Capital adequacy risk; Credit risk; Digital era

Introduction

Practically, business's main goals are to maximize shareholders' wealth, earn a profit and run smoothly. Consistent profitability allows businesses to provide important stakeholders, including shareholders, creditors, and employees, with sufficient returns even in difficult or uncertain business circumstances. However, this goal may be hampered by a number of dangers, particularly in era of digital transformation (Adebayo & Olamide, 2021). Olawole (2024) asserts that effective risk management can improve organisational performance in every industry. Better financial results are supported, strategic planning is strengthened, service delivery is enhanced, competitive advantage is sharpened, resource utilisation is optimised, and unforeseen disruptions are reduced.

Proactive risk management, according to Ojo and Olaleye (2022), entails ongoing risk identification and assessment in order to help avert unanticipated circumstances that might interfere with operations. Risk management is more important than ever during pandemics, global crises, and digital change because it enables businesses to take advantage of

opportunities while reducing risks. When a business's revenue surpasses its operating and indirect expenses and shareholder wealth rises as a result of consistent dividend payments and capital gains connected to the expansion of the business, profitability is achieved (Johnally & Toyin, 2023). Protecting assets and cutting costs require an understanding of business risks, whether they be accidental, financial, strategic, or operational. Effective risk management guarantees a safe investment for all parties involved.

Avoiding significant unforeseen consequences, whether favourable or unfavourable, that diverge from businesses' expectations is the main objective of risk management. By continuously recognising and reducing possible risks, firms can more effectively accomplish their financial objectives through effective risk management. Strong risk management skills set sustainable and productive manufacturing companies apart (Uwuigbe & Fakile, 2020). Identification of risk patterns and evaluation of the efficacy of controls are further facilitated by a strong risk management system, which includes ongoing monitoring, cyber-security awareness, and internal audits. According to Fali, Nyor, and Mustapha

(2020), the first step in the risk management cycle is to match risk initiatives with organisational realities and strategic goals. Inherent hazards are identified, risk analysis and appraisal are carried out, reporting, decision-making, treatments, monitoring, and residual risk assessment are the next steps in this process.

Furthermore, to maximise success and reduce failure, organisations must manage risk in a proactive and strategic manner by incorporating it into their everyday operations. According to Adamgbo, Toby, Momodu, and Imegi (2019), risk management is an essential component of business that lowers the likelihood of losses and aids organisations in achieving their objectives. Management must identify susceptible regions and possible exposures in order to protect against financial risks. The relationship between risk management and financial performance is still unknown, despite the fact that numerous research have examined how risk management influences financial risk in Nigerian manufacturing organisations. Although it is generally accepted that risk management improves performance, the fundamental issue is the mismatch between risk management and the financial performance of Nigeria's publicly traded consumer goods and industrial enterprises in the age of digital transformation. Arising from the above discuss, the study was set out to achieve two (2) specific objectives:

- (i) To examine the effect of liquidity risk on financial performance of listed industrial and consumer goods companies in Nigeria; and
- (ii) To ascertain the effect of capital adequacy risk on financial performance of listed industrial and consumer goods companies in Nigeria.

Review of Related Literature

Risk Management

Owolabi and Ajayi (2021) noted that business risk is the uncertainty that exists in a company's operating environment, which is frequently demonstrated by fluctuations in operating income and can have a negative impact on profitability. Risk management is the process of identifying, evaluating, prioritising, and mitigating the negative effects that uncertainty causes (Uwuigbe & Fakile, 2020). In this context, risk management is a structured approach to minimising the negative outcomes of specific events. Risk is an exposure to threats or uncertainty, and while it can present challenges, it can also provide economic benefits, as firms can make significant profits by taking calculated risks.

According to Oluwagbemi and Adebisi (2021), risk is inextricably linked to opportunities and threats that may have an impact on planned activities or results. Risk, according to Oluwagbemi and Adebisi (2021), is "uncertainty that matters" in a business context.

The possibility that actual returns will differ from predicted returns is a common definition of risk in the context of finance. Okoye and Eze (2020) opined that risk management is a thorough procedure carried out by the board, executives, and employees of an organisation. It is included into enterprise-wide initiatives and strategic planning with the goal of identifying possible occurrences that might have an impact on the company and controlling these risks to manageable levels.

Consequently, this provides an acceptable level of certainty that the organization's goals will be met. The fundamental steps in the risk management process are risk identification, assessment, and mitigation, followed by activity monitoring and control that may result in losses, usually monetary ones. A systematic and generally recognised strategy to risk management is described in project management literature (Ogunode, Awoniyi & Ajibade, 2022). Ogunode et al. (2022) assert that choosing the right risk mitigation technique lowers the uncertainty associated with a risk as well as the possibility or impact of it happening.

Liquidity Risk

Liquidity risk and operational funding liquidity risk are the two primary parts of liquidity risk. According to Eze and Okoye (2020), operational funding liquidity is the company's capacity to handle daily cash flow, whereas asset liquidity is the ease with which a corporation may turn its assets into cash in times of unexpected or pressing need. If a business cannot make enough money to pay for its basic operational costs, a large or seasonal decline in sales could be a major concern. This explains why analysts and investors closely consider metrics like free cash flow when evaluating a company's investment prospects and emphasises the significance of efficient cash flow management for business sustainability (Ene & Inyang, 2021).

Liquidity, as defined by Ene and Inyang (2021), is the ease and speed with which a security or asset can be exchanged for money on the market. Two primary categories of liquidity risk can be distinguished. The first is cash flow risk, often known as funding risk, which relates to a business's capacity to pay its debts. Corporate treasurers must make sure there are enough money on hand to cover liabilities, therefore this is a top priority (Odubuasi et al., 2020). The fast ratio and the current ratio are typical measures of this risk. The inability to sell an asset quickly without compromising its value is known as market or asset liquidity risk, or simply when assets become difficult to liquidate.

According to Ndubuisi (2022), liquidity risk is the incapacity of organisations or people to meet short-term financial obligations since it is difficult to turn assets into cash without suffering losses. Businesses might be compelled to sell securities or other assets below their market value in such a scenario. Poor

market efficiency, cash flow constraints, the asset's nature, urgency, and unfavourable market conditions are some of the causes of this (Egbunike & Okoye, 2020). Egbunike and Okoye (2020) added that it is critical for investors and businesses to comprehend and control liquidity risk. It helps individuals make wise choices, guaranteeing that they can continue to fulfil their financial commitments. Entities may purchase assets that are challenging to sell without incurring losses or financial pressure if they are not properly informed of the risks associated with liquidity.

Capital Adequacy Risk

Given Nigeria's economic instability and regulatory requirements, Capital Adequacy Risk (CAR) is still a major concern for publicly traded manufacturing enterprises in the nation. Maintaining a strong capital base is crucial for a company's ability to withstand financial shocks and remain resilient during recessions (Ogunode et al., 2022). The efficiency with which manufacturing companies in Nigeria handle their capital structure is a crucial component of CAR. According to research, keeping enough funds on hand is essential for reducing risks, particularly those associated with debt and market volatility. For instance, the study by Ogunode et al. (2022) highlights the significance of optimising capital composition to maintain profitability and lower financial risk, noting that the capital adequacy ratio influences both risk exposure and profitability.

Numerous studies indicate a high correlation between a firm's capital strength and its financial stability, generating significant scholarly interest in the relationship between capital adequacy and financial success. Maintaining sufficient capital levels is essential for Nigerian manufacturing companies to manage operational risks like credit exposure and liquidity issues. Adequate capital acts as a safeguard against these dangers, especially when the economy is unstable. According to research by Asogwa and Isinguzo (2017), companies that use good capital management techniques typically outperform their competitors and are better equipped to handle market volatility, which is a prevalent problem in Nigerian company.

Furthermore, a firm's liquidity is directly impacted by CAR. A healthy capital adequacy ratio not only increases liquidity but also allows businesses to pay their financial obligations without sacrificing operational performance, according to numerous studies conducted in Nigeria. On the other hand, inadequate capital management can lead to shortages in liquidity, which increases a company's vulnerability to outside financial strains. According to Adamgbo et al. (2019), having enough capital reserves improves a company's liquidity position and lowers its vulnerability to financial instability. Another crucial element in controlling capital adequacy concerns for Nigeria's listed manufacturers

is regulatory oversight. Minimum capital requirements are set by standards like the Basel III framework to make sure businesses can survive economic crises.

According to Olawale (2024), Nigeria's capital adequacy regulations support the stability of individual businesses as well as the overall well-being of the financial system. Stricter adherence to these guidelines is recommended by the study in order to protect businesses from systemic threats and guarantee their long-term survival. In conclusion, the long-term prosperity of Nigerian listed manufacturing companies depends on their ability to successfully manage capital adequacy risk. Businesses can manage liquidity, absorb losses, and reduce their vulnerability to external risks with the support of a solid financial foundation. There is proof that risk management and financial performance are closely related to capital adequacy levels. Therefore, in the face of persistent economic uncertainty, manufacturing enterprises must prioritise capital optimisation and regulatory compliance in order to achieve sustainable growth and financial resilience.

Financial Performance

Performance is a general term that describes some or all of an organization's operations during a given time period, frequently in connection with managerial accountability, cost effectiveness, and other relevant aspects. As a result, performance encompasses both the calibre of results attained and task execution. It is a gauge of an organization's operational state, success, and compliance with objectives (Adeniyi & Ojo, 2021). Performance, according to Akinleye and Olanipekun (2021), is the process of calculating the financial results of a business's plans and operations. They stress that performance gives information about a company's financial health over a specific time period by showing how well it is reaching its goals and adhering to standards.

Financial performance can also be used to evaluate the success of the industry as a whole or to compare similar businesses within the same industry. A important component of financial performance is profitability; return on asset (ROA) is a crucial indicator of how well a business uses its assets to produce net income (Adeniyi & Ojo, 2021). According to Adeniyi and Ojo (2021), a higher ROA denotes more effective resource use. Since it shows how well management can generate profits from the company's asset base, ROA is frequently considered a crucial accounting metric of performance. It is computed by dividing total assets by earnings after taxes. ROA served as the study's financial performance metric.

Theoretical Framework

A number of theoretical frameworks aid in the comprehension of risk management systems in

businesses. Stakeholder theory, resource dependence theory, neo-institutional theory, and conventional models like financial and agency theory are among them. Agency theory, which sees the company as a contractual arrangement between managers (agents) and shareholders (principals), is frequently used to analyse corporate risk management. While shareholders trust managers to work in their best interests, managers are given the power to make decisions (Jensen, 1983 referenced in Adeniyi & Ojo, 2021). However, because it focusses exclusively on the financial structure of organisations, this framework has a limited reach.

Furthermore, it draws attention to conflicts of interest that develop when management and stockholders have unequal access to information. In order to reduce management-related risks, Jensen (1986), referenced in Akinleye and Olanipekun (2021), highlighted the necessity of procedures that match managerial interests with those of shareholders. These mechanisms might be external, like market-based forces like takeover threats or the auditing profession, or internal, like legal frameworks like the board of directors and general meetings. Stakeholder theory, on the other hand, broadens the conventional business viewpoint to encompass all stakeholders in addition to shareholder interests.

Akinleye and Olanipekun (2021) assert that the notion of stakeholders expands managerial accountability and promotes more inclusive decision-making. It sees the firm as a coalition of different interest groups and is one of the most often used frameworks in academic discourse. According to Freeman, this viewpoint empowers managers to make more advantageous and strategic choices. However, Donaldson and Preston delineated three aspects of stakeholder theory: Descriptive (which explains how firms actually function and interact with their environment); Instrumental (which demonstrates how managing stakeholder relationships helps achieve firm objectives); and Normative (which legitimises the interests of stakeholders, not just shareholders, and provides an ethical foundation for decision-making).

The manager's position is thus reshaped by stakeholder theory, which proposes that in order to lower risks and improve total value creation, they should endeavour to balance the interests of all stakeholders involved in the company. Another viewpoint is provided by the new institutional economics perspective. It looks at how businesses legitimise themselves by embracing socially and culturally accepted practices. To preserve the legitimacy of their company, managers try to match their choices—whether in financing, governance, or investment—with what society expects (Suchman, 1995 cited in Adeniyi & Ojo, 2021). The idea that a company's actions are consistent with recognised standards and values is what is meant by legitimacy in this context. In addition to strategic considerations,

decisions like changing the board's size are taken to satisfy social legitimacy requirements. More responsible behaviour may result from managers being inspired to better manage social and environmental risks by this emphasis on legitimacy. Furthermore, this hypothesis suggests that by lowering the firm's risk exposure, shareholders could seek to draw in large investors (blockholders).

Empirical Studies

Ososuppor and Okoro (2023) looked into the connection between the firm value of quoted banks in Sub-Saharan Africa and enterprise risk management by using a post-examination research design. A sample of twenty-seven (27) commercial banks was gathered from three (3) Sub-Saharan African regions: South Africa, Kenya, and Nigeria. The firm value (Tobin's Q) is the dependent variable, and enterprise risk management (as determined by enterprise risk management size, independence, and disclosures) is the independent variable. The annual reports and accounts of the banks in Sub-Saharan Africa that were sampled between 2012 and 2021 provided secondary data. Inferential statistics (principal component analysis, fixed and random effects panel data regression), diagnostic statistics (variance in inflation factor, heteroscedasticity, Ramsey regression specification-error test, Cameron and Trivedi's decomposition of IM-test), and descriptive statistics (mean, median, standard deviation, kurtosis, skewness, and Pearson correlation) were used to analyse the data. According to the fixed and random effects panel data regression results, enterprise risk management size insignificantly and negatively affects firm value in Sub-Saharan Africa, whereas enterprise risk management independence and enterprise risk management disclosure positively and significantly affect firm value.

Isedu and Erhabor (2021) used regression analysis to look at how financial risks affected the performance of Nigerian deposit money institutions. The performance of the bank was not adversely affected by the combined financial concerns. In particular, market risk, interest rate risk, and operational risk did not significantly affect bank performance over the study period, whereas credit risk did not exhibit a significant link with performance. Liquidity risk, on the other hand, had a considerable impact. Efuntade and Akinola (2020) used panel regression to examine the financial performance and business features of Nigerian manufacturing companies from 2005 to 2018. They concluded that there is a considerable relationship between firm characteristics and performance, noting that ROA is strongly influenced by business size, age, liquidity, sales growth, and leverage.

The financial risk and performance of commercial and service enterprises listed on the Nairobi Securities Exchange (NSE) were examined by Onsongo, Muathe, and Mwangi (2020). Credit risk

had a positive but negligible impact on ROE, liquidity risk had a considerable negative impact, and operational risk had a positive but negligible impact, according to their analysis of panel data from 2013–2017 using an explanatory research design and a random effects model. While the negative liquidity coefficient indicated liquidity issues with current liabilities exceeding assets, the positive credit risk coefficient revealed that businesses expanded credit uptake to improve performance.

Using secondary data from 2014–2018 and a causal research approach, Odubuasi, Oshilim, and Ifurueze (2020) examined the market risks and financial performance of Nigerian oil and gas companies. Multiple regression studies, descriptive statistics, and correlation revealed that the exchange rate had a substantial impact on both ROA and ROE, the interest rate had a large impact on ROE but not ROA, and changes in the price of commodities and stocks had no discernible impact on performance. Ironkwe and Osaat (2019) used data from 1986 to 2016 to examine risk asset management and financial performance in Nigerian insurance companies. They came to the conclusion that ROE, ROA, and leverage risk are significant short- and long-term predictors of risk asset management by using the Johansen co-integration and error correction models.

Nyameh et al. (2019) evaluated the impact of risk management on the performance of 20 Nigerian companies that were registered in Taraba State with the Corporate Affairs Commission (CAC). Through the use of descriptive statistics and correlation matrices to analyse annual reports and financial statements, the study demonstrated that while the presence of a Chief Risk Officer had a negative impact on performance, risk management committees, financial expertise, audit committees, and board size had a positive impact. Half of the risk management factors considered in the current analysis were covered in this investigation.

Adegbola et al. (2019) used secondary data using a descriptive design to evaluate the effect of ERM on the performance of a subset of Nigerian manufacturing enterprises. The results showed a strong positive correlation between ROE and ERM practices as well as between ROE and liquidity (current ratio). On the other hand, ROE had a negative relationship with leverage (the debt-to-equity ratio). However, the study only looked at manufacturing and utilised ROE, which isn't a complete efficiency indicator, to judge performance. ROE is therefore included in the current analysis together with other performance indicators.

Chukwunulu, Ezeabasili, and Igbodika (2019) used regression analysis to evaluate the impact of credit

risk on bank performance. They discovered that non-performing loans and profitability metrics (ROA and ROE) had a negative correlation, which led to a decline in profitability. Amenawo, Udoka, and James (2019) used data from the Central Bank of Nigeria from 1986 to 2017 using an exploratory approach to study the financial risk and performance of Nigerian SMEs. Financial risk and SME performance were revealed to have a negative but negligible long-term association using autoregressive distributed lag (ARDL) approaches. In the medium and long term, however, SMEs were significantly impacted negatively by currency rate, liquidity, interest rate, and inflation risks, suggesting that financial risks impair SME performance and have to be managed.

Methodology

The research design used in this study was ex post facto. All manufacturing companies listed on the Nigeria Exchange Group (NGX) between 2014 and 2024 make up the study's population. Since the majority of corporations' annual reports for the 2025 fiscal year had not yet been fully released at the time of the study's conduct, it was not possible to expand its scope to include 2025. The published yearly financial statements and accounts of the selected companies for the study period served as secondary sources of the data used in this investigation. Again, the period 2014–2025 was chosen because it marked the era of digital transformation.

Furthermore, two (2) risk management measures, liquidity and capital adequacy risks and one (1) financial performance measure were employed. The study obtained a sample of fifteen (15) industrial and consumer goods companies listed on Nigerian Exchange Group. Data obtained were analyzed via a combination of descriptive, regression diagnostic and inferential statistical tools. Given the dependent and independent variables of the study, the following empirical models were estimated:

$$FRP = F(LR, CAR)$$

$$FRP_{it} = a_0 + a_1 LR_{it} + a_2 CAR_{it} + \mu_t$$

Where: FRP_{it} Firm performance (measured as ROA which is profit after tax divided by total assets of firm i in year t); LR_{it} is liquidity risk (current ratio measured as current assets divided by current liabilities of firm i in year t); CAR_{it} is capital adequacy risk (measured by dividing the total capital of a bank by its risk-weighted assets of firm i in year t); μ_t is error term; it is firms at time t ; a_0, a_1, a_2 , is constant of coefficient.

Results

Table 1: Summary of Descriptive Statistics

Parameters	Mean Score	Std. Dev.	Minimum Score	Maximum Score	Skewness Score	Kurtosis Score
FRP	2.295	17.147	-179.91	176.26	-1.462	41.95
LR	-2.840	117.26	-3123.0	202.90	-25.89	688.7
CAR	45.488	37.956	0	376.4143	4.691	34.41

Source: Researcher's Computation (2025)

Important information on the data distribution and variability of the financial performance and risk management indicators among Nigerian manufacturing enterprises can be gained from the descriptive statistics of the variables utilised in this study. A low average level of performance is indicated by the financial performance (FRP) variable's mean of 2.295 while a large standard deviation of 17.147 suggests that there are significant differences amongst organisations. Significant variations are evident in the lowest and maximum values (-179.91 and 176.26, respectively), which are probably the result of outliers. Extreme values are confirmed by the exceptionally high kurtosis (41.95)

and negative skewness (-1.46), which show a left-skewed distribution with large tails.

With a mean of -2.84 and an exceptionally high standard deviation of 117.26, liquidity risk (LR) indicates a significant degree of volatility. A very asymmetric distribution with several extreme values is indicated by the extremely high kurtosis (688.7) and extreme negative skewness (-25.90), which may have a significant impact on model estimation and inference. With a comparatively high average of 45.49 and a standard deviation of 37.956, capital adequacy risk (CAR) exhibits significant variability. Numerous big values could affect the average since the distribution is leptokurtic (kurtosis of 34.41) and positively skewed (4.691).

Table 2: Pearson Correlation

Variable	FRP	LR	CAR
FRP	1.0000		
LR	-0.0233	1.0000	
CAR	-0.1253	-0.0116	1.0000

Source: Researcher's Computation (2025)

The study's variables' linear relationships are revealed by the correlation analysis. There is virtually no linear link between liquidity risk (LR) and financial success, as evidenced by the very weak negative correlation (-0.0233). Financial performance and capital adequacy risk (CAR) have a negative correlation (-0.1253), which is the largest negative association among the risk factors. This suggests that financial performance may be marginally lowered by

increasing capital adequacy risk. Additionally, it seems that there is little correlation between the independent variables. There is hardly any significant association between LR and CAR, as seen by their minor negative correlation (-0.0116). Since there is no high correlation (i.e., above 0.7 or below -0.7) between any two variables, these weak connections imply that multi-collinearity is not an issue.

Table 3: Variance Inflation Factor (VIF)

Variable	VIF	1/VIF
CAR	1.04	0.962154
LR	1.01	0.991265
Mean VIF	1.03	

Source: Researcher's Computation (2025)

According to the Variance Inflation Factor (VIF) results, multicollinearity is not an issue in this research. The VIF values for each variable are quite near to 1, with liquidity risk (LR) having the lowest value at 1.01 and the highest at 1.03. These results demonstrate that the independent variables, LR and CAR, are not substantially associated with each other, as VIF values below 10 (or, more conservatively, below 5) are often regarded as acceptable. This is further supported by the mean VIF of 1.03, which guarantees the stability and dependability of the

regression estimates and shows a very low degree of multicollinearity.

Table 4: Breusch Pagan Test**Breusch Pagan Cooke/Weisberg
Test for Heteroskedasticity**

Chi2(1) = 223.62; Prob>chi2= 0.0000

Source: Researcher's Computation (2025)

The findings of the Breusch-Pagan/Cook-Weisberg test for heteroskedasticity show that the regression model contains heteroskedasticity. The p-value of 0.0000, which is much below the traditional cut-off of 0.05, indicates that the test statistic ($\text{Chi}^2 = 223.62$) is very significant. This indicates that we accept the alternative that the variance of the residuals is not constant and reject the null hypothesis of homoskedasticity,

or constant variance of errors. Practically speaking, this breach of a fundamental OLS premise suggests that standard errors might be skewed, which could compromise the validity of confidence intervals and hypothesis testing. Robust standard errors or alternative estimators that are consistent with heteroskedasticity should be employed to address this.

Table 5: Panel-Corrected Standard Errors Regression

Period: 2014-2025				R-squared =		0.0902
				Wald chi2(1) =		25.62
				Prob > chi2 =		0.0000
Panel-corrected						
FRP	Coef.	Std. Err.	Z	P>z	[95% Conf.	Interval]
LR	0.3940	0.0997	7.37	0.000	0.1985	0.5894
CAR	0.3838	0.0484	6.57	0.000	0.1373	0.9380
cons	0.7625	0.1181	12.45	0.000	0.5309	0.9941

Source: Researcher's Computation (2025)

The findings of the Panel-Corrected Standard Errors (PCSE) regression for all of the panel data from 2014 to 2024 are shown in Table 5. The model implies that there is no serial correlation in mistakes over time within panels, hence the panel was first balanced without autocorrelation. Second, the panel is balanced and indicates that residuals may be associated across panels; corrections were made. The model comprises three (3) estimated coefficients: one for the constant (_cons) and one for FRP, LR, and CAR. The model essentially explains just 9% of the variance in the dependent variable, according to the R-squared of 0.0902 (poor explanatory power). However, the probability Chi2(1) is 0.0000 (low), which is less than 0.05%, showing that the entire model is statistically significant at conventional levels (e.g., 1% and 5%). The Wald Chi2(1) is 25.62, indicating the joint significance test of model coefficients. This indicates that the independent variable did a good job of explaining variance in the dependent variable.

Additionally, the estimated effect on the dependent variable (FRP) indicates that there is a correlation between an increase in FRP (the dependent variable) and a one-unit rise in LR and CAR (the independent variables). The effect is robust and significantly positive, as indicated by the statistical significance of the result ($p <$

0.000). The results of the panel-corrected standard errors regression showed that the degree of financial performance is considerably impacted by both capital adequacy risk (Z-score = 6.57; Probability = $0.000 < 0.05\%$) and liquidity risk (Z-score = 7.37; Probability = $0.000 < 0.05\%$). The inference is that financial performance is driven by effective risk management in relation to liquidity and capital adequacy issues, especially in the age of digital transformation.

Conclusion and Recommendations

Digital transformation has generally been accepted as a vital way of improving performance at the corporate and national levels. In the context of Nigeria's digital transformation, we investigated in this study if risk management influences the financial performance of publicly traded companies. Using an ex-post-facto research design, the digital transition era from 2014 to 2024 was examined. One (1) financial performance metric and two (2) risk management strategies - liquidity and capital adequacy risks were used. Fifteen consumer and industrial goods businesses listed on the Nigerian Exchange Group Limited were selected for the study. A combination of descriptive, regression diagnostic, and inferential statistical tools were used to analyse the collected data. The panel-corrected standard errors regression

result demonstrated that liquidity risk and capital adequacy risk greatly affect the level of financial performance.

The finding implies that financial performance is driven by efficient risk management in relation to liquidity and capital adequacy, especially in the era of digital transformation. The study suggests, among other things, that in addition to traditional financial risks, management of publicly traded industrial and consumer goods companies should think about integrating more comprehensive and sector-specific risk management systems, such as supply chain, operational, and foreign exchange risks. In the risk management frameworks of Nigerian listed industrial and consumer products companies, there is also an urgent demand for a more inclusive digital systems. This study advances knowledge because it offers a more critical evaluation of the risk-performance relationship of industrial and consumer goods companies in the age of digital transformation.

Social Inequalities and Urban Development in Nigeria: Examining the Role of Inclusive Planning in Achieving Sustainable Cities

OTEGA, Okinono

Department of Sociology and Criminology Studies,
University of Delta, Agbor, Nigeria
otegaokinono@gmail.com

Publication Date: 2025/11/28

Abstract

Nigeria's rapid urbanisation has intensified inequalities, with class, gender, and community disparities shaping access to land, housing, infrastructure, and governance. Lagos, as a rapidly expanding megacity, reflects these dynamics, where urban planning often privileges elite interests while marginalising vulnerable populations. This study examines how inclusive planning can address such disparities in pursuit of Sustainable Development Goal 11. Adopting a phenomenological research design, 15 purposively selected participants, urban planners, government officials, community leaders, NGOs, and residents of informal settlements, were engaged through semi-structured interviews. Data were analysed thematically to capture the lived experiences and perceptions of diverse stakeholders. The results highlight entrenched exclusions in planning, elite capture of urban resources, and tokenistic participation of marginalised groups. Women face particular disadvantages in tenure, mobility, and representation. Nonetheless, opportunities exist through participatory governance, pro-poor housing policies, and gender-responsive infrastructure to promote inclusive growth. Urban development in Lagos is shaped by systemic inequalities but holds transformative potential if planning is reframed as participatory, justice-oriented, and equity-driven. Inclusive planning emerges as a key pathway towards achieving sustainable and socially just cities. Policy reforms should prioritise community representation, integrate gender-sensitive approaches, strengthen institutional accountability, and embed inclusivity benchmarks in urban planning frameworks.

Keywords: *Social Inequalities, Urban Development, Inclusive Planning, Sustainable Cities, Nigeria*

Introduction

Urbanisation is rapidly transforming societies worldwide, with Nigeria experiencing one of the fastest urban growth rates in Africa. Between 2010 and 2019, Nigerian cities recorded an annual growth of over 4 percent, significantly above the global average (UN-Habitat, 2018; Jiboye, 2011). While this trend presents economic opportunities, it has also intensified challenges such as inadequate housing, overstretched infrastructure, and the proliferation of informal settlements, where nearly 69 percent of Nigeria's urban population reside without access to basic services (UN-Habitat, 2018). These dynamics underscore the urgency of embedding inclusivity within planning processes to achieve sustainable urban futures.

Social inequalities, along lines of class, gender, and community, play a central role in shaping urban development patterns. Planning regimes often favour elites through exclusionary zoning and land allocation practices, thereby deepening spatial segregation (Olaniyan, 2022). Women and other marginalised groups face barriers in housing, mobility, and participation in decision-making,

limiting their access to urban benefits (African Cities Research Consortium, 2022). Informal communities, while offering proximity to economic opportunities, remain structurally excluded and vulnerable (Anierobi, Nwalusi, Efobi, Nwosu, Nwokolo, & Ibem, 2023). These dynamics stand in contrast to Sustainable Development Goal 11 (SDG 11), which advocates for inclusive, safe, resilient, and sustainable cities (United Nations, 2015).

Despite policies such as the National Urban Development Policy, social and spatial inequalities persist due to weak implementation, elite capture, and limited stakeholder engagement (Jegede et al., 2019; Easterly, 2009). The tension between rapid urbanisation and the goals of inclusive, sustainable development creates significant risks for social cohesion and long-term resilience in Nigerian cities.

This study therefore examines how class, gender, and community disparities shape urban growth, assesses the inclusivity of existing planning practices, and analyses policies that seek to promote sustainable development. The objectives are fourfold: (1) to examine how class, gender, and community disparities influence urban development; (2) to assess

the extent to which existing urban planning processes are inclusive; (3) to analyse policies and frameworks that promote inclusive planning for sustainable cities; and (4) to recommend strategies for integrating equity and inclusion into Nigerian urban development.

By foregrounding these issues, the study contributes to sociological debates on inequality and urbanisation, provides evidence-based insights for policymakers and urban planners, and amplifies the voices of marginalised communities in the pursuit of sustainable urban futures.

Social Inequalities

Social inequalities are central to the understanding of urban development processes, as they shape how cities evolve and whose needs are prioritised. In most contexts, inequalities are structured along the intersecting axes of class, gender, and community identity. Class divisions significantly influence access to land, housing, and essential amenities. Affluent groups are typically able to secure residence in prime, serviced neighbourhoods, benefitting from reliable infrastructure and better-quality schools, healthcare, and transport facilities. In contrast, lower-income households are often relegated to marginal or peripheral areas, including informal settlements, where access to water, sanitation, and secure tenure is precarious (Lens, 2022). Such spatial divisions not only reproduce economic inequality but also deepen social exclusion by limiting upward mobility and reinforcing urban poverty cycles.

Gender inequalities intersect with class to further complicate patterns of access to the city. Women frequently encounter barriers in securing land ownership or tenancy rights due to cultural norms, discriminatory inheritance systems, and unequal income distribution (Chant & McIlwaine, 2016). Additionally, women's urban experiences are shaped by disproportionate care responsibilities and vulnerabilities linked to safety in public spaces. Limited access to affordable and safe transport, for example, constrains women's economic participation and mobility in Nigerian cities (Lamidi & Akinyemi, 2021). These structural disadvantages highlight the gendered nature of urban development, whereby planning frameworks that are not consciously inclusive risk reproducing male-centred priorities while silencing women's needs and contributions.

Community-level inequalities, including those based on ethnicity, religion, or migrant status, also influence access to urban opportunities. Migrants and minority ethnic groups may find themselves excluded from formal planning processes, denied political voice, or stigmatised in settlement upgrading schemes (Anierobi, Nwalusi, Efobi, Nwosu, Nwokolo, & Ibem, 2023). In contexts where patronage networks dominate urban governance, access to resources such as land allocations or government housing often depends on affiliation with

political elites or dominant social groups. Such practices exacerbate horizontal inequalities and undermine social cohesion by fostering resentment and marginalisation (Stewart, 2010).

Taken together, these forms of inequality generate differentiated experiences of the city. They determine who benefits from infrastructural investment, who is pushed into hazardous or underserved environments, and who has the political capital to influence planning decisions. As Lavell et al. (2023) argue, inequality not only undermines the fairness of urban growth but also compromises its sustainability, as excluded groups are denied the capacity to contribute to and benefit from development. In the Nigerian context, persistent inequality across class, gender, and community lines has contributed to spatial fragmentation, deepening the divide between elite enclaves and impoverished informal settlements. Addressing these inequalities is therefore critical if urban planning is to become a genuinely inclusive process that aligns with the objectives of Sustainable Development Goal 11 on sustainable cities and communities.

Urban Development in Nigeria

Urban development in Nigeria is marked by rapid growth, infrastructural strain, and socio-spatial fragmentation. With an estimated urbanisation rate of over 4 percent annually, Nigerian cities such as Lagos, Abuja, and Port Harcourt are expanding at one of the fastest rates in the world (UN-Habitat, 2018). While urbanisation offers opportunities for economic growth, it has also produced significant challenges, including inadequate housing, traffic congestion, poor waste management, and overstretched infrastructure (Jiboye, 2011). 2024). The inability of formal planning systems to keep pace with population growth has created a widening gap between planned urban zones and unregulated informal settlements.

Historically, Nigerian urban planning has been influenced by colonial legacies, which emphasised spatial segregation and elite-centric development (Mabogunje, 2011). This legacy persists, with masterplans often prioritising central business districts, gated estates, and industrial corridors, while neglecting low-income neighbourhoods. Such disparities have entrenched socio-economic inequalities in cities, with wealthy groups enjoying reliable services and connectivity while poorer households endure overcrowded housing, poor sanitation, and insecure tenure (Agbola & Agunbiade, 2009). The uneven distribution of services not only reflects inequality but actively reproduces it, locking disadvantaged communities into cycles of poverty and exclusion.

Informal Settlements

Informal settlements represent a defining feature of urban Nigeria, with estimates suggesting that up to 65 percent of Lagos residents live in slums or unplanned communities (World Bank, 2020). These settlements emerge as adaptive responses to the housing and affordability crisis, providing shelter and access to economic opportunities for low-income populations excluded from formal housing markets (Anierobi, Nwalusi, Efobi, Nwosu, Nwokolo, & Ibem, 2023). While informal settlements demonstrate resilience and social organisation, they also face chronic vulnerabilities: lack of basic services, exposure to flooding and pollution, and the constant threat of forced evictions by state authorities.

Policies towards informal settlements have often been adversarial, treating slums as nuisances to be demolished rather than communities to be integrated into the urban fabric. This has led to repeated cycles of eviction in areas such as Lagos' waterfront settlements, displacing thousands of residents without providing alternatives (Justice & Human Dignity, 2017). However, more inclusive approaches, such as participatory slum upgrading and incremental housing, recognise informal settlements as legitimate parts of the city that should be improved rather than eradicated (UN-Habitat, 2015). Such approaches not only improve living conditions but also foster social inclusion, strengthening the resilience of cities against poverty and environmental risks.

Inclusive Planning

Inclusive planning refers to urban governance practices that actively involve diverse stakeholders, especially marginalised groups, in decision-making, while ensuring that urban resources and opportunities are equitably distributed. It goes beyond tokenistic consultation to empower citizens with meaningful influence over planning processes. Arnstein's (1969) seminal "ladder of citizen participation" highlights that genuine inclusion requires shifts in power dynamics, allowing marginalised groups not merely to be informed but to share control over decisions.

In the Nigerian context, urban planning has often been criticised for its top-down, technocratic nature, which favours elites and developers over ordinary residents (Agbola & Wahab, 2011). Participatory initiatives have been introduced, but many remain symbolic, lacking mechanisms to translate citizen input into enforceable policy (Eriksson, 2022). True inclusivity demands institutional reforms, such as transparent budgeting, legal protections for tenure security, and gender-sensitive planning that structurally embed equity into the governance system. Without such reforms, participation risks being reduced to consultation exercises with little impact on urban outcomes.

Sustainable Cities

The concept of sustainable cities, central to Sustainable Development Goal 11, integrates economic viability, social inclusion, and environmental resilience. A sustainable city is one that provides equitable access to housing, transport, public services, and green spaces, while reducing carbon emissions and mitigating environmental risks (United Nations, 2015). In practice, however, the sustainability discourse often prioritises environmental and economic dimensions, with social justice and inclusion treated as secondary concerns. This imbalance risks creating "green cities for the wealthy," where sustainability benefits are concentrated in affluent areas, leaving disadvantaged groups behind (Lavell et al., 2023).

For Nigerian cities, sustainability cannot be achieved without addressing entrenched inequality and spatial injustice. Environmental risks such as flooding, air pollution, and poor waste management disproportionately affect informal settlements, where residents have the least capacity to adapt. Similarly, the absence of inclusive transport and affordable housing exacerbates inequality and undermines resilience. Achieving sustainable Nigerian cities therefore requires placing equity at the centre of policy, ensuring that environmental and infrastructural initiatives are explicitly designed to benefit all social groups, particularly the most vulnerable.

Policy and Governance Frameworks

Policy and governance frameworks provide the institutional scaffolding through which urban planning is enacted. In Nigeria, zoning laws, land-use regulations, and fiscal allocations profoundly influence whose interests are served in urban development. However, these frameworks are often undermined by weak enforcement, bureaucratic inefficiency, and elite capture (Lens, 2022). For example, while masterplans may prescribe equitable land-use distribution, in practice, powerful developers and political elites often manipulate allocations to favour commercial and luxury developments, displacing low-income communities in the process (Mabogunje, 2011).

Effective governance requires mechanisms that enhance transparency, accountability, and inclusivity. Evidence shows that where policies promote secure tenure, community-based upgrading, and equitable service provision, cities make significant progress towards reducing inequality (UN-Habitat, 2018). Strengthening local governments' capacity, decentralising resources, and fostering partnerships between public agencies, private actors, and civil society are therefore critical to achieving inclusive and sustainable urban development. Governance reforms that redistribute both decision-making power and material resources remain central to closing the

gap between policy aspirations and lived urban realities.

Methodology

This study employs a qualitative phenomenological design to capture the lived experiences of stakeholders involved in urban planning and inequality in Lagos. Phenomenology is well-suited for exploring meanings and perspectives as constructed by participants (Smith, Flowers & Larkin, 2009; Gill, 2020).

Lagos was selected as the study area because it exemplifies rapid urbanisation and socio-spatial inequality. With over 20 million residents, the city faces challenges of informal settlement growth, infrastructural strain and exclusionary planning, making it an ideal context for interrogating inclusive planning (UN-Habitat, 2018; Koko et al., 2021).

The study population comprised urban stakeholders. A purposive sample of 15 participants was drawn, including three each from urban planners, government officials, community leaders, NGOs and residents in informal settlements. This strategy ensured diversity of perspectives while maintaining depth. A sample of this size is adequate for phenomenological studies, where thematic saturation rather than statistical generalisation guides sampling (Guest, Bunce & Johnson, 2006; Malterud, Siersma & Guassora, 2016).

Data were collected through semi-structured interviews, which allow comparability across cases while leaving space for participants to elaborate on their experiences (Kallio et al., 2016). The interview guide covered perceptions of inequality in urban development, inclusivity in planning processes, and strategies for reform. Interviews were audio-recorded with consent, transcribed verbatim and supplemented with field notes.

Analysis followed Braun and Clarke's (2006) six-phase thematic approach: familiarisation with the data, coding, theme development, review, naming and reporting. Themes were generated inductively to reflect participants' lived experiences, but also informed by existing literature on inequality and inclusive planning. To strengthen trustworthiness, coding consistency was checked across transcripts and reflexive memos were maintained (Braun, Clarke & Hayfield, 2019).

Ethical considerations guided the study. Informed consent was obtained from all participants, who were assured of confidentiality and anonymity. Given the vulnerability of residents in informal settlements, pseudonyms were used and sensitive data were de-identified. The study followed BERA's (2018) ethical guidance, ensuring voluntary participation and safeguarding marginalised voices.

Findings and analysis

Demographic Profile of Participants

Table 1

Profile of Key Informants

Code Name	Stakeholder Group	Gender	Age Range	Role/Position	Years of Experience
UBP1	Urban Planner	Male	45–54	Senior Town Planner	20+
UBP2	Urban Planner	Female	35–44	Physical Development Consultant	12
UBP3	Urban Planner	Male	25–34	Junior Planner, Local Council	5
GO4	Government Official	Male	45–54	Director, Urban Development	18
GO5	Government Official	Female	35–44	Senior Officer, Housing Policy	14
GO6	Government Official	Male	55–64	Permanent Secretary	28
CL7	Community Leader	Male	55–64	Chair, Informal Settlement Committee	25
CL8	Community Leader	Female	45–54	Women's Association Leader	22
CL9	Community Leader	Male	35–44	Youth Mobiliser, Slum Dwellers Federation	15
NGO10	NGO Representative	Female	25–34	Programme Officer, Housing Rights NGO	8
NGO11	NGO Representative	Male	35–44	Director, Urban Inclusion Advocacy Network	13
NGO12	NGO Representative	Female	45–54	Policy Advisor, International Development NGO	20
RIS13	Resident (Informal)	Female	25–34	Trader, Makoko Settlement	8
RIS14	Resident (Informal)	Male	35–44	Fisherman, Ijora Waterfront	12
RIS15	Resident (Informal)	Female	45–54	Seamstress, Ajegunle	25

Findings based on Research Objectives

Theme 1: Social Inequalities Shaping Urban Development

Urban development is never a neutral process; it reflects and often reproduces existing social inequalities. In rapidly urbanising contexts such as Nigeria, disparities along class, gender, and community lines strongly influence who benefits from growth and who is excluded. Class-based

inequalities manifest in unequal access to land, housing, and infrastructure, where affluent groups dominate serviced neighbourhoods while poorer households are relegated to informal settlements with limited amenities (Rodríguez-Pose, & Storper, 2020). Gender further shapes these dynamics, as women

face barriers in mobility, tenure rights, and safety in public spaces, reinforcing their marginalisation within urban economies (Huedo, Florez-Perez, & Agost-Felip, 2021). Community-level inequalities, including those linked to ethnicity, migration status, or social networks, often determine whose voices are heard in planning processes and whose claims to the city are denied (Awoonor, 2025).

Such inequalities not only affect everyday access to opportunities but also influence the direction of

planning policies and infrastructural investments, frequently prioritising elite or politically connected groups. The result is fragmented urban growth marked by exclusion and vulnerability for marginalised populations. Understanding how social inequalities shape urban development is therefore critical to promoting inclusive planning and achieving the Sustainable Development Goal 11 of creating safe, inclusive, and sustainable cities.

Figure 1. Social Inequalities Shaping Urban Development

Class-Based Inequalities in Housing and Services

The findings reveal entrenched class disparities in access to land, housing, and services in Lagos. Urban planners and residents alike highlighted the elite capture of prime land allocations, with low-income households relegated to marginal spaces. As UBP1 explained, “prime land allocations in Lagos are almost always dominated by political elites or high-income groups. Lower-income families are rarely considered in master plans, except as afterthoughts.” Residents of informal settlements echoed the displacement. RIS14 lamented: “We are always the ones relocated without alternatives; we survive in places with no water or electricity.” This supports UN-Habitat (2022), which notes that forced evictions and lack of resettlement options exacerbate urban poverty in African cities.

These findings highlight Kipfer, Saberi, and Wieditz (2013) “right to the city” framework, illustrating how class inequalities determine who benefits from urban development. Elite control of resources undermines inclusive city-making, contradicting SDG 11’s call for “inclusive, safe, resilient and sustainable cities.”

Gendered Urban Experiences

Women reported limited access to housing, mobility, and public spaces due to cultural norms and safety concerns. UBP2 stated: “*Women face huge mobility barriers, lack of safe, affordable transport means many cannot access economic opportunities in the city centre.*” Similarly, RIS13 observed: “*As a*

woman I cannot claim land here without a man’s support; landlords do not take us seriously.”

These insights align with Chant and McIlwaine (2016), who demonstrate that urbanisation without gender-sensitive planning reproduces inequalities. The gendered dimensions of exclusion highlight the need for feminist approaches to urban planning, which challenge male-dominated structures and call for equitable access to space and services.

Community-Level Inequalities

Community leaders stressed the exclusion of ethnic minorities and migrant groups. CL9 explained: “*Migrant groups are denied rights to settle; they are labelled illegal even after decades.*” This corresponds with Omoegun (2025) who documented the marginalisation of migrant communities in Lagos, often denied political voice or tenure rights.

The findings underscore how identity-based exclusion intersects with class and gender, producing multiple layers of inequality in urban development.

Theme 2: Inclusivity in Urban Planning Processes

Urban planning processes are central to determining how resources, services, and opportunities are distributed across cities. However, in many developing contexts, including Nigeria, planning has often been characterised by exclusionary practices that privilege political and economic elites while marginalised communities remain overlooked

(Watson, 2014). Participation mechanisms, when present, are frequently tokenistic, providing limited avenues for meaningful community influence. This lack of inclusivity exacerbates spatial inequalities, leading to the proliferation of informal settlements, inadequate infrastructure, and poor service delivery. Inclusive planning, by contrast, ensures that diverse voices, particularly those of women, low-income groups, and ethnic minorities, are integrated into

decision-making, thereby fostering equity and accountability (Anierobi, Nwalusi, Efobi, Nwosu, Nwokolo, & Ibem, 2023). Globally, frameworks such as the Sustainable Development Goal 11 emphasise the importance of participatory governance in achieving sustainable cities. Embedding inclusivity in planning is therefore essential not only for social justice but also for building resilient, liveable urban futures.

Figure 2. Inclusivity in Urban Planning Processes

Exclusion from Planning

Across groups, participants described planning as tokenistic. GO5 admitted: *"Public hearings are often symbolic; communities have little real influence on the outcome."* Residents confirmed this, with RIS15 stating: *"We cannot attend because transport costs are high, and even when we do, we are ignored."* These findings mirror Watson (2014), who argues that African urban planning remains state-centred and exclusionary. Exclusion from planning perpetuates inequalities and undermines the participatory ideals enshrined in Nigeria's National Urban Development Policy (2012).

Elite Capture of Decision-Making

Participants highlighted political dominance over planning. UBP3 noted: *"Planning decisions are heavily influenced by politics, not technical expertise."* This echoes Acey (2007), who found that political elites in Lagos exert disproportionate influence over land-use decisions, often to the detriment of poor residents. These findings reaffirm the argument that urban planning in Nigeria is not merely technical but deeply political.

Theme 3: Policies and Frameworks for Inclusive Planning

Inclusive planning has emerged as a central approach in addressing the social and spatial inequalities

produced by rapid urbanisation. Policies and frameworks at both global and national levels emphasise participation, equity, and sustainability as guiding principles for urban growth. The United Nations' Sustainable Development Goal 11 explicitly calls for "inclusive, safe, resilient, and sustainable cities," providing a global benchmark for governments (UN-Habitat, 2022). In Nigeria, instruments such as the National Urban Development Policy and Lagos State Urban Renewal programmes have sought to embed inclusivity, though implementation remains uneven and often undermined by political interference (Anierobi, et.,al, 2023). Effective frameworks require more than policy declarations; they depend on mechanisms that ensure marginalised voices are represented in decision-making and that equity indicators are systematically monitored. Thus, the study of policies and frameworks for inclusive planning is essential to evaluating whether urban governance can move beyond rhetoric towards truly sustainable and equitable city development.

Existing Policies and Gaps

Although Lagos has frameworks such as the Lagos Urban Renewal Policy, participants expressed doubts about their effectiveness. NGO11 explained: *"We have progressive housing policies on paper, but implementation is weak and inconsistent."*

This finding resonates with Acey (2007), who found that weak institutional capacity limits policy effectiveness in Nigerian cities. NGO12 further noted: *“Current frameworks pay lip service to inclusivity, but the SDG 11 mandate is not truly integrated into practice.”* Policy frameworks exist, but weak implementation and poor alignment with global agendas limit their transformative potential.

Theme 4: Strategies for Inclusive and Sustainable Urban Development

The pursuit of inclusive and sustainable urban development has become central to global and national policy agendas, particularly under the Sustainable Development Goal 11 which advocates for cities that are “inclusive, safe, resilient, and sustainable.” In contexts such as Nigeria, where rapid urbanisation is accompanied by deepening inequality, the formulation of strategies that prioritise equity is vital. Inclusive planning requires the active participation of diverse stakeholders, including marginalised communities, women, and informal settlement residents, ensuring that their needs and aspirations shape urban outcomes (Mitlin & Bartlett, 2018). Pro-poor housing schemes, gender-responsive infrastructure, and participatory governance mechanisms are recognised as effective approaches for redressing exclusion (Pieterse, 2018; UN-Habitat, 2022). Beyond participation, institutional reforms that reduce elite dominance and strengthen accountability structures are necessary for sustainable implementation. Ultimately, strategies for inclusive urban development must balance social justice with environmental and economic sustainability, enabling cities like Lagos to grow equitably while safeguarding resilience for future generations.

Figure 3. Strategies for Inclusive and Sustainable Urban Development

Community Participation and Empowerment

Community leaders and residents emphasised grassroots involvement. CL8 stated: *“Planning must begin with us, not after decisions have been taken. We know the real issues.”* Similarly, RIS13 remarked: *“If government came to sit with us, solutions would be better for everyone.”* This echoes Mitlin and Bartlett (2018), who argue that genuine community participation is essential for inclusive urban transformation.

Institutional Reforms

Stakeholders called for institutional reforms to address gender and equity concerns. UBP2 proposed: *“Gender mainstreaming must be built into planning frameworks, not as an afterthought.”* NGO11 added: *“Inclusive planning requires mechanisms to monitor government promises.”* These perspectives support the argument of Pieterse (2018) that participatory governance and institutional reforms are crucial for equitable urban futures in Africa.

Conclusion

The findings of this study underscore the profound influence of social inequalities, particularly those based on class, gender, and community, on patterns of urban development in Lagos. While policies and frameworks for urban renewal exist, their weak implementation, coupled with elite capture of planning processes, perpetuates exclusion and marginalisation. The persistence of tokenistic participation highlights a structural gap between policy rhetoric and lived urban realities. Yet, opportunities exist for inclusive and sustainable transformation if urban governance adopts equity-driven and participatory approaches.

Recommendations

1. Strengthen Inclusive and Participatory Planning: Establish community forums and neighbourhood councils that feed directly into metropolitan planning boards, ensuring residents of informal settlements have genuine representation. Translate planning documents into local languages and hold consultations at accessible times and venues to remove structural barriers to participation.
2. Promote Gender-Responsive Urban Development: Mainstream gender-sensitive approaches into all planning processes, including safety audits of public spaces, gender quotas in planning committees, and allocation of land/housing to women. Improve women’s mobility by expanding safe and affordable public transport networks, especially linking informal settlements to city centres.
3. Enhance Policy Implementation and Accountability: Strengthen institutional capacity for monitoring and evaluating urban development projects, with independent oversight bodies to track inclusivity and sustainability indicators. Align local policies with the SDG 11 mandate by developing measurable benchmarks for inclusivity and sustainable development in Lagos.

Sociological Marketing Factors and Consumer Buying Behaviour of Departmental Stores in South-South, Nigeria

EDEME, Nelson Chidi

Department of Marketing and Entrepreneurship,
Faculty of Management Sciences,
Delta State University Abraka, Nigeria
nelvas14@yahoo.com

Publication Date: 2025/11/28

Abstract

This study focused on sociological marketing factors and consumer buying behaviour of Departmental Stores in South-South, Nigeria. The specific objectives were to; determine the effect of social product, Social price and social promotion on consumer buying behaviour of Departmental Stores in South-South Nigeria. Several literatures were reviewed and cited in this study for better understanding. This study adopted cross sectional survey research design method: The data collected from the respondents through the use of closed ended questionnaire were presented and analyzed using simple descriptive statistics such as frequency distribution tables, percentages and arithmetic mean score. The mean cut-off point of 2.50 bench mark was adopted to determine acceptance and rejection of each item in the questionnaire. The hypotheses were tested with t-test statistical techniques. The findings revealed that, there is a significance relationship between sociological marketing factors and consumer buying behaviour of Department stores in South-South, Nigeria. It was concluded that to compete in the highly competitive business environment, managers of Departmental Stores need to concentrate their e-marketing approach by enhancing customer's trust to stimulate the buying behaviour of customers. The study recommended that, it is pertinent for managers to understand changing consumer needs, wants, and motivations and thereby devise the most appropriate mix for his market. Then, to the marketer the dynamic nature of consumer behavior implies rapid product development, changing communications, and distribution strategies in order to be more effective. While some outcomes may be significant to marketing practice the overall goal of such research endeavor is to achieve better understanding of consumer behaviour

Key Words: Sociological Marketing, Consumer Buying Behaviour, Social Product, Social Price, Social Promotion and Departmental Stores

Introduction

The Nigerian retail industry has developed significantly over the years, changing gradually from traditional to more modern systems; such that from buying and selling at open air markets in both urban and rural areas, Nigerians are increasingly patronizing convenience stores, supermarkets and online shops (Philips Consulting Limited, 2024). Since the introduction of the concept of social class into the marketing literature, it has been an interesting aspect of study for marketing scholars and practitioners (Mihic & Culina, 2022). The decision consumers make with respect to acquisition of products is of special interest, especially as it relates to the social class category to which a person belongs. It is very important to note that social class as a context is rooted both in an individual's substance of social life such as wealth, education, work and also individuals'

material resources as well as perceptions of rank in relation to others in society, with a proportionate influence on behaviour (Kraus, Piff, & Mendoza-Denton, 2022).

Sociological marketing cannot be successful if it ends when it develops a product that has the right target audience and with the notion of selling at the appropriate price (Global Research Society, 2021). The products must be distributed to the right place where the target audience can locate them with ease through the right channel and at the appropriate time. Social place is critical since it impacts the organization's sales turnover and profit margins. An organization can lose its competitive advantage and customers due to delayed delivery. The effectiveness of an organization depends greatly on the management of its distribution strategy effectiveness to move its final products to the final

users because a product, no matter how good it may be if it did not leave the factory, is of no benefit to both the producer and the consumers. For this reason, the adoption of supply chain management to cut costs, increase market share and sales, and establish solid customer relations are increasing rapidly (Ferguson, 2020).

The core purpose of this study is to study the impact of different sociological marketing factors on consumer buying behaviour. Hence, the Research on sociological marketing factors is certainly vital to recognize the most influencing tools to compete with its competitors. The purpose of research is to study closely the fondness of customers on a variety of sociological marketing factors. With the help of this information, the marketer and retailers could well plan their resources to get the highest profit. This research aims to examine the partiality of consumer on different sociological marketing factors, marketers and retailers will be able to be conscious of the consumer buying behaviour, so that they can make use of the right and the most successful sociological marketing factors to catch the attention of the customer.

Statement of the Problem

During the previous few decades, doing business has been highly competitive globally including departmental stores in Nigeria; the customers have a great deal of diverse selections and options to decide on. Customers play an important role as they are the ones who are directly involved in the final buying of products or services. Majority of customers today are more informed, more knowledgeable, more demanding, more perceptive than ever before. In Nigerian retail sector, for example, companies thus have forced to find their consumer's needs and wants by learning and understanding their consumer behaviour in order to make them buy so as to earn revenue and to survive in the market. As a result, the understanding of consumer behaviour is vital to succeed in the business. The better the company understands the consumer's behaviour, the more sales it can generate. In contrast, vague understanding of consumer habit makes the company hardly compete with other rivals and this occurrence might force company to withdraw from the market.

The consumer buying process reveals a series of stages that individuals undergo as they make purchase decisions. From the very first stage of identifying a problem i.e. an existing need, to the point of evaluating alternatives, psychological influences are evident; however, the stage where customers initiate a purchase action captures the consumer's actual behaviour, which is definitely a function of the preceding phases. Consumer's behaviour which involves how they acquire products reveals very striking differences with respect to shopping styles and purchase patterns

existing among different consumer categories. The existence of sociological marketing factors raises issues as to whether all consumers shop alike in reality. In actual fact, different shopping styles exist; and consumer decision making is not only concerned about product and brand features but also on other criteria such as choice of departmental outlets in South-South Nigeria.

The truism of this opinion is what this study is set out to investigate. It is therefore, based on this premise that this study seeks to investigate critically into sociological marketing factors and consumer buying behaviour of departmental stores in South-South Nigeria. Specifically, with the existence of different shopping options available to the present Nigerian consumers such as online shopping, instore shopping (departmental stores, multiple chain stores, convenience stores), open-air markets, roadside kiosks and shops; this study seeks to critically examine the various shopping styles, organizations and patterns among different consumer categories in a bid to discover the influence of sociological peculiarities on their choices

Objectives of the Study

The focus of this study is to examine the effect of sociological marketing factors on consumer buying behaviour of departmental stores in South-South Nigeria. The specific objectives are to:

- i. determine the effect of social product on consumer buying behaviour of departmental stores in South-South Nigeria
- ii. evaluate the impact of social price on consumer buying behaviour of departmental stores in South-South Nigeria
- iii. examine the effect of social promotion on consumer buying behaviour of departmental stores in South-South Nigeria

Review of Related Literature

Social Marketing Factors

The societal marketing concept emerged in the 1970s and has since overlapped with the marketing philosophy. The concept assumes that there is a conflict between consumer short-term wants and society's long-run interest and that organizations should focus on a practice that ensures long run consumer and societal welfare. Kotler and Armstrong (2010) consider the societal marketing orientation to be the best business philosophy for organizations. They said that community marketing: "represents a new concept and an attempt to align business goals with sometimes conflicting goals of society". They conclude: the organization's task is to determine the needs, wants and interest of target markets and to deliver the desired satisfactions more effectively and efficiently than

competitors in a way that preserves or enhances the consumer's and society's well-being". It is understandable why this concept did not emerge until around the 1970s.

The appropriateness of societal marketing philosophy is deduced from the fact that it supports the socially responsible behaviour of the organization. It thus challenges the earlier assertion that "the social responsibility of business is to make a profit". Organizations will still need to adopt this business philosophy to be able to deal with the cultural and regulatory aspects of the business environment. This means adoption of the societal marketing philosophy generates some factors of market orientation that foster business performance. The societal marketing concept is considered a separate business philosophy; however, the concept could be better looked at as complimentary. It should be complementary business thinking to the adoption of other business philosophies, particularly, the marketing philosophy (Andrianova & Yeletskikh, 2022). Thus, whether a business is production, product, selling, or marketing oriented, the interest of the society must still be given its rightful place because society is a key stakeholder in every business. Multiple studies have found that social marketing approaches can effectively change social norms and behaviour.

Social Product

It is essential to have a clear description of the product in a social marketing campaign, at the core, actual, and augmented levels. A core product comprises the benefits that the target audience will experience or expect in exchange for performing the targeted behaviour, or that will be highlighted in a social marketing campaign (e.g., healthier life and the reduction in the risk of becoming obese or overweight). An actual product is the desired behaviour, often embodied by its major features and described in specific terms (such as healthy foods or beverages available at vending machines). An augmented product refers to any additional tangible objects and/or services that will be included in the offer and promoted to the target market. An augmented product helps perform the targeted behaviour or increase its appeal (e.g., information on healthy products available in vending machines) (Gordon, 2022). The most important aspect of the marketing mix is the offer or the product. Social marketers seek to influence the behaviour (actual product) of a specific priority population or target audience by offering them a bundle of benefits (core product) while minimizing associated costs-the personal or monetary things that must be exchanged or given up in pursuit of the desired behaviour. It is critical to understand the consumer's wants, desires, aspirations, and needs and not merely their behaviours, attitudes, and knowledge (SheauTing, Mohammed &

Weng-Wai, 2023). To have a viable product, people must first perceive that they have a genuine problem and that the product offering is a good solution for that problem. The role of research here is to discover the consumers' perceptions of the problem and the product and to determine how important they feel it is to take action against the problem.

Social Price

Social price sums up the costs that the target audience will "pay" for adopting the desired behaviour that leads to the promised benefits. These costs could be monetary in the real sense, such as those for tangible goods and services. Most of the time, however, social marketers sell behaviours that require something else in exchange: time, effort, energy, psychological costs, and/or physical discomfort. A sensible price strategy is aimed at minimizing these costs by maximizing incentives (monetary and nonmonetary alike) to reward desired behaviours (again, monetary or nonmonetary) or to discourage competing, undesirable behaviours (Hamza, 2024).

Social Price refers to what the consumer must do to obtain the social marketing product. This cost may be monetary, or it may instead require the consumer to give up intangibles, such as time or effort, or to risk embarrassment and disapproval (Kotler et al., 20216). If the costs outweigh the benefits for an individual, the perceived value of the offering will be low and it will be unlikely to be adopted. However, if the benefits are perceived as greater than their costs, the chances of trial and adoption of the product are much greater. The price in social marketing campaigns usually involves inconvenience, risk, or lifestyle changes. To make the change more desirable, it is important to minimize the price that the target audience expects to pay. In a campaign to promote better nutrition, the price might be the expectation that the adopter must give up his favorite foods. Minimizing this price by teaching moderation rather than complete abstinence decreases the price and increases the chances of participation in change. Social marketers must balance these considerations, and often end up charging at least a nominal fee to increase perceptions of quality and to confer a sense of dignity to the transaction. These perceptions of costs and benefits can be determined through research and used in positioning the product (Menegaki, 2022).

Social Promotion

Social promotion consists of the integrated use of advertising, public relations, promotions, media advocacy, personal selling, and entertainment vehicles. The focus is on creating and sustaining demand for the product. Research is crucial to determine the most effective and efficient vehicles to reach the target

audience and increase demand. The primary research findings themselves can also be used to gain publicity for the program at media events and in news stories (Sheau-Ting et al., 2023). Information on product benefits and features, fair price, and easy accessibility need effective and efficient communications to bring to the target audience and inspire action. A promotion strategy is needed to maximize the success of the communications. The development of these communications is a process that begins with the determination of key messages, continues with the selection of messengers and communication formats and channels, moves on to the creation of communication elements, and ends up with the implementation of those communications. The determination of key messages needs to be aligned with marketing objectives because they determine what a social marketing campaign wants its target audience to know, to believe, and to do. Information on barriers, benefits, competitors, and influencers will help shape message choices. Messengers are those who deliver the messages. Credibility, expertise, and likability are some key considerations for selecting messengers. Messages are delivered through various communication channels (including media channels), such as advertising (including PSA), public relations, events, sponsorships, and personal selling, and word of mouth. As far as media channels are concerned, they can be online or offline, or both. Online media range from an e-mail, Web sites, and “smart” mobile phones to blogs, podcasts, and tweets, but by no means are limited to these options. Offline media include newspapers, magazines, radio, and television, as well as direct mail, billboards, transit (e.g., buses, taxis, and subways), and kiosks (Kotler et al., 2016). Because different communication channels have different characteristics, it could be more effective and efficient to have a good idea of the media budget and media options that a social marketing campaign could have before communication elements are created. Creative elements translate the content of intended, desired messages into specific communication elements, which include copy, graphic images, and typeface for traditional print media, and interactive features and audio and/or video streams for online media (Gordon, 2022).

Consumer Buying Behaviour

Consumer buying behaviour is the study of individuals and organizations and how they select and use products and services. It is mainly concerned with psychology, motivations, and behaviour. The study of consumer behaviour includes: how consumers think and feel about different alternatives (brands, products, services, and retailers), how consumers reason and select between different alternatives, the behaviour of

consumers while researching and shopping, how consumer behaviour is influenced by their environment (peers, culture, media), and how marketing campaigns can be adapted and improved to more effectively influence the consumer (Mothersbaugh & Hawkins, 2021). Consumer buying behaviour is the study of consumption. It aims to have a better understanding of consumer actions and processes used in their purchase decisions, as well as the usage of products and services and how they are disposed of. Exploring how the consumer's emotions, attitudes, and preferences affect buying behaviour, consumer behaviour draws upon ideas from several fields including psychology, sociology, anthropology, biology, marketing, and economics. Consumer behaviour plays an important role in marketing management. It provides information to the marketer based on which the marketer can design its marketing mix strategies and modify them in the future as per the situation. For the marketer, it is important to know how consumers will react to the marketing program to serve them effectively (Kotler & Armstrong, 2018). Modern marketing philosophies include identifying consumers' needs and satisfying them more effectively than the competitors. Thus modern marketing needs to understand consumer behaviour. The key to the company's survival, profitability, and growth in a highly competitive marketing environment is its ability to identify and satisfy consumers' unfulfilled needs better and sooner than the competitors. Thus, consumer behaviour helps in achieving marketing goals (Kim & Tang, 2020).

Theoretical Framework

This study is anchored on theory of reasoned action. The theory of reasoned action might have explained the influence of socio-economic factors on consumer behavior towards buying goods, a few other theories have taken a different perspective and opinion about different factors that could influence consumer behavior at a given period. The theory of buyer behavior according to Engel Kellet Blackwell believed that consumers' decisions to buy goods are based on some processes that work in four phases. The four phases according to the theory are the input, the processing information, decision stage and the variables stage. The theory argues that consumer behavior is influenced by the frequent marketing promotions that catch the consumer's attention at a given time such as online advertisements, billboards advertisement among others. Abraham Maslow's hierarchy of needs through motivation-need theory opined that consumers' behavior is fashioned after the need to satisfy and fulfil certain prioritized needs in their lives. The theory believes that an individual consumer will want to fulfil its physiological needs, ensuring more safety, love, esteem and the self-

actualization needs. In explaining the influence of socio-economic factors on consumer behavior toward purchasing products at a given period, the theory of reasoned action is relevant in these ways. The theory is helpful in explaining the processes that ensued when a consumer is faced with a challenge of making decision about a product. The theory also unveils the possibility of rationalization consumers pass through in their decision making producers, manufacturers, and marketers can always apply the theory in knowing the quantity of goods to be produced or promoted at a given time and the category of people.

Empirical Review

Imouokhome (2025), examined distribution strategies and consumer satisfaction in manufacturing firms; A Study of Unilorin Bakery. The study's objective is to determine the effect of selective distribution on customer satisfaction among students towards the University of Ilorin Bakery. The study used a survey research design. The study covered the students of the University of Ilorin, Ilorin, Kwara State; the population for the study was 49,153. Taro Yamane's method of determining sample size was used to arrive at 396 sample size. Simple linear regression was used in testing the hypotheses at a 0.05 significant level. The study's results show that selective distribution has a significant impact on customer satisfaction among students towards the University of Ilorin Bakery, with a significant level of 0.001, which is less than 0.05 alpha values. The study concluded that distribution strategies have a significant effect on customer satisfaction among students towards Unilorin Bakery. Therefore, the study recommended that Unilorin Bakery concentrate its efforts on brand promotion through a selective distribution strategy since it allows customers to make more informed purchasing decisions that can result in higher satisfaction with their choices and ultimately bring about customer satisfaction.

Suraj (2025), offered insights to both researchers and policymakers to address major societal issues through the lens of social marketing and consumer behavior research from the Web of Science relevant empirical evidence that may aid in planning interventions in the future. The publication, leveraging bibliometric analysis using R-Biblioshiny, examines research design parameters, techniques to gather data, means of analysis, visualization, and interpretation frameworks. Using Bradford and Lotka's laws as well as intellectual, social, and conceptual structure analyses, the study illustrates the significance of the previous literature in sharing impactful research. Results suggest that social marketing and consumer behavior research, which was originally developed in the USA, has gained traction internationally through increasing levels of collaboration and citation activity. Features covering

wellness, ecology, accident prevention, and community development show how the industry has the potential to address some important issues for society. This study identifies leading authors, publications, and gaps in the literature providing a roadmap for academics and practitioners alike on the direction of future research and policies, thus enhancing the understanding and use of social marketing and consumer behaviour.

Nwokinaka and Ofori (2024), examined the relationship between selective distribution strategy and customer satisfaction of soft drinks distributors in Rivers State. The objectives of the study were to determine the extent to which selective distribution strategy relate with customer satisfaction of soft drinks distributors in Rivers State. The study adopted cross-sectional research design. The population of the study was twenty (20) soft drink distributors in Rivers State as obtained from Nigeria Directory (2023). The researcher adopted a census study because of the small size of the study population, hence, there was no need for sampling. However, 3 managers were drawn from each of the twenty (20) soft drink distributors that constituted the study population. In all, sixty (60) managers constituted the respondents for the study. Data were collected through semi-structured questionnaire that was designed in the Likert 5-point scale of very low extent to very high extent. Data were analyzed using descriptive statistics of mean, standard deviation frequency distribution, and bar chart. Inferential statistics of Pearson Product Moment Correlation (PPMC) was used to test the six hypotheses. Similarly, multiple regression analysis was used in testing the combined effect of all dimensions on each measure of criterion variable and aided with the aid of the Statistical Package for Social Sciences (SPSS version 23.0). From the data analysis, it was revealed that, a selective distribution strategy has positive and significantly relationship with customer satisfaction of soft drink distributors in Rivers State. Based on these findings, the study concluded that there is a significant and positive relationship between selective distribution strategy and customer satisfaction. This result corroborated the findings of previous studies. Therefore, recommend that soft drinks distributors in Rivers State should stay tuned to selective distribution strategy in order to embrace cost efficient and high the levels of satisfaction.

Methodology

The study adopted a cross sectional research approach to establish effect of sociological marketing factors on consumer buying behaviour among departmental stores in South-South, Nigeria. The population of the study cut across selected Departmental Stores operating across various cities in South-South Nigeria. It encompassed a broad spectrum of SMEs, spanning

diverse industries, including retail, services, and manufacturing. From the population of one hundred and twenty seven (127) members and a workable sample of ninety six (96) members is derived using the sample size determination formula cited in Taro Yamani's book (1993). The adoption of stratified random sampling technique involved the selected departmental stores with relevant experience and insights into the impact of sociological marketing factors on consumer buying behaviour. The data using a five point Likert Scaled questionnaire closed ended was preferred because it had a high response rate and only be required to be distributed to respondents to

complete and thus requires less time to be administered, offers the possibility of anonymity and data collected is first hand. To test the quality of the research instrument test-retest system was utilized with a coefficient above 0.7. The data collected from the respondents was presented and analyzed using simple descriptive statistics such as frequency distribution tables, percentages and arithmetic mean score. The mean cut-off point of 2.50 bench mark was adopted to determine acceptance and rejection of each item in the questionnaire. The hypotheses were tested with t-test statistical techniques.

Results and Discussion

Analysis of Respondents Profile

Table 1: Demographic Characteristics of the Respondents as (N=75)

S/N	Options	Variable	Frequency	Percentage (%)
1	Gender	Male	41	58.6
		Female	34	41.4
			75	100
2	Age	20-30	23	32.8
		31-40	39	48.5
		41 and above	13	18.5
			75	100
3	Marital Status	Single	33	40
		Married	42	60
			75	100
4	Educational Qualification	WAEC/NECO/GCE	9	12.9
		OND	28	40
		HND/B.Sc.	21	22.8
		M.Sc./MBA	10	14.2
		Others	7	10
			75	100

Source: Analysis of field survey, 2025.

From table 1, the gender distribution of respondents indicated that 58.6% (41) of the respondents were male while 41.4% (29) were female. The male respondents are therefore more represented in the sample. From the table above, showing the age distribution of respondents, it was observed that 32.8(23) of respondents were within 20-30 years, 48.5(34) were between 31-40 years and 18.5%(13) respondents were above 41 years. Thus, age bracket of less than 31-40 years are more represented in the sample. From the

table above showed the marital status of respondents. A total 40%(28) respondents were single, while 60%(42) respondents were married. From the table above showing the educational qualification of the respondents, it was observed that 12.9%(9) respondents have had WAEC/NECO/GCE qualifications, 40%(28) respondents has OND qualifications, 22.8%(16) respondents has HND/B.Sc. qualifications, 14.2%(10) respondents has M.Sc./MBA qualifications, and 10%(7) respondents had other qualifications

Analyses of Research Data

Table 2: Social Product and Consumer Buying Behaviour

Mean (x) and Standard Deviation Responses to Social Product

S/No.	Item	Mean (x)	SD	Remark
1	The Products and Services Offered meets the various needs of the customers	3.04	1.10	Accepted
2	The benefits offered by the company matches customers' desires	2.81	0.87	Accepted

3	The company delivers the articulated value as promoted	3.80	0.52	Accepted
4	We delivered promises consider the customer experiences	3.77	0.53	Accepted
5	The company communication makes customers aware about the new products	3.68	0.71	Accepted
Grand Mean (x) and Standard Deviation		3.42	0.74	Accepted

Source: Field Work 2025.

From Table 2, all the items have means (x) between 2.81 to 3.80 and a Standard Deviation of within 0.52 to 1.10. They were accepted because their means (x) were above the bench mark value of 2.50. Based on the result in Table 4.2, the grand means (x) response

regarding in which social product and consumer buying beahviour of selected departmental stores in South-South Nigeria is 3.42 with a Standard Deviation of 0.74. From the analysis, it was shown that the majority of the respondents agreed to items social product.

Table 3: Social Price and Consumer Buying Behaviour
Mean (x) and Standard Deviation on the Responses to social price

S/No.	Item	Mean (x)	SD	Remark
6	Customers Compare the Prices in Several Stores before Purchasing a Product in the Mall	3.57	0.79	Accepted
7	Customers expect seasonal discounts as part of the annual retail calendar	3.52	0.82	Accepted
8	Retailers use a seasonal discount to lure customers to buy their products/ services	3.35	0.96	Accepted
9	High price discount shows consumers that they are receiving low-quality products or service	3.32	0.99	Accepted
10	When consumers see a discount, they worry about the product they want to buy	3.04	1.10	Accepted
Grand Mean (x) and Standard Deviation		3.36	0.93	Accepted

Source: Field Work 2025.

From Table 3, all the items have means (x) between 3.04 to 3.57 and a Standard deviation between 0.79 to 1.10. They were accepted because their means (x) were above the bench mark value of 2.50. Based on the result in Table 4.3, the grand means (x) response

regarding on social price influence consumer buying behaviour is 3.36 with a Standard Deviation of 0.93. From the analysis, it was shown that all the respondents agreed to the items on social price and consumer buying behaviour.

Table 4: Social Promotion and Consumer Buying Behaviour
Mean (x) and Standard Deviation on the Responses to Social Promotion

S/No.	Item	Mean (x)	SD	Remark
16	Customers prefer promotional offerings that could be converted into monetary terms compared to freebies	3.66	0.61	Accepted
17	Sales promotion influences the purchase decision of consumers	3.81	0.39	Accepted
18	Promotional discounts may lead to increased traffic, but lower sales per transaction	3.48	0.79	Accepted
19	Consumers are more likely making purchase if I know that there is Buy and get one free+	3.56	0.80	Accepted
20	Consumers are willing to switch brands if under the crown prize is offered by the competing brands.	3.65	0.70	Accepted
Grand Mean (x) and Standard Deviation		3.63	0.65	Accepted

Source: Field Work 2025.

From Table 4, all the items have means (x) between 3.48 to 3.81 and a Standard Deviation between 0.39 to 0.80. They were accepted because their means (x) were above the bench mark value 2.50. Based on the result in Table 4.5, the grand mean (x) response regarding the

How social promotion stimulates the consumer buying behaviour of consumers. Thus, 3.63 with a Standard Deviation of 0.65. From the analysis, it showed that most of the respondent agreed that social promotion stimulates the consumer buying behaviour.

Testing of Hypotheses

Hypotheses One

Ho₁: social product has no significant effect on consumer buying behaviour of departmental stores in South-South, Nigeria

Table 5: T-test Table Showing Significant effect between Social product and Consumer Buying Behaviour of Departmental Stores in South-South, Nigeria

Items	N	Mean (x)	SD	DF	t _{cal}	t _{crit}	Level of significance	Decision
Social Product	53	3.80	1.10	73	0.53	2.013	0.05	Accepted
	22	2.81	0.52					

Table 7, t_{cal} (0.53) less than t_{crit} (2.013) at degree of freedom 73 and 0.05 level of significance. Therefore, the null hypothesis is rejected. This means that there is a significance relationship between social product and on consumer buying behaviour of departmental stores in South-South, Nigeria

Ho₂: social price has no significant effect on consumer buying behaviour of departmental stores in South-South, Nigeria.

Table 6: T-test Table Showing significant effect between social price and consumer buying behaviour of departmental stores in South-South, Nigeria

Hypothesis Two								
Items	N	Mean (x)	SD	DF	t _{cal}	t _{crit}	Level of significance	Decision
Social Price	53	3.57	1.10	73	0.058	2.013	0.05	Accepted
	22	3.04	0.79					

Table 6, shows t_{cal} (0.058) is less than t_{crit} (2.013) at degree of freedom 73 and 0.05 level of significance. This means that the null hypothesis is rejected meaning that there is a significance relationship between social price and on consumer buying behaviour of departmental stores in South-South, Nigeria

Ho₃: social promotion has no significant effect on consumer buying behaviour of departmental stores in South-South, Nigeria..

Table 7: T-test Table Showing Significant effect between Social Promotion and Consumer Buying Behaviour of Departmental Stores in South-South, Nigeria

Hypotheses Three								
Items	N	Mean (x)	SD	DF	t _{cal}	t _{crit}	Level of significance	Decision
Social Promotion	53	3.81	0.80	73	0.52	2.013	0.05	Accepted
	22	3.48	0.39					

Table 8, t_{cal} (0.52) less than t_{crit} (2.013) at degree of freedom 73 and 0.05 level of significance. Therefore, the null hypothesis is rejected. This means that there is a significant relationship between social promotion and on consumer buying behaviour of departmental stores in South-South, Nigeria

on the relevance of the marketing and societal marketing philosophies to contemporary practices, asserting that modern marketing prioritizes consumer needs and long-term societal welfare.

Discussion of Findings

Social Product and Customer Buying Behaviour ‘

The finding in Research question 1 shows that majority of the respondents agreed that social product increase customer buying behaviour of selected departmental stores in South-South Nigeria. This is supported by Rotimi (2024), examined the link between consumer behavior and modern marketing by analyzing the evolution of marketing philosophies, including production, product, selling, marketing, and societal marketing philosophies. Where the study emphasized

Social Price and Customer Buying Behaviour ‘

The finding in Research question 2 shows that majority of the respondents agreed that social price increase customer buying behaviour of selected departmental stores in South-South Nigeria. This is in line with Parag (2024) measured the impact of multiple pricing strategy on channel selection by consumers, to measure the satisfaction level of consumers while shopping on multiple channels at multiple prices and to measure influence of consumer shopping orientation on cross channel usage. Buyers are strongly influenced by product prices, with customer satisfaction serving as a moderating factor.

Social Promotion and Customer Buying Behaviour

The finding in Research question 4 shows that majority of the respondents agreed that the adoption of social promotion on customer buying behaviour of selected departmental stores in South-South Nigeria. This is supported by Oliha and Obiaka (2024), created a multifaceted advertising model that assesses the effect of informativeness, entertainment, irritability, and credibility on the valuableness of social media advertising and how these factors influence consumers' buying intentions. It adopted a covariance-based structural equation modelling approach where primary data was collected by administering questionnaires to a sample study of 364 selected participants, who were university students, employees, and entrepreneurs. The data gathered were analyzed using confirmatory factor analysis and structural equation modelling method were used to examine the correlation between the identified predictors and purchase intention while validating the model constructed. The results established that a strong correlation exists between the perceived value of informativeness and credibility of social media advertising and customer buying intention. The findings, while frowning that advertisements with overly entertaining content may irritate potential buyers, posited that perceived value is critical in the conversion of advertising engagement into purchase habit. The study significantly highlighted that perceived value is the key mediator in the proposed model with a very strong correlation that impacts consumers' buying intention; that is, consumers who perceive value in the ads are far more likely to express their buying intention. The study recommended that advertisers should focus on making their social media ads more valuable to positively affect customer perceptions

Summary, Conclusion and Recommendations

Summary of Findings

This study focused on sociological marketing and consumer buying behaviour of departmental stores in South-South, Nigeria. Four research questions were formulated to guide the study. Several literatures were reviewed and cited in this study for better understanding. This study adopted cross sectional survey research design method research design. The data collected from the respondents was presented and analyzed using simple descriptive statistics such as frequency distribution tables, percentages and arithmetic mean score. The mean cut-off point of 2.50 bench mark was adopted to determine acceptance and rejection of each item in the questionnaire. The hypotheses were tested with t-test statistical techniques. The findings revealed that:

- i. social product has significant effect on consumer buying behaviour of departmental stores in South-South Nigeria
- ii. social price has significant impact on consumer buying behaviour of departmental stores in South-South Nigeria
- iii. social promotion has significant effect on consumer buying behaviour of departmental stores in South-South Nigeria

Conclusion

The study of consumer buying behaviour is gate way to success in market. Also, understanding, analyzing and keeping track of consumer behavior is very critical for a marketing department to retain their position successfully in the market place.

Sociological marketing factors such as social product, social price, social place and social promotion seemingly influence consumer buying behaviour by determining when, how, what, and why to buy a particular product at a given time. These factors are also applicable to consumers in South-South Nigeria. Marketing may be a strategy in influencing a consumer to consume a product or brand, factors that socially and economically dictate the processes and actions are naturally in existence to guide and direct such an individual. This is true in many societies where people must consider their sociological marketing factors in determining their behavior toward consuming a product. Based on these findings the study concludes that every departmental and retail stores needs to be aware and implement those factors that brings about positive experiences while their sociological marketing factors used by them, so as to bring about a positive and desired influence on consumer buying behaviour.

Recommendations

These recommendations were based on the analyzed results and conclusions:

- i. retail outlets and departmental stores should focus on delivering personalized experiences by tailoring their messages, products, and services based on consumer behavior insights and marketers need to remain flexible and responsive to changes in consumer behavior, adapting their strategies to new trends, technologies, and shifts in market demand.
- ii. it is pertinent for managers to understand changing consumer needs, wants, and motivations and thereby devise the most appropriate mix for his market. Then, to the marketer the dynamic nature of consumer behavior implies rapid product development, changing communications, and distribution strategies in order to be more effective. While some outcomes may be significant to marketing practice the overall goal

of such research endeavor is to achieve better understanding of consumer behaviour

- iii. marketers should place in social services reasonably priced product as most of

Abstract

Succession in family business is a crucial component for business continuity and most of the family business successors are males which shows that leadership is skewed against females. This study explored gender dynamics and succession planning in family businesses: Evidence from in Ondo State. The study focuses on the perception about the succession process in family businesses related gender issues in Ondo State and why daughters may feel discriminated for succeeding their parents in a family firm. The study analyse the influence of cultural stereotype, trust and management ability on family business succession with focal point among Small And Medium Enterprises (SMEs) in Ondo State. Structured questionnaire schedule was delivered and data were acquired from 220 SMEs of family businesses, utilising a cross-sectional survey of descriptive research design. Data from the questionnaire were analysed using multiple regression in determining link among the variables. The findings suggested that cultural stereotype and trust has substantial influence on the choice of a successor in family businesses in Ondo State while managerial skill has insignificant influence on the choice of a successor in family businesses in Ondo State. It was proposed that the ability to run family business should be crucial in choosing a successor rather than to stereotype daughters on the basis of culture, since that will determine if the firm would continue.

Keywords: Family Business, Gender, Successor, Succession planning.

Introduction

Family businesses represent a critical component of global economic development, serving as the backbone of many economies worldwide. These enterprises are often characterised by strong organizational structures, strategic leadership positions occupied by family members, and a deep commitment to long-term success (Hania, 2018; Sharma & Salvato, 2021). As noted by Timmons and Spinelli (2017), family businesses have endured for centuries and continue to account for a significant proportion of global economic activity. Globally, family-owned enterprises constitute the largest form of business ownership, surpassing even multinational corporations in terms of prevalence. It is estimated that 65–80% of all businesses worldwide are either family-owned or family-managed (Foltz & Marshall, 2018; PwC, 2021). This trend is equally prominent in Africa, where family businesses are expanding rapidly. In Nigeria, family enterprises contribute approximately 46.54% to the nation's Gross Domestic Products (GDP) and represent over 80% of organized private sector businesses (SMEDAN, 2017, as cited in Ogbechi & Anetor, 2018). These businesses

form one of the oldest and most dominant organizational structures globally (Abouzaid, 2018), exerting significant influence on local and national economies (Shittu & Ibitomi, 2019).

Despite their socioeconomic relevance, succession planning remains a contentious issue in many family businesses, particularly in patriarchal societies like Nigeria. While both male and female offspring may be equally capable, succession tends to favour sons over daughters. This preference is often rooted in cultural norms, gender stereotypes, and societal expectations (Martin, 2011; Jimenez, 2009; Wang, 2016). The traditional primogeniture system, in which the first-born male inherits leadership, continues to shape succession decisions in many African and Middle Eastern contexts (Llano & Olguin, 2016).

Women in family businesses are frequently marginalized, relegated to less influential roles or excluded entirely from leadership (Byrne & Fattoum, 2015). Even in cases where daughters possess the requisite managerial skills, trustworthiness, and commitment, succession decisions are biased by perceptions of male dominance and concerns about

marital status or surname continuity (Miller, Steier, & Breton-Miller, 2013; Allen & Langowits, 2003; Pyromalis et al., 2008).

Recent studies have highlighted the barriers faced by women in attaining leadership positions within family enterprises (Barrett & Moores, 2019; Vera & Dean, 2015; Collins, Tucker, & Pierce, 2010). These barriers include not only overt gender discrimination but also subtler structural factors that disadvantage women. In patriarchal societies, cultural prescriptions often discourage female leadership, reinforcing the narrative that leadership is a male prerogative (Ayub & Jehn, 2022; OECD, 2023).

In Nigeria, particularly among the Yoruba ethnic group predominant in Ondo State, cultural factors play a central role in shaping succession decisions. Yoruba traditions often prioritize male heirs, viewing them as the legitimate bearers of the family name and authority (Aina, 2020). This study is thus situated in Ondo State, a region emblematic of gender-based succession biases, and covers the period from 2000 to 2025 capturing both pre- and post-COVID-19 perspectives.

This research focuses on three key variables: cultural stereotypes, trust, and managerial aptitude as they relate to gender preference in the succession planning of family businesses. These factors were chosen due to their observable prevalence and influence in the succession practices of family-run enterprises in the region.

The study makes several contributions. First, it enriches existing literature on gender dynamics in family business succession. Second, it provides practical insights for business owners and family business leaders to develop transparent and inclusive succession frameworks. Lastly, it offers a road map for policymakers to design equitable succession policies that support gender diversity and sustainability in family enterprises.

In essence, this study aims to investigate the extent to which cultural norms, trust dynamics, and perceived managerial competence influence gendered succession choices in family businesses. By doing so, it seeks to promote gender-inclusive practices that enhance business continuity and inter-generational equity in Nigeria's evolving enterprise landscape.

Literature Review

Conceptual Review

Cultural Stereotype

Stereotypes reflect a society's collective understanding of customs, values, beliefs, and social structures. These generalized assumptions are shaped by cultural, religious, and institutional influences (Macrae, *et al.*, 2015). According to social cognition theories, stereotypes form a crucial part of an individual's social

knowledge and directly influence interpersonal behavior (Hibbard & Buhrmester, 2011; Witt, 2018).

Stereotyping is defined as the cognitive process through which individuals perceive and judge others, particularly outgroup members, based on generalized beliefs. Gender stereotypes, in particular, are linked to cognitive schemas that drive expectations: men are often perceived as independent, assertive, and task-oriented, while women are viewed as nurturing, emotional, and people-oriented (Burr, 2000; Tavis, 2012).

Hofstede's cultural dimensions framework highlights how societies position men and women differently, influencing their roles both at work and at home (Ullah, 2015). In many traditional cultures, women's professional roles are often considered secondary to domestic responsibilities. This division is reinforced through early socialization via family, education, religion, and media (Hibbard & Buhrmester, 2011).

Family, a fundamental cultural unit, significantly influences organizational outcomes yet remains underexplored from a management standpoint. As a core socializing agent, the family not only shapes gender norms but also directly affects succession patterns and stakeholder expectations in family-owned enterprises (Chrisman, Chua, & Steier, 2016).

Trust is defined as the willingness of an individual to be vulnerable to another, based on the expectation that the latter will act in a reliable and non-opportunistic manner (Mayer, Davis, & Schoorman, 2015). Trust plays a pivotal role in family firms, where personal and professional relationships are deeply intertwined (Corbetta & Salvato, 2014; Steier, 2011).

Research shows that trust is a critical psychological construct influenced by emotion, past behavior, and social context (Baron, 2013; Dunn & Schweitzer, 2015; Weick, 2018). In family businesses, trust is not just a by-product of kinship ties but a strategic asset that enhances cooperation and reduces the need for formal control mechanisms (Sundaramurthy, 2018; Cruz et al., 2017).

Chrisman, Chua, Kellermanns, and Chang (2017) argue that long-term relational ties in family businesses foster unique trust dynamics, allowing for reduced agency costs and increased organizational commitment. Furthermore, the form and function of trust may vary depending on the stage of business development, leadership structure, and family involvement (Karra et al., 2016). Trust in family businesses may lead to stewardship behaviors, where leaders act in the interest of the firm rather than themselves, aligning with the family's long-term goals and values (Chrisman et al., 2017).

Managerial Aptitudes

Managerial aptitude refers to a leader's ability to make strategic decisions, motivate others, and implement ideas effectively. It encompasses conceptual, interpersonal, and technical skills vital for both short-term performance and long-term sustainability (Daft, 2019).

According to Daft (2019), managerial effectiveness requires:

Conceptual skills: Understanding how the organization fits into its environment.

Human (people) skills: Relating and working well with others.

Technical skills: Proficiency in specific tasks or tools relevant to the organization.

Davis (2014) emphasizes that execution delivering projects on time and within budget is a cornerstone of family business success. In the context of succession, managerial aptitude is a major determinant of who is seen as "fit to lead." Family size, business complexity, and perceived leadership competence often influence whether a male or female successor is chosen (Arieu, 2016; Nuthall, 2017).

Theoretical Review

Resource-Based View (RBV) Theory

The Resource-Based View (RBV) theory, introduced by Wernerfelt (1984), remains a foundational framework in strategic management. The theory posits that a firm's internal resources if valuable, rare, inimitable, and non-substitutable (VRIN) can offer sustainable competitive advantage and superior long-term performance (Barney, 1991; Peteraf, 1993). These resources extend beyond tangible assets to include intangible and socially complex capabilities such as organizational culture, trust, and leadership dynamics. In the context of family-owned businesses, the RBV provides a compelling explanation of how unique internal characteristics rooted in family involvement affect performance outcomes. Habbershon and Williams (1999) coined the term familiness to describe the idiosyncratic bundle of resources resulting from the interaction between family, business, and individual family members. These include trust-based relationships, commitment to long-term goals, shared values, and emotional attachment to the firm assets that are difficult to replicate in non-family businesses (Sirmon & Hitt, 2003; Chrisman, Chua, & Sharma, 2005).

Cabrera-Suárez, De Saá-Pérez, and García-Almeida (2011) emphasized that family firms often outperform their counterparts by leveraging unique combinations of knowledge, social capital, and managerial experience rooted in family tradition. However, the

same characteristics that provide competitive advantages may also constrain succession planning. Family dynamics and emotional ties can hinder rational decision-making during leadership transitions, especially when gender biases limit female successors' access to leadership (Bocatto, Gispert, & Rialp, 2010; Habbershon & Williams, 1999).

Thus, RBV offers a robust lens for examining succession in family businesses by linking internal firm characteristics such as managerial aptitude, trust, and family influence to organizational outcomes. In this study, RBV is relevant for understanding how gendered access to key managerial resources affects leadership succession decisions in Nigerian family firms.

Liberal Feminist Theory

Liberal feminism offers an essential theoretical foundation for exploring gender inequality in organizational and entrepreneurial contexts. Rooted in Enlightenment thought, liberal feminist theory argues that women should be granted equal rights, opportunities, and access to resources as men, particularly in areas of education, employment, and leadership (Tong, 2013; Bryson, 2003).

Liberal feminists contend that inequality is not biologically determined but is a consequence of legal, institutional, and cultural barriers that limit women's participation and advancement in society. The theory advocates for reform through legislative changes and social policies aimed at creating equal opportunities for women and men in both private and public spheres (Lorber, 2010). In the business world, this translates to removing discriminatory practices that prevent women from advancing to leadership positions, particularly in male-dominated domains such as family enterprises.

Within the family business context, liberal feminism helps explain the gendered processes that govern succession decisions. Numerous studies have shown that female successors are often overlooked or relegated to secondary roles due to persistent stereotypes about women's leadership capabilities, emotional suitability, and perceived loyalty (Cromie & O'Sullivan, 1999; Dumas, 1989; Lewis & Massey, 2011). Even when women possess equivalent or superior qualifications to their male siblings, cultural norms and family traditions frequently disadvantage them in succession planning (Janjuha-Jivraj, 2004; Poza & Messer, 2017).

Moreover, liberal feminist scholars have emphasized that while women may not always hold formal authority, they often possess informal or "hidden" power that influences strategic decisions in family businesses (Dhaliwal, 1998; Hollander & Bukowitz, 1990). However, without structural changes, such

informal influence rarely translates into formal leadership.

In this study, the liberal feminist lens is essential for interpreting how cultural stereotypes and discriminatory practices shape gender preferences in the succession of family-owned businesses in Nigeria.

Empirical Review

Gender bias in succession planning remains a persistent challenge across family businesses globally, with recent empirical evidence affirming the role of cultural norms, trust dynamics, and managerial competencies in shaping these outcomes.

Vicente, et al (2017) examined gender considerations in family business succession in Spain. Using qualitative methods through interviews with family business owners and successors, their findings revealed a persistent preference for male successors, despite claims of gender neutrality in leadership decisions. Female successors were often excluded based on traditional norms and self-selection bias, where daughters opt out due to anticipated gendered constraints and familial expectations.

In Nigeria, Nwadukwe (2016) studied the effect of Igbo inheritance culture on succession planning in indigenous enterprises in the South-East region. Using a descriptive survey and inferential analysis, the study showed that the primogeniture inheritance system significantly limits women's chances of ascending to leadership roles in family businesses. It concluded that succession in such contexts is predominantly guided by patriarchal norms that favour the eldest male child, reinforcing gender inequality.

Similarly, Irefin and Hammed (2012) assessed the influence of cultural beliefs on entrepreneurial succession in John Wax Nigeria Limited. Their study, based on data from 160 respondents, found a statistically significant relationship between indigenous cultural values and succession outcomes. The results emphasized that traditional norms serve as structural barriers to the inclusion of women in leadership transitions.

Bennedsen, et al (2017), in their landmark study of 5,334 family business successions in Denmark, found that first-born sons were significantly more likely to be chosen as successors than daughters. Their findings emphasized that even in Western contexts, gendered biases persist albeit in more nuanced forms affecting leadership continuity and gender representation.

Wang (2016), through a systematic literature review, concluded that daughters are consistently marginalized in family business succession across both developed and developing economies. The study identified a constellation of macro-level factors (societal attitudes) and micro-level dynamics (family preferences) that perpetuate female exclusion. These factors contribute

to the “invisibility” of women’s contributions to family enterprises and reinforce stereotypes that daughters are less competent or trustworthy.

Henry, Erwee, and Kong (2013), in a qualitative case study of Canadian family businesses, explored the intersection of trust and gender in succession planning. They identified two key dimensions of trust: interpersonal trust and competence-based trust. Their study revealed that founders were more likely to entrust leadership to male heirs, perceiving them as inherently more competent, despite the absence of supporting evidence. Female successors had to “over-prove” their capabilities in ways that male counterparts did not.

In Canada, Ibrahim, et al (2014) conducted interviews with 42 CEOs of family businesses and highlighted three core components of successor effectiveness: leadership ability, managerial competence, and familial respect. The findings underscored that while managerial aptitude is critical, gendered perceptions often overshadow objective evaluations of competence, disadvantaging women in succession plans.

Morris, et al (1997) emphasized the importance of trust and interpersonal communication in succession outcomes. Their findings confirmed that family relationships, especially the level of trust between the founder and potential successor, play a decisive role in the succession process. Steier (2011) further supported this by noting that trust in family businesses often substitutes for formal governance mechanisms, but it can also reinforce patriarchal norms that marginalize female successors.

Sundaramurthy (2018) reinforced the notion that trust is not only critical to performance but is often rooted in emotional and affective ties within family enterprises. This can both strengthen the business and limit inclusivity, especially when leadership decisions are emotionally biased against daughters.

Additionally, Schenkel, et al (2016) found that out of 444 family businesses listed on stock exchanges, only one had a female successor in the absence of male heirs. This stark underrepresentation signals a deep-rooted structural imbalance. Martin (2011) reported that business founders sometimes opted to sell their businesses or appoint external CEOs rather than hand over leadership to their daughters, regardless of competence or birth order.

Methodology

This study adopted a quantitative survey research design, which is appropriate for investigating relationships among variables using primary data collected via structured questionnaires. The design was chosen to enable the collection of standardized responses from a broad cross-section of respondents and to examine the causal relationship between gender preference and succession planning in family-owned

businesses with minimal researcher interference (Creswell & Creswell, 2018).

The target population comprised all registered Small and Medium-sized Enterprises (SMEs) with the Ondo State Ministry of Commerce and Industry. According to official data, there were 39,627 SMEs registered in Ondo State as of March 2025, encompassing family-owned businesses operating in Ondo Central, Ondo North, and Ondo South senatorial districts (Ministry of Commerce and Industry, 2025).

Table 1: Stratified Distribution of Sample

S/N	Region	SME Population	Sample Size
1	Ondo Central	26,345	265
2	Ondo North	7,213	72
3	Ondo South	6,069	62
	Total	39,627	399

Source: Field Survey (2025)

Primary data were collected using a structured questionnaire designed to elicit responses on cultural stereotypes, trust, managerial aptitude, and gender preference in succession planning. The instrument was pre-tested in a pilot study involving 40 respondents to , 2019).

A representative sample was determined using Yamane's (1967) formula for sample size calculation. Therefore, a sample size of 399 respondents was drawn from the population to ensure statistical reliability. A stratified random sampling technique was employed to ensure proportional representation from the three senatorial districts. The SMEs population was divided into strata based on geographic location (Ondo Central, Ondo North, and Ondo South), and samples were drawn proportionally from each stratum.

assess its validity and reliability. The internal consistency of the measurement items was evaluated using Cronbach's Alpha, rho_A, and Composite Reliability (CR) metrics. All constructs exceeded the minimum threshold of 0.70, indicating acceptable levels of reliability (Hair et al.

Table 2: Reliability and Validity Statistics

Variables	Cronbach's Alpha	rho_A	Composite Reliability
SFB (Succession in Family Business)	0.87	0.85	0.93
CSGP (Cultural Stereotype & Gender Preference)	0.92	0.76	0.78
TRGP (Trust & Gender Preference)	0.81	0.77	0.89
MAGP (Managerial Aptitude & Gender Preference)	0.79	0.82	0.92

Source: Field Survey (2025)

Data analysis was carried out using descriptive and inferential statistical methods with the aid of SPSS . Descriptive statistics (mean, frequency, and standard

deviation) were used to summarize demographic data and respondent perceptions. To test the study's hypotheses and evaluate the strength and direction of relationships between variables, Pearson correlation and multiple regression analysis were employed.

Data Analysis and Discussion

Table 3: Gender Distribution of Respondents Across Ondo State Senatorial Districts

Gender	Ondo North	%	Ondo South	%	Ondo Central	%	Total	%
Male	62	62.6	69	77.7	26	74.3	157	70.1
Female	37	37.4	21	22.3	9	25.7	67	29.9
Total	99	100	90	100	35	100	224	100

Source: Field Survey, 2025

From Table 3, a total of 224 valid responses were obtained from the three senatorial districts in Ondo

State. In Ondo North, out of 99 respondents, 62 (62.6%) were male, while 37 (37.4%) were female. In Ondo South, 69 out of 90 respondents (77.7%) were male and

21 (22.3%) were female. Similarly, in Ondo Central, 26 out of 35 respondents (74.3%) were male and 9 (25.7%) were female. Overall, the data show a clear male dominance among respondents, with males constituting

70.1% and females 29.9%. This finding suggests a higher level of male participation or preference in succession planning within family-owned businesses in Ondo State.

Table 4: Descriptive Statistics of Key Constructs

Variable	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	Std. Error
Succession in Family Business (SFB)	224	1	3	1.42	0.395	1.282	0.172
Cultural Stereotype (CS)	224	1	2	1.49	0.454	0.578	0.172
Trust (TR)	224	1	3	1.46	0.433	1.585	0.172
Managerial Aptitude (MA)	224	1	3	2.41	0.554	0.094	0.172

Source: SPSS Output, 2025

Table 4 presents the descriptive statistics for the main variables used in the study: Succession in Family Business (SFB), Cultural Stereotype (CS), Trust (TR), and Managerial Aptitude (MA). The mean scores indicate the average responses of participants on a Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). The mean for SFB is 1.42 (SD = 0.395), indicating general disagreement with items representing succession challenges. CS recorded a mean of 1.49 (SD = 0.454), suggesting that cultural stereotypes were modestly acknowledged by respondents.

TR had a mean of 1.46 (SD = 0.433), reflecting low levels of perceived trust as a barrier to succession. MA stood out with a mean of 2.41 (SD = 0.554), indicating a relatively higher perception of managerial aptitude as an important factor in succession planning. Skewness values for SFB and TR show positive skew, indicating that a majority of responses clustered toward lower values (i.e., disagreement), especially in trust-related items. In contrast, MA had the lowest skewness, suggesting more balanced responses. These insights form the basis for further inferential analysis in the subsequent section.

Table 5: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.823	.705	.610	0.305	1.756

- a. Predictors: (Constant), Cultural Stereotype (CS), Trust (TR), Managerial Aptitude (MA)
b. Dependent Variable: Succession in Family Business (SFB)

The model summary in Table 5 shows a strong correlation coefficient (R) of 0.823, indicating a robust positive relationship between the independent variables (CS, TR, MA) and the dependent variable (SFB). The

coefficient of determination (R^2) is 0.705, suggesting that approximately 70.5% of the variance in family business succession can be explained by the combined influence of cultural stereotypes, trust, and managerial aptitude. The Durbin-Watson statistic of 1.756 falls within an acceptable range, indicating that there is no significant autocorrelation among the residuals. This supports the reliability of the regression model for predictive and explanatory purposes.

Table 6: ANOVA Results

Model	Sum of Squares	Df	Mean Square	F	Sig.
Regression	18.013	3	6.004	72.014	0.000
Residual	15.157	221	0.069		
Total	33.170	224			

- a. **Dependent Variable:** Succession in Family Business (SFB)
b. **Predictors:** (Constant), CS, TR, MA

The results of the ANOVA test indicate that the regression model is statistically significant ($F = 72.014$;

$p < 0.001$), confirming that at least one of the predictors significantly contributes to explaining

changes in family business succession. This validates the model's overall fitness and rejects the null hypothesis that managerial aptitude, trust, and cultural stereotypes have no significant impact on family business succession.

Table 7: Coefficient Estimates

Model	Unstandardized Coefficients (B)	Std. Error	Standardized Coefficients (Beta)	t	Sig.
(Constant)	0.829	0.128	—	6.611	0.000
Cultural Stereotype (CS)	0.555	0.047	0.638	12.380	0.000
Trust (TR)	0.173	0.048	0.188	3.820	0.000
Managerial Aptitude (MA)	-0.061	0.036	-0.082	-1.673	0.096

Cultural Stereotypes and Family Business Succession

The regression results show that cultural stereotypes significantly influence succession planning in family businesses (**B = 0.555, $p < 0.01$**). This indicates that a unit increase in cultural stereotype perception leads to a 0.555 increase in succession outcomes. The high standardized beta coefficient (**$\beta = 0.638$**) underscores its strong explanatory power. This supports the hypothesis that cultural perceptions significantly shape leadership transitions in family enterprises.

Trust and Family Business Succession

Trust also emerged as a statistically significant predictor of succession (**B = 0.173, $p < 0.01$**). A unit increase in trust results in a 0.173 improvement in succession outcomes, suggesting that interpersonal trust among stakeholders fosters smoother transitions in family firms.

Managerial Aptitude and Family Business Succession

Interestingly, managerial aptitude recorded a **negative and statistically insignificant effect** on succession outcomes (**B = -0.061, $p = 0.096$**), indicating that higher managerial capability does not necessarily guarantee a successful succession. This finding challenges conventional assumptions and may point to underlying sociocultural or political dynamics that prioritize lineage or gender over competence in succession planning.

Discussion of Findings

The findings of this study provide empirical support for the hypothesis that cultural stereotypes significantly influence the choice of successor in family-owned businesses in Ondo State, Nigeria. The study revealed a positive and statistically significant relationship between cultural stereotypes and family business succession, suggesting that deeply ingrained gender norms and expectations shape succession planning processes. This finding is consistent with the work of Vicente et al. (2017), Daspit et al. (2016), Bennedsen et al. (2007), and Wang (2016), all of whom reported that cultural perceptions and gender-based expectations play a key role in shaping

succession decisions in family businesses. The results align with Gender Role Theory, which asserts that gender stereotypes influence how leadership potential is perceived. Stereotypical views portray women as nurturing, passive, and cooperative, while men are seen as assertive, decisive, and task-oriented. These social constructs affect how individuals judge their own leadership potential and how they are perceived by others. Consequently, female successors are often viewed as less capable or unsuitable for leadership, reinforcing a gender preference that favors male successors despite actual competence or managerial aptitude.

The study also confirms the positive and significant impact of trust on family business succession, supporting the second hypothesis. Trust between founders and potential successors was found to be a critical determinant of succession outcomes. This is in line with the conclusions of Henry et al. (2013) and Vera and Dean (2015), who emphasized that trust enhances communication, strengthens intergenerational relationships, and facilitates leadership transition in family enterprises. A high degree of trust reduces uncertainty and increases the likelihood of successful succession.

In contrast, managerial aptitude was found to have a negative and statistically insignificant influence on family business succession. This suggests that managerial competence, while important, does not significantly determine who is chosen as a successor in the study context. These findings echo those of Martin (2011) and Sonfield and Lussier (2015), who argued that succession decisions are often influenced more by social and cultural expectations than by demonstrable leadership or management skills. The perception that women are more risk-averse, less confident, and less assertive than men continues to shape succession decisions, regardless of their actual capabilities or professional experience.

In summary, the study reveals that non-technical and socio-cultural factors especially stereotypes and trust play a greater role than professional aptitude in shaping succession outcomes within family businesses in Ondo State. This emphasizes the need for a shift in succession planning frameworks, from culture-bound assumptions to merit-based criteria.

Conclusion And Recommendations

This study investigated the influence of cultural stereotypes, trust, and managerial aptitude on gender preference in family business succession in Ondo State, Nigeria. Based on empirical findings, it was concluded that gender preference remains largely skewed toward male successors, driven by cultural norms and perceptions rather than objective evaluations of managerial competence.

The study revealed that cultural stereotypes play a dominant role in shaping succession decisions, with the prevailing belief that male children are more suitable successors due to their ability to preserve the family name, uphold traditional values, and maintain control over family resources. This reflects entrenched gender biases, often to the detriment of equally capable female successors.

Furthermore, the study concluded that trust significantly influences succession outcomes, as families tend to express greater confidence in male successors, assuming they are less likely to divert the business outside the family structure. There is a perceived risk that female successors may transfer ownership or influence through marital ties, leading to reluctance in appointing them as successors.

While managerial aptitude was hypothesized to be a key determinant of succession, the findings suggest it plays a less significant role in actual decision-making. Rather than being selected based on skill, competence, or education, successors are often chosen based on gendered assumptions and family trust dynamics. This undermines the principles of merit-based succession planning and may compromise the long-term sustainability of the business.

This research contributes to the growing literature on gender dynamics in family business succession and highlights the need for more inclusive and competence-driven succession practices. It emphasizes the importance of challenging cultural norms that hinder women's participation in leadership within family enterprises.

Based on the study's findings and conclusions, the following recommendations are proposed:

- i. Promote gender-inclusive succession planning: Daughters should be considered equally for succession based on their capabilities, commitment, and leadership potential. Cultural stereotypes that limit female participation in business leadership should be actively discouraged through awareness and policy reforms within family enterprises.
- ii. Institutionalise trust based on competence, not gender: Families should build trust through transparency, mentorship, and shared experiences, rather than relying on gender-based assumptions. Trust should be cultivated based on demonstrated loyalty, business acumen, and integrity regardless of the successor's gender.
- iii. Prioritize managerial competence over cultural assumptions: Succession decisions should be guided

by managerial aptitude, educational qualifications, and leadership skills, rather than tradition or family expectations. Objective assessment tools and succession planning frameworks should be employed to identify the most competent successor.

iv. Capacity Building and Leadership Development for Female Successors: Family businesses should invest in leadership training, mentorship, and exposure for female members of the family to prepare them for potential leadership roles. This will help dismantle the myth of female inadequacy in business leadership.

v. Policy Advocacy and Legal Support: Stakeholders, including government and business associations, should promote policies that support gender equity in family business leadership and succession. Legal provisions should discourage discriminatory practices that exclude qualified female successors.

By adopting these recommendations, family-owned enterprises in Ondo State and by extension, Nigeria can foster inclusive, sustainable, and performance-driven succession planning, ensuring continuity, growth, and generational stability in family businesses.

Abstract

This study investigated the effect of sustainability reporting on corporate performance of publicly listed commercial banks in Nigeria using ex-post facto research design. The study examined how environmental, social, and governance disclosures affect financial performance (return on assets). The study used secondary data, utilizing information from audited annual and sustainability reports of the publicly listed commercial banks on the Nigerian Exchange Group. The study population comprised all publicly listed commercial banks on the Nigerian Exchange Group and the sample comprised publicly listed banks that had consistently published sustainability reports between 2019-2024. Data were analyzed via descriptive, diagnostic and inferential tools. The inferential statistical results revealed among others, significant positive effect of sustainability disclosures (governance, social and environmental) on corporate performance of the publicly listed commercial banks in Nigeria. Thus, the study concludes that sustainability reporting is a strategic driver of corporate performance and competitiveness in the Nigerian banking sector, although its effectiveness largely depends on disclosure quality, consistency, and transparency. On the basis of the finding, the study recommends that regulatory frameworks should be strengthened to standardize sustainability reporting, by ensuring compliance with global and national guidelines such as the global reporting initiative. In addition, there is need for capacity-building programs needed to be organized to train Nigerian commercial banks in effective disclosing sustainability issues in their financial statements.

Introduction

Practically, two fundamental tenets of sustainable business practices and efficient corporate governance are accountability and transparency. In order to facilitate informed decision-making and build confidence, transparency comprises the open presentation of timely, accurate, and trustworthy information to stakeholders (Ijeoma & Aronu, 2023). It includes non-financial disclosures such as environmental, social, and governance (ESG) indicators in addition to the distribution of financial reports. On the other hand, accountability means that businesses must explain their choices and actions to stakeholders and accept responsibility for the results (Enahoro, Adebayo & Momoh, 2019). Transparency in corporate governance reduces information asymmetry, lowers the risk of fraud, and boosts stakeholder confidence by guaranteeing that stakeholders—including investors, staff, regulators, and the general public - have access to vital information about a business's operations and decision-making procedures (Ogundare, 2020).

When assessing a company's sustainability performance, transparency is essential. Stakeholders can evaluate a company's contributions to societal objectives including poverty alleviation, climate action, and economic growth when it publicly discloses its environmental, social, and governance impacts (Owolabi & Iyoha, 2012). Accountability is more than just reporting; it also includes the procedures by which businesses are held accountable for their actions. Adherence to legal and regulatory frameworks and ethical decision-making are significantly influenced by it (Akinleye & Ogunmuyiwa, 2022). Corporate accountability is important in the context of sustainability reporting because it is enshrined in a number of laws and regulations in Nigeria, such as the Companies and Allied Matters Act (CAMA) and the Nigerian Code of Corporate Governance (NCCG). These frameworks require that directors and management act in the best interests of stakeholders.

Businesses must show that they have taken concrete steps to address their environmental and social impacts in addition to disclosing their governance,

social, and environmental performance. Accountability and transparency are principles that are mutually reinforcing. Accountability guarantees that this information results in significant action, whereas transparency guarantees that information is available. When combined, they produce a feedback loop that promotes trust and propels ongoing enhancements to business performance (Akpan, 2017). In the current era of increased stakeholder knowledge of environmental, social, and governance (ESG) issues, sustainability reporting has become a strategic instrument for improving corporate transparency and accountability.

In order for stakeholders to assess an organization's contributions to sustainable development, sustainability entails the methodical disclosure of its ESG performance (Enahoro et al., 2019). Sustainability reporting fosters long-term value creation, improves corporate reputation, and fosters trust by incorporating accountability and transparency into business operations (Owolabi & Iyoha, 2012). Transparency is essential to sustainability reporting because it guarantees that stakeholders can obtain accurate and trustworthy information about a company's activities and effects. Transparent sustainability reporting also gives stakeholders important information about a company's labour practices, environmental policies, carbon footprint, and community engagement initiatives (Amaeshi et al., 2018).

Sustainability reporting increases accountability by obligating corporations to demonstrate how they address the environmental and social repercussions of their operations. "Green-washing"—the act of misrepresenting environmental responsibility—is avoided by accountability measures incorporated into sustainability reporting, which guarantee that declared pledges result in concrete activities (Ogundare, 2020). Its function as a governance tool makes the connection between sustainability reporting, accountability, and transparency clear. By giving stakeholders the knowledge they need to hold businesses responsible for their ESG performance, transparent reporting helps to bridge the gap between stakeholder expectations and corporate behaviour. The evaluation of a company's capacity to accomplish its goals and provide value to stakeholders is known as corporate performance. In the past, financial indicators like profitability, revenue growth, and return on investment served as the main foundation for this assessment. Nonetheless, contemporary viewpoints on corporate performance take into account non-monetary metrics, like environmental, social, and governance (ESG) standards, acknowledging the wider influence that companies have on the environment (Adegbite & Ezeagba, Akamelu & Umeoduagu, 2022).

Given Nigeria's reliance on sectors like manufacturing, finance, and oil and gas, corporate performance plays a crucial role in determining the

nation's economic stability and growth. As stakeholders call for greater responsibility and transparency from businesses, the integration of financial and non-financial performance metrics has grown in popularity. A company's profitability, liquidity, and operational efficiency are all reflected in its financial performance, which is still a crucial aspect of corporate performance. Financial health is frequently assessed using metrics like return on assets (ROA). Macroeconomic variables such as inflation, exchange rate volatility, and regulatory policies have a significant impact on the financial performance of businesses in Nigeria (Ogundare, 2020). A company's environmental, social, and governance (ESG) contributions are the focus of non-financial performance, which is becoming more and more acknowledged as a factor in long-term value development (Odiaka, 2021).

Governance, social responsibility, and environmental effect are the main non-financial performance metrics. Environmental effect refers to the actions taken by businesses to minimise waste, save resources, and lessen their carbon footprint. Nigerian oil corporations, for instance, are judged on their capacity to invest in community development initiatives and reduce environmental harm (Okafor, Egbunike & Ezelibe, 2020). Initiatives that enhance community relations, worker welfare, and societal well-being are all part of social responsibility. Companies in Nigeria are increasingly adopting corporate social responsibility (CSR) programs to address issues such as poverty alleviation and education (Olayinka & Aminu, 2021). Companies with effective governance frameworks are more likely to gain stakeholder trust and maintain long-term success (Enahoro et al., 2019).

Corporate performance and sustainability reporting are central to the study of "Sustainability Reporting and Corporate Performance in Nigeria." These two components are essential to comprehending how corporate governance and business responsibility are changing in Nigeria. The purpose of the study was to investigate the connection between corporate performance in Nigeria and sustainability reporting. While corporate performance assesses a company's financial and non-financial accomplishments, sustainability reporting offers a framework for corporations to reveal their environmental, social, and governance (ESG) efforts. Arising from the above discuss, the study was set out to achieve three (3) specific objectives:

- iii) To examine the effect of environmental reporting on financial performance of listed commercial banks in Nigeria;
- iv) To ascertain the effect of governance reporting on financial performance of listed commercial banks in Nigeria; and
- v) To assess the effect of social reporting on financial performance of listed commercial banks in Nigeria.

Review of Related Literature

Sustainability Reporting

The process via which businesses inform different stakeholders on their Environmental, Social, and Governance (ESG) performance is known as sustainability reporting. It is a crucial component of contemporary business procedures, stressing responsibility and openness when dealing with sustainability challenges (Okafor, Egbunike, & Ezelibe, 2020). Organisations may demonstrate their dedication to sustainable development by using sustainability reporting to help them convey their sustainability projects, difficulties, and successes. The Global Reporting Initiative (GRI, 2021) states that it entails giving an impartial and balanced assessment of a business's activities, including its contributions to social justice, environmental preservation, and economic expansion. Sustainability reporting has become popular in Nigeria as a result of growing environmental deterioration, economic difficulties, and public demands for corporate social responsibility.

Nigeria's economic environment is closely examined for its effects on the environment and society, particularly in resource-intensive industries like manufacturing, gas, and oil. For instance, the Niger Delta's oil spills and gas flaring have brought attention to the necessity for businesses to report their environmental policies and operate sustainably (Amaeshi, Adi, Ogbechie, & Amao, 2018). A move away from a profit-only objective and towards a more inclusive strategy that takes ESG factors into account is reflected in the rising demand for sustainability reporting. Reporting on sustainability has several uses for businesses. It makes it possible for companies to conform to global standards such those set forth by the Sustainability Accounting Standards Board (SASB) and the Global Reporting Initiative (GRI). These frameworks offer recommendations for dependable, comparable, and consistent reporting. Businesses can acquire a competitive edge, draw in socially conscious investors, and show their dedication to ethical business practices by implementing these criteria (Olayinka & Temitope, 2021).

Moreover, sustainability reporting boosts a company's reputation and long-term value development by enabling it to track its performance against international standards such as the Sustainable Development Goals (SDGs) of the UN. However, there were several obstacles in Nigeria's way when it came to implementing sustainability reporting. Many businesses lack the technical know-how necessary to create thorough and precise reports (Olayinka & Aminu, 2021). According to a research by Uwuigbe, Uwuigbe, and Okorie (2018), many Nigerian businesses participate in "green-washing," which is the practice of inflating their sustainability initiatives in order to preserve a favourable public

perception. This cast doubt on sustainability reporting's ability to promote true corporate responsibility and damaged its credibility. Progress has been made in spite of these challenges.

Some Nigerian businesses have embraced sustainability reporting as a strategic tool for stakeholder engagement and reputation management, especially in the banking and telecoms industries. Companies, for example, have incorporated sustainability into their business plans and release yearly sustainability reports that conform to international standards. As businesses look to improve operational effectiveness, brand reputation, and investor attractiveness, this change shows an increasing understanding of the connection between sustainability reporting and performance (Akpan, 2017). In addition, sustainability reporting is essential for tackling Nigeria's environmental and socioeconomic problems. In order to match their operations with the nation's developmental goals, it encourages businesses to give priority to issues like gender justice, environmental conservation, and poverty reduction (Owolabi & Oluwaseun, 2020). In the end, sustainability reporting serves as a strategic framework for promoting long-term value creation, stakeholder trust, and sustainable economic progress in Nigeria rather than merely being a compliance instrument.

Governance Sustainability

A crucial part of sustainability reporting is governance sustainability reporting, which focusses on how businesses are run, controlled, and held responsible for their strategic choices and operations. It guarantees long-term business sustainability by demonstrating a company's dedication to moral behaviour, legal compliance, and efficient leadership structures (Oyeowo, Babajide & Oseni, 2020). Building trust, accountability, and openness between companies and their stakeholders requires governance sustainability reporting. Information about corporate governance frameworks, ethical standards, risk management, decision-making procedures, and stakeholder engagement must be disclosed as part of governance sustainability reporting (Uadiale & Fagbemi, 2012).

Reports on governance sustainability demonstrate how businesses incorporate governance ideas into their broader sustainability plans. Metrics including executive salary, anti-corruption measures, internal controls, board diversity, and regulatory compliance are frequently included in this kind of reporting. Guidelines for disclosures pertaining to governance are provided by frameworks such as the International Integrated Reporting Council (IIRC), Sustainability Accounting Standards Board (SASB), and Global Reporting Initiative (GRI) (Wang, Li & He, 2020). Since effective corporate governance guarantees that social, environmental, and economic objectives are in line with organisational strategy, these frameworks

highlight the significance of corporate governance in attaining sustainable growth.

The independence and organisation of a company's board of directors are highlighted in governance reports. It draws attention to the board's makeup, the inclusion of independent directors, and their responsibilities for monitoring management and defending the interests of shareholders. According to Uwuigbe, Uwuigbe, and Okorie (2018), listed businesses in Nigeria are required by the Nigerian Code of Corporate Governance (NCCG) 2018 to guarantee board independence in order to foster accountability and equitable decision-making. Organisations also reveal their ethical standards, which include anti-corruption policies, codes of conduct, and procedures for dealing with unethical behaviour. To illustrate their dedication to moral business conduct, Nigerian banks, for example, incorporate anti-bribery measures into their sustainability reports (Akpan, 2017). Insights into a company's risk management structure, including tactics for handling operational, financial, and reputational risks, are provided by effective governance sustainability reporting.

Furthermore, to make sure stakeholders are informed of potential obstacles and mitigation techniques, Nigerian companies frequently reveal how they handle market volatility, regulatory risks, and environmental concerns. The significance of openness in business processes is emphasised by this reporting. This covers revealing internal control systems, shareholder voting rights, and executive compensation. To increase stakeholder confidence, Nigerian corporations such as MTN Nigeria and Dangote Cement have integrated transparency into their governance reports. One essential component of reporting on governance sustainability is stakeholder involvement. Businesses reveal their relationships with communities, shareholders, workers, and authorities. Businesses in Nigeria that work in industries like oil and gas report on their efforts to involve the community in order to address social and environmental issues (Amaeshi et al., 2018).

Because of issues including corruption, lax enforcement of corporate governance regulations, and regulatory gaps, governance sustainability reporting is especially important in Nigeria. Businesses in Nigeria can solve a number of difficulties and improve their credibility by implementing governance reporting. Both domestic and foreign investors are more inclined to invest in businesses with strong governance frameworks that reduce risks and guarantee accountability when transparent governance procedures are in place. Additionally, Nigerian businesses can adhere to regional laws like the NCCG 2018 and the Companies and Allied Matters Act (CAMA) 2020 thanks to governance sustainability reporting. According to these rules, companies must reveal information about governance, such as the makeup of

the board and the operations of the audit committee. Businesses can show their dedication to moral behaviour by revealing their governance practices.

Organisations can restore stakeholder trust and conform to international best practices by using governance reporting. Because of bad governance, companies in Nigeria frequently run the risk of damaging their name. Companies can demonstrate their commitment to ethical and governance norms through governance sustainability reporting, which helps to prevent reputational harm and promote goodwill (Ezeagba, Akamelu & Umeoduagu, 2017). For Nigerian companies looking to strengthen stakeholder trust, improve corporate governance procedures, and conform to global standards, governance sustainability reporting is a vital tool. Businesses can boost their competitive edge, draw in investments, and support sustainable development by including governance disclosures in their sustainability reports. To fully realise the potential of governance sustainability reporting in Nigeria, however, issues like lax enforcement and low awareness must be addressed.

Social Sustainability

An organization's dedication to ethical responsibility and societal well-being is the main focus of social sustainability reporting. By addressing the social impact of businesses' operations, this component of sustainability reporting supplements environmental and governance reporting. It entails disclosing policies, practices, and results pertaining to social issues like diversity, human rights, employee welfare, community engagement, and social equity (Osemeke & Adegbite, 2016). Due to increased awareness of corporate social responsibility (CSR) and its impact on business success, social sustainability reporting has become more popular in Nigeria. Measuring and sharing an organization's social impact on its stakeholders is known as social sustainability reporting.

In addition, it covers topics like worker welfare, which includes things like workplace safety, training and development, fair pay, and work-life balance; contributions to the community through social investments, healthcare, education, and infrastructure development; and initiatives to advance gender equality, minority inclusion, and fair treatment of all workers. Businesses in Nigeria have started including social sustainability reporting into their overall corporate social responsibility plans. Ogunmuyiwa and Akinleye, 2022 Businesses in industries like banking, telecommunications, and oil and gas have realised how critical it is to solve societal issues like unemployment, inequality, and poverty. To improve their social license to operate, Nigerian oil firms such as Shell and Chevron, for example, reveal social investments in community development, health care, and education (Amaeshi et al., 2018).

Notwithstanding advancements, obstacles like lax enforcement of regulations, low awareness, and greenwashing techniques prevent social sustainability reporting from being widely adopted in Nigeria. It is impossible to overstate the advantages of social sustainability reporting for business performance. Among stakeholders, social sustainability reporting fosters goodwill and trust. Businesses may build brand loyalty and improve their reputations by showcasing a dedication to social well-being. For instance, Dangote Group's involvement in community development initiatives has enhanced company reputation, which has raised stakeholder confidence and consumer retention (Akpan, 2017). Additionally, workplace safety and employee welfare disclosures have a favourable impact on worker morale and output.

Top talent is drawn to and retained by organisations that place a high priority on social sustainability. According to Uwuigbe et al. (2018), Nigerian banks such as Access Bank have implemented social sustainability measures like health benefits and diversity programs, which have increased employee engagement and decreased turnover rates. A company's commitment to long-term wealth development is communicated to investors through social sustainability reporting.

Socially conscious partners and investors are drawn to ethical and responsible business activities. Reporting on social sustainability is essential to improving corporate performance in Nigerian companies. Businesses can increase trust, draw in investments, and achieve sustainable growth by tackling societal issues, encouraging openness, and supporting moral behaviour (Ijeoma & Aronu, 2023). The widespread adoption of social sustainability reporting in Nigeria can be accelerated by the adoption of standardised frameworks, raised awareness, and strong enforcement mechanisms, notwithstanding ongoing hurdles.

Environmental Sustainability

A subset of corporate sustainability reporting, environmental sustainability reporting focusses on how businesses control their environmental effects and provide stakeholders with pertinent information. It includes the measurement, tracking, and reporting of an organization's environmental impact operations, including energy, water, waste, and carbon emissions (Odiaka, 2021). Environmental sustainability reporting has emerged as a key component in recent years for encouraging openness and corporate responsibility in the face of global environmental issues.

Internationally accepted frameworks like the Sustainability Accounting Standards Board (SASB), the Carbon Disclosure Project (CDP), and the Global Reporting Initiative (GRI) Standards are frequently used to govern environmental sustainability reporting. These frameworks give standards and criteria that

organizations use to declare their environmental performance in a consistent and comparable manner (Ogundare, 2020). The GRI framework, for example, places a strong emphasis on reporting on important topics including pollution control, biodiversity preservation, and greenhouse gas (GHG) emissions. Companies can give investors, regulators, and the general public reliable and verifiable information by following these guidelines (GRI, 2021).

Nigeria's urgent environmental problems, such as deforestation, oil spills, gas flaring, and difficulties with urban waste management, have made environmental sustainability reporting more important in that country. Significant environmental damage has resulted from Nigeria's substantial reliance on gas and oil as its main sources of income (Okafor et al., 2020). ExxonMobil and Shell Petroleum Development Company (SPDC), two oil firms with operations in this area, have come under fire for their environmental policies. According to Amaeshi et al. (2018), environmental sustainability reporting has thus emerged as a means for these organisations to exhibit their dedication to reducing environmental harm and interacting with impacted people.

Reporting on environmental sustainability has multiple uses. In the first place, it assists businesses in recognising and reducing environmental risks related to their activities. Businesses that keep an eye on their energy usage and carbon footprint, for example, can put plans in place to cut emissions and switch to renewable energy sources (Okafor et al., 2020). This not only minimizes environmental harm but also enhances operational efficiency and cost savings. For example, some Nigerian banks, such as Access Bank and Zenith Bank, have incorporated environmental risk assessments into their sustainability reports, showcasing their efforts to finance eco-friendly projects and reduce resource consumption (Akpan, 2017). Second, environmental sustainability reporting plays a critical role in regulatory compliance.

Organisations in Nigeria are required to comply with environmental protection standards by laws like the National Environmental Standards and Regulations Enforcement Agency (NESREA) Act. By demonstrating adherence to these regulations through sustainable reporting, businesses can evade fines and fortify their operating licence. Nigerian regulatory enforcement is still lax, nevertheless, which causes differences in the calibre and extent of environmental disclosures made by different businesses (Uwuigbe et al., 2018). Furthermore, by transparently disclosing a company's environmental actions, environmental sustainability reporting encourages stakeholder engagement. This is especially crucial in Nigeria, where international organisations, local communities, and non-governmental organisations frequently examine business operations for their effects on the environment.

Reports on environmental sustainability draw capital from investors who care about the environment. Environmental, social, and governance (ESG) factors are becoming more and more important to investors around the world when they make decisions. Strong environmental declarations by Nigerian companies frequently provide doors to foreign funding and collaborations. For instance, Access Bank has established itself as a pioneer in green finance in Nigeria by using its sustainability reporting to draw in international investments (Uwuigbe et al., 2018). Through the identification and resolution of environmental inefficiencies, ESR helps companies reduce expenses and increase profitability. Businesses in Nigeria that keep an eye on the use of resources like electricity, water, and raw materials can put plans in place to cut waste and operating expenses. For instance, Dangote Cement PLC's sustainability initiatives, such as the use of energy-efficient production methods, have improved financial results by lowering costs while simultaneously lessening environmental harm. Additionally, companies must abide by environmental rules in Nigeria, which are enforced by the National Environmental Standards and Regulations Enforcement Agency (NESREA). It assists businesses in proving compliance, preventing fines and legal ramifications (Wang et al., 2020).

Corporate Performance

The ability of a business to accomplish its goals, please stakeholders, and add value over time is measured by its corporate performance. Financial performance, operational effectiveness, market competitiveness, and social responsibility are only a few of its many facets (Uwuigbe et al., 2018). Financial measures including profitability, revenue growth, return on equity (ROE), return on assets (ROA), and return on investment (ROI) were traditionally used to evaluate a company's performance. However, in order to reflect a shift towards a more comprehensive understanding of organisational success, contemporary corporate performance evaluations now include non-financial metrics including environmental, social, and governance (ESG) factors (Uadiale & Fagbemi, 2012).

In Nigeria, tackling socioeconomic issues, promoting innovation, and propelling economic progress all depend heavily on business performance. Nigerian companies are essential to the nation's GDP and job creation, especially in industries like banking, telecommunications, and oil and gas. For instance, the banking industry has made a substantial contribution to economic expansion and financial inclusion, while the oil and gas sector continues to be a major source of national income (Uadiale & Fagbemi, 2012). Therefore, enhancing corporate performance is a national objective as well as a

business necessity. A key component of assessing company performance is still financial performance. The sustainability and financial health of the company are evaluated using metrics like return on assets. For example, in order to give stakeholders information about their financial performance, companies listed on the Nigerian Exchange Group must release audited financial statements. Securing loans, drawing in investments, and preserving investor trust all depend on these reports. However, in a dynamic and complicated operating environment, a company's contributions and problems cannot be fully captured by financial success alone. Beyond financial and operational measurements, company performance increasingly stresses ESG factors. This change is a result of a greater understanding of how corporate operations affect society and the environment more broadly.

There is currently demand on Nigerian businesses to address problems like social injustice, environmental degradation, and governance transparency. A balanced approach to corporate performance that incorporates sustainability goals is necessary, as evidenced by the scrutiny of oil corporations in the Niger Delta for their community relations and environmental practices (Amaeshi et al., 2018). Market performance metrics like market share, brand reputation, and customer loyalty are also included in corporate performance. These elements are essential for long-term company viability, especially in cutthroat sectors like telecommunications. As companies and stakeholders see the importance of incorporating sustainability practices into organisational operations, the relationship between corporate performance and sustainability reporting in Nigeria is receiving more and more attention. This connection demonstrates how, especially in a demanding and changing context like Nigeria, sustainability reporting may impact financial results, operational effectiveness, stakeholder trust, and long-term business success.

Theoretical Framework

The legitimacy theory, which was developed in 1975 by John Dowling and Jeffrey Pfeffer to comprehend the interaction between organisations and their stakeholders, served as the foundation for this investigation. It asserts that organisations have legitimacy to function because they are part of a larger social framework (Akinleye & Ogunmuyiwa, 2022). When an organization's actions conform to societal standards, values, and expectations, legitimacy is attained. According to this notion, companies must consistently show their dedication to society values by implementing policies like accountability, transparency, and sustainability reporting.

According to legitimacy theory, organisations try to justify their operations by conforming to social norms and expectations. It originates from the more

general idea of a "social contract" between companies and society, according to which companies are given permission to function in return for making contributions to the welfare of society (Ezeagba et al., 2022). "A generalised perception or assumption that the actions of an entity are desirable, proper, or appropriate within a socially constructed system of norms, values, beliefs, and definitions" is what is meant by legitimacy. According to Ijeoma and Aronu (2023), achieving this legitimacy can be accomplished by proactive participation, communication, transparency, and adherence to social norms.

A vital technique for proving an organization's authenticity is sustainability reporting. Businesses respond to societal issues and demonstrate their dedication to moral business practices by making open and honest disclosures about their environmental, social, and governance (ESG) activities. This is especially crucial in Nigeria, where problems like social inequality, corruption, and environmental degradation frequently call into question the legitimacy of corporations (Odiaka, 2021). The goal of these initiatives is to preserve their operating licence and win back public trust. Legitimacy theory is especially applicable in Nigeria in fields that are subject to intense public scrutiny. According to the hypothesis, companies in delicate sectors give sustainability reporting and corporate social responsibility (CSR) initiatives top priority in order to meet public expectations.

Methodology

Results

Table 1: Summary of Descriptive Statistics

Variable	Mean	Std. Dev.	Min	Max
Return on Assets	1.1265	0.1984	0.835	1.542
Social Disclosure	74.346	9.8352	55.10	88.75
Environmental Disclosure	6.2840	1.4507	3.900	9.100
Governance Disclosure	11.953	3.2148	7.100	18.46

Source: Researcher's Computation (2025)

Table 1 reflects the summary of descriptive statistics; the dependent variable is financial performance (measured by return on assets - ROA), while the independent variables is sustainability reporting (measured by economic, social and governance disclosures). For return on assets (ROA), on the average, firms have a ROA of about 1.13 (with relatively low variability). ROA values range from 0.835 to 1.542.

Table 2: Pearson Correlation

Variables	ROA	SDR	EDR	GDR
ROA	1.0000			
SDR	0.0342	1.0000		
EDR	-0.0195	0.1981	1.0000	
GDR	0.0218	0.0645	0.2527	1.0000

Using an ex-post facto research design, this study examined how sustainability reporting affects corporate performance of Nigerian commercial banks that were publicly traded. The effect of governance, social, and environmental disclosures on financial performance (return on assets) was investigated. Information from the audited annual and sustainability reports of the publicly traded commercial banks on the Nigerian Exchange Group was used in the study as secondary data.

Furthermore, all publicly traded commercial banks on the Nigerian Exchange Group were included in the study population, and the sample consisted of publicly traded banks that have regularly released sustainability reports from 2019 to 2024. Descriptive, diagnostic, and inferential tools were used to analyse the data. The relationship was represented via a linear regression equation:

$$F = (EDR, SDR, GDR)$$

eq. 1

$$ROA_{it} = \beta_0 + \beta_1 EDR_{it} + \beta_2 SDR_{it} + \beta_3 GDR_{it} + U_{it}$$

eq. 2

Where: F =Financial performance; ROA; return on assets(measure of financial performance); EDR = Economic sustainability disclosure; SDR = Social sustainability disclosure; GDR = social sustainability disclosure; β = intercept (constant term); U_{it} = error term.

In terms of social disclosure, the average social disclosure score is 74.35, with moderate variation. Scores range from 55.10 to 88.75, indicating some firms are much more transparent than others. On the other hand, environmental disclosure had a mean of 6.28, with values ranging from 3.90 to 9.10, suggesting a relatively narrower range compared to social disclosure while governance disclosure recorded an average of 11.95, with scores ranging from 7.10 to 18.46, showing some dispersion in governance practices or transparency.

Source: Researcher's Computation (2025)

Presented in Table 2 is the Pearson correlation result between the independent and dependent variables of the study. The Pearson correlation between ROA and SDR (0.0342) is a very weak positive correlation, suggesting that as short-term debt ratio increases, ROA slightly increases, but the relationship is extremely weak and likely not meaningful. The correlation between ROA and EDR (-0.0195) is very weak negative correlation, indicating a negligible

inverse relationship between equity-to-debt ratio and profitability (ROA). For ROA and GDR (0.0218), it is very weak positive correlation, indicating growth in debt does not significantly influence ROA in this sample. Overall, the ROA shows negligible correlations with all three financial structure variables. This suggests that profitability (ROA) is not strongly explained by short-term debt, equity-to-debt, or debt growth, at least in a linear sense.

Table 3: Variance Inflation Factor (VIF)

Variable	SDR	GDR	EDR
VF	1.18	1.06	1.15
1/VF	0.847	0.943	0.870

Source: Researcher's Computation (2025)

From Table 3, the range of VF for the independent variables is between 1.06 to 1.18; however, none of the VIF result were below the conventional threshold of 10, suggesting that there is very low degree of multicollinearity among the pairs of the independent

variables of the study. The low VF shows minimal linear dependency among the independent variables, suggesting that each independent variable contributes uniquely to the empirical model without redundancy.

Table 4: Regression Results for SDR and ROA

Variables	Symbol	Coefficient	Std. Err.	t-Statistics	Sign.
Constant	_CONS	3.2840	0.9820	9.34	0.000
SDR	ROA	0.0890	0.0270	5.21	0.000
F-Value				20.30	0.000
R-Squared					0.684
R-Squared Adj.					0.577

Source: Researcher's Computation (2025)

Table 4 is the regression result for social sustainability reporting and return on assets. The intercept (Constant = 3.2840) implies that when the independent variable (ROA) is zero, the expected value of the dependent variable is 3.2840; however, the result is statistically significant at $p = 0.001$ ($p < 0.05$), so we can trust this estimate. SDR coefficient (0.0890) indicates that a 1-unit increase in SDR is

associated with an increase of 0.0890 units in the dependent variable (ROA), holding all else constant; however, it is statistically significant at $p = 0.002$ (well below 0.05 threshold), suggesting a strong and significant positive relationship between SDR and ROA. This result implies that social sustainability reporting significantly affects financial performance (ROA) of the listed commercial banks in Nigeria.

Table 5: Regression Results for EDR and ROA

Variables	Symbol	Coefficient	Std. Err.	t-Statistics	Sign.
Constant	_CONS	4.1030	1.2540	13.27	0.000
EDR	ROA	0.1270	0.0420	12.96	0.000
F-Value				28.78	0.000
R-Squared					0.643
R-Squared Adj.					0.5364

Source: Researcher's Computation (2025)

Table 5 is the regression result for environmental sustainability reporting and return on assets. The result revealed that when EDR = 0, the predicted value of dependent variable is 4.1030 and the intercept is statistically significant ($p < 0.05$), meaning it's unlikely to be zero. Also, for every 1 unit increase in EDR, the dependent variable increases by 0.1270 units, holding everything else constant. The p-value (0.003) indicates that this relationship is statistically significant at the 1% level. The high t-statistic (12.96) confirms strong evidence that EDR significantly predicts the dependent variable.

Table 6: Regression Results for GDR and ROA

Variables	Symbol	Coefficient	Std. Err.	t-Statistics	Sign.
Constant	_CONS	2.3010	0.5370	14.28	0.000
GDR	ROA	0.0620	0.0180	13.36	0.000
F(1, 128)				31.30	0.000
R-Squared					0.612
R-Squared Adj.					0.505

Source: Researcher's Computation (2025)

Table 6 is the regression result for governance sustainability reporting and return on assets. The intercept (_CONS) = 2.3010; this means when the independent variable (GDR) is zero, the expected value of ROA is 2.3010 units. This is the baseline level of ROA. Also, GDR Coefficient = 0.0620; this means for every 1-unit increase in GDR, the ROA is expected to increase by 0.0620 units, holding everything else constant. The standard errors (0.5370 for the constant and 0.0180 for GDR) measure the variability or uncertainty of the coefficient estimates. Smaller standard errors relative to coefficients suggest more precise estimates. The t-statistics test whether each coefficient is significantly different from zero. It is calculated as (Coefficient / Std. Err.). For instance, the intercept t-stat = $2.3010 / 0.5370 \approx 14.28$ and GDR t-stat = $0.0620 / 0.0180 \approx 13.36$; the high values indicate the coefficients are statistically significantly different from zero.

Furthermore, both the constant and GDR have p-values of 0.000 (typically interpreted as < 0.001), which means the coefficients are highly statistically significant at conventional levels (e.g., 1%, 5%). The F-statistic is 31.30 with a p-value of 0.000, which is highly significant. This means the model as a whole is statistically significant, and ROA provides useful explanatory power. R-Squared = 0.612; this means approximately 61.2% of the variance in the dependent variable is explained by ROA. This is considered a good fit in many contexts. This implies that governance sustainability reporting significantly affects financial performance (ROA) of the listed commercial banks in Nigeria.

Conclusion and Recommendations

Using an ex-post facto research design, this study examined how sustainability reporting affects

The overall regression model is statistically significant, meaning EDR as a predictor significantly explains variation in the dependent variable. A high F-value and $p < 0.05$ confirm the model's usefulness. The R-Squared = 0.643; this means that 64.3% of the variance in the dependent variable is explained by EDR and this is a relatively strong R-squared for many social sciences or finance-related models. The result implies that economic sustainability reporting significantly affects financial performance (ROA) of the listed commercial banks in Nigeria.

corporate performance of Nigerian commercial banks that were publicly traded. The study looked at the impact of governance, social, and environmental disclosures on financial performance. Information from the audited annual and sustainability reports of the publicly traded commercial banks on the Nigerian Exchange Group was used in the study as secondary data. All publicly traded commercial banks on the Nigerian Exchange Group were included in the study population, and the sample consisted of publicly traded banks that have regularly released sustainability reports from 2019 to 2024. Descriptive, diagnostic, and inferential tools were used to analyse the data.

Among other things, the inferential statistical results showed that sustainability disclosures (environmental, social, and governance) significantly improved the corporate performance of Nigeria's publicly traded commercial banks. Accordingly, the study comes to the conclusion that, while its efficacy is primarily dependent on the quality, consistency, and transparency of disclosures, sustainability reporting is a strategic driver of corporate performance and competitiveness in the Nigerian banking sector. The study suggests strengthening legal frameworks to standardise sustainability reporting by guaranteeing adherence to national and international standards, including the global reporting initiative, in light of the findings. Furthermore, in order to teach Nigerian commercial banks how to properly disclose sustainability issues in their financial statements, capacity-building programs must be set up.

Publication Date: 2025/11/28

Abstract

This study investigates the impact of sustainability accounting practices, statutory compliance, and strategic agility on organizational robustness in Nigerian organizations. A survey of Nigerian organizations was conducted, and data were analyzed using regression analysis. The findings reveal that sustainability accounting practices, statutory compliance, and strategic agility have a significant positive impact on organizational robustness. The study also finds that these variables collectively have a significant positive impact on organizational robustness. The results suggest that organizations in Nigeria can foster their robustness by adopting sustainability accounting practices, complying with regulations, and developing strategic agility. The study's findings have implications for organizational leaders, policymakers, and stakeholders seeking to promote robustness and sustainability in Nigerian organizations. The study builds upon and expands understanding on sustainability accounting, statutory compliance, strategic agility, and organizational robustness, and suggests a dynamic and interactive relationship among variables in the Nigerian context.

Keywords: Sustainability Accounting Practices, Statutory compliance, Strategic Agility, Organizational Robustness, Nigerian Organizations, Sustainability, Robustness Fosterment.

Introduction

In today's rapidly changing and uncertain business environment, sustainability accounting is more crucial than ever, it has become essential in navigating the increasingly complex and uncertain business environment. Sustainability accounting practices, statutory compliance, and strategic agility have helped in fostering organizational robustness (Adams & Larrinaga-González, 2007; Schaltegger & Burritt, 2010). The accounting practices involve the integration of sustainability considerations into accounting practices, enabling organizations to make informed decisions that balance economic, social, and environmental goals (Gray & Bebbington, 2001). In Nigeria, the demand for sustainability accounting practices is particularly pressing, given the country's environmental and social challenges (Owolabi & Olabode, 2017).

In today's uncertain business environment, organizations face numerous challenges, including environmental degradation, regulatory pressures, and market volatility (Adams & Larrinaga-González, 2007). Sustainability accounting practices have gained prominence as a key driver for organizations to manage their challenges and foster their robustness (Gray & Bebbington, 2001). According to Schaltegger and Burritt (2010), sustainability accounting practices involve the integration of

sustainability considerations into accounting practices, enabling organizations to make informed decisions that balance economic, social, and environmental goals.

In Nigeria, research findings have revealed that sustainability accounting practices can have a positive impact on organizational performance (Owolabi & Olabode, 2017). However, the role of statutory compliance in shaping sustainability accounting practices cannot be overstated (Amaeshi & Adi, 2011). Strategic agility, which involves the prompt response capability to environmental fluctuations, is also critical for organizational robustness (Doz & Kosonen, 2010).

Statutory compliance plays a critical role in shaping sustainability accounting practices, as organizations must conform to statutory requirements that fosters sustainability and environmental reporting (Amaeshi & Adi, 2011). Strategic agility, which involves the ability to quickly respond to environmental fluctuations, is also essential for organizational robustness (Doz & Kosonen, 2010). According to Ojua (2018), Nigerian organizations that adopt sustainability accounting practices and strategic agility are better positioned to withstand environmental uncertainties and achieve long-term success.

This study aims to access the influence of sustainability accounting practices, statutory compliance, and strategic agility in fostering organizational robustness in uncertain environments. Specifically, the research findings tend to answer the following research question: How do sustainability accounting comply with regulations, and strategic agility impact organizational robustness in uncertain environments?

Statement of the Problem

Despite the growing importance of sustainability accounting practices, statutory compliance, and strategic agility in enhancing organizational robustness, many organizations in Nigeria struggle to effectively integrate these concepts into their operations (Owolabi & Olabode, 2017; Ojua, 2018). The lack of effective sustainability accounting practices can contribute to environmental degradation, social injustice, and economic instability, ultimately threatening organizational robustness (Gray & Bebbington, 2001).

Moreover, statutory compliance remains a challenge for many Nigerian organizations, with some struggling to abide by laws and regulations that support and foster sustainability and environmental reporting (Amaeshi & Adi, 2011). The absence of strategic agility can also hinder organizational robustness, as companies may struggle to respond to environmental fluctuations (Doz & Kosonen, 2010). This research findings tends to address the following problems:

1. Limited understanding of sustainability accounting practices: Additional research is essential for sustainability accounting practices that strengthen business continuity.
2. Inadequate statutory compliance: Many Nigerian organizations struggle to abide by the regulations that is associated with environmental reporting, which can impact their robustness.
3. Lack of strategic agility: Organizations in Nigeria may not be adequately equipped to respond to environmental fluctuations, which can threaten their robustness.

Objectives of this study

The objectives of the study are:

1. To evaluate the connection between sustainability accounting practices and organizational robustness in Nigerian organizations.
2. To investigate the outcome on compliance on organizational robustness in Nigerian organizations.
3. To examine the contribution of strategic agility in enhancing organizational robustness in Nigerian organizations.
4. To provide insights and recommendations for Nigerian organizations to foster their robustness in uncertain environments through sustainability accounting conformity and strategic agility.

Research Questions

In alignment with the research objectives, the following research questions were proposed:

1. What is the connection between sustainability accounting practices and organizational robustness in Nigerian organizations?
2. To what extent does statutory compliance influence organizational robustness in Nigerian organizations?
3. How does strategic agility impact organizational robustness in Nigerian organizations?
4. What are the combined effects of sustainability accounting practices, statutory compliance, and strategic agility on organizational robustness in Nigerian organizations?

Research Hypotheses

In this study, the null hypothesis can be statistically evaluated in formulating hypotheses, they are:

H0₁: There is no significant connection between sustainability accounting practices and organizational robustness in Nigerian organizations.

H0₂: Statutory compliance has no significant outcome on organizational robustness in Nigerian organizations.

H0₃: Strategic agility has no significant contribution to organizational robustness in Nigerian organizations.

H0₄: Sustainability accounting practices, statutory compliance, and strategic agility collectively have no significant impact on organizational robustness in Nigerian organizations. These null hypotheses can be evaluated using statistical methods to ascertain if the evidence is sufficient for rejection or in favor of the alternative hypotheses.

Literature Review

Conceptual Framework

The conceptual framework for this study is based on the resource-based view (RBV) of the firm, which posits that organizations can achieve sustainable competitive advantage by leveraging their internal resources and capabilities (Barney, 1991). Sustainability accounting practices, regulatory requirement procedures, and strategic agility are considered key resources and capabilities that can improve organizational robustness in uncertain environments.

Sustainability Accounting Practices

Sustainability accounting practices involve the integration of sustainability considerations into accounting practices, enabling organizations to make informed decisions that balance economic, social, and environmental goals (Gray & Bebbington, 2001). Research findings have been seen to support the idea that sustainability accounting practices can positively influence organizational performance (Owolabi &

Olabode, 2017) and robustness (Schaltegger & Burritt, 2010).

Statutory compliance

Statutory compliance refers to the adherence to laws, regulations, and standards related to sustainability and environmental reporting (Amaeshi & Adi, 2011). Effectiveness statutory compliance can foster a robustness by reducing the potential fallout of non-compliance and associated penalties (Ojua, 2018).

Strategic Agility

Strategic agility is characterized by the ability to pivot in response to environmental changes in operational strategies accordingly (Doz & Kosonen, 2010). Strategic agility can strengthen organizational robustness by enabling organizations to plan for and react to environmental changes (Teece, Pisano, & Shuen, 1997).

Organizational Robustness

Organizational robustness refers to an organization's ability to withstand and recover from disruptions, challenges, and uncertainties. It encompasses the capacity to adapt, innovate, and evolve in response to changing internal and external conditions.

Organizational robustness is crucial for achieving sustainability and competitiveness in today's dynamic business environment. For instance, Oparanma and Elezie (2019) emphasize the importance of organizational robustness in fostering corporate performance, citing the need for deposit money banks in Nigeria to develop robust strategies to navigate turbulent market conditions.

Other authors also contribute significantly to the discourse on organizational robustness. Robertson, Callinan, and Bartram (2002) define organizational effectiveness as a multifaceted concept that encompasses various dimensions, including robustness, adaptability, and performance. They argue that organizations must prioritize building robust systems and processes to ensure long-term sustainability. Findings have shown that sustainability accounting practices, statutory compliance, and strategic agility can contribute to organizational robustness (Schaltegger & Burritt, 2010; Ojua, 2018).

Conceptual Model

The conceptual model for this research proposes that sustainability accounting practices, statutory compliance, and strategic agility are directly proportional to organizational robustness. The model also suggests that these variables collectively contribute to organizational robustness.

Theoretical Framework

The theoretical framework for this research is grounded in several theories that gives a deeper understanding into the relationships between sustainability accounting practices, statutory

compliance, strategic agility, and organizational robustness.

Resource-Based View (RBV)

The RBV posits that organizations can achieve sustainable competitive advantage by leveraging their internal resources and capabilities (Barney, 1991). Sustainability accounting practices, statutory compliance, and strategic agility can be considered key resources and capabilities that foster organizational robustness.

Stakeholder Theory

Stakeholder theory suggests that organizations have a responsibility to various stakeholders which includes people, planet and profit (Freeman, 1984). Sustainability accounting practices and meeting regulatory standards can facilitate the expectations of their stakeholders and foster their robustness.

Dynamic Capabilities Theory

Dynamic capabilities theory stresses the value of responsiveness and adaptability in responding to evolving circumstances (Teece, Pisano, & Shuen, 1997). Strategic agility can enable organizations to anticipate and react to evolving circumstances, enhancing their robustness.

Sustainability Accounting Theory

This theory focuses on the integration of sustainability considerations into accounting practices (Gray & Bebbington, 2001). Sustainability accounting practices can provide organizations with valuable information to make informed decisions that balance economic, social, and environmental goals.

Nigerian Perspective

In Nigeria, findings indicate that sustainability accounting practices and statutory compliance can contribute to organizational excellence and robustness (Owolabi & Olabode, 2017; Ojua, 2018).

Conceptual Model

The conceptual model for this research proposes that sustainability accounting practices, statutory compliance, and strategic agility are directly correlated with organizational robustness. The model also suggests that these variables collectively contribute to organizational robustness.

Linkage between Sustainability Accounting Practices and Strategic Agility

Sustainability accounting practices and strategic agility are interconnected concepts that can foster organizational performance and robustness. Sustainability accounting practices provide organizations with valuable information to make informed decisions that balance economic, social, and environmental goals (Gray & Bebbington, 2001). Strategic agility, alternatively, enables organizations

to quickly respond to environment fluctuations and adapt their strategies accordingly (Doz & Kosonen, 2010).

Sustainability Accounting Practices and Strategic Agility Integration

Sustainability accounting practices and strategic agility integration can enable organizations to:

1. Anticipate and react to environment fluctuations: Sustainability accounting practices can provide organizations with early warnings of potential environmental changes, while strategic agility enables them to respond quickly and effectively (Schaltegger & Burritt, 2010).
2. Make informed decisions: Sustainability accounting practices can provide organizations with valuable information to make informed decisions that balance economic, social, and environmental goals, while strategic agility enables them to adapt their strategies to changing circumstances (Teece, Pisano, & Shuen, 1997).
3. Foster organizational robustness: Sustainability accounting practices and strategic agility integration can foster organizational robustness by enabling organizations to anticipate and react to environment fluctuations, and adapt their strategies to changing circumstances (Linnenluecke, 2015).

Nigerian Perspective

In Nigeria, research findings have indicated that sustainability accounting practices can have a constructive contribution on organizational outcome (Owolabi & Olabode, 2017). Additionally, strategic agility can enable Nigerian organizations to react

swiftly to environment fluctuations and adapt their strategies accordingly (Ojua, 2018).

Empirical Review

Sustainability Accounting Practices and Organizational Robustness

Empirical studies have suggest that sustainability accounting practices can have a constructive contribution on organizational robustness. For example, Schaltegger and Burritt (2010) found that sustainability accounting practices can help organizations to identify and manage sustainability risks, which can foster their robustness.

Statutory Compliance and Organizational Robustness

Statutory compliance has also been found to have a constructive contribution on organizational robustness. Amaeshi and Adi (2011) found that statutory compliance can help organizations to manage compliance risks effectively and associated penalties, which can foster their robustness.

Strategic Agility and Organizational Robustness

Strategic agility has been found to be a key factor in fostering organizational robustness. Doz and Kosonen (2010) found that strategic agility supports organizations to quickly respond to environmental fluctuations and adapt their strategies accordingly, which can foster their robustness. Research have shown that sustainability accounting practices and statutory compliance can have contribute to organizational performance and robustness. For example, Owolabi and Olabode (2017) found that sustainability accounting practices can have contribute to organizational performance, while Ojua (2018) found that statutory compliance can help organizations to reduce the risk of non-compliance and associated penalties.

Empirical Findings

The empirical findings suggest that sustainability accounting practices, statutory compliance, and strategic agility are all important factors in enhancing organizational robustness. Organizations that adopt sustainability accounting practices, follow regulatory guidelines that are helpful to organizational advancement.

Research Methods

Research Design

This study will employ a quantitative research design, specifically a survey research design, to investigate the connection between sustainability accounting practices, statutory compliance, strategic agility, and organizational robustness.

Population and Sample

The targeted population consist of listed companies in Nigeria. A random sampling technique will be

used to select a sample of companies from the population.

Data Collection

Primary data will be collected through a questionnaire survey administered to the selected companies. The questionnaire will be designed to gather data on sustainability accounting practices, statutory compliance, strategic agility, and organizational robustness.

Data Analysis

Data analysis will involve statistical modelling. Specifically, regression analysis will be employed to validate and determine the connection between the variables.

Reliability and Validity

The reliability and validity of the research instrument will be ensured through pilot testing and Cronbach's alpha analysis.

Research Methods

- **Quantitative research design:** Allows for the collection and analysis of numerical data.
- **Survey research design:** Enables the collection of comprehensive data of companies.
- **Random sampling technique:** Allows for population interference.
- **Questionnaire survey:** Scalable data collection solution.

The research instrument that is used in this study will be a self-administered questionnaire designed to collect data on sustainability accounting practices, statutory compliance, strategic agility, and organizational robustness.

Questionnaire Design

The questionnaire will consist of closed-ended questions and will be divided into sections to capture the following variables:

1. **Sustainability accounting practices:** Questions will be adapted from existing literature (Schaltegger & Burritt, 2010) to measure the level to which companies adopt sustainability accounting practices.
2. **Statutory compliance:** Questions will be created to facilitate the level to which companies comply with relevant regulations and laws.
3. **Strategic agility:** Questions will be adapted from existing literature (Doz & Kosonen, 2010) to measure the level to which companies are strategically agile.
4. **Organizational robustness:** Questions will be created to facilitate the level to which companies are resilient in the face of uncertainty and change.

Questionnaire Administration

The questionnaire will be administered electronically to the selected companies after discussions has been made through emails and calls to the various companies.

Reliability and Validity

The questionnaire that will be used will be relied on in ensuring that;

1. **Pilot testing:** A pilot test will be conducted to verify that the questionnaire is clear and understandable.

Data Analysis and Results Presentation

Descriptive Statistics

The descriptive statistics for the variables are presented in the table below:

Variable	Mean	Median	Std. Deviation
Sustainability Accounting Practices	3.5	3.6	0.8
Statutory compliance	4.2	4.3	0.6
Strategic Agility	3.8	3.9	0.7
Organizational robustness	4.0	4.1	0.5

Source: *Researcher's Compilation, 2025*

2. **Cronbach's alpha analysis:** Cronbach's alpha analysis will be used to measure the internal consistency of the questionnaire items.

Method of Data Analysis

The data collected for this study will be analyzed using statistical methods. The following steps will be taken:

1. **Data Cleaning:** The data will be cleaned to validate its correctness and should be free from errors.
2. **Descriptive Statistics:** Descriptive statistics such as mean, median, and standard deviation will be used to summarize the data.
3. **Inferential Statistics:** Inferential statistics such as regression analysis will be utilized to test the hypotheses and determine the connection between the variables.
4. **Correlation Analysis:** This technique will be employed to appraise the connection between the variables.
5. **Software:** The data will be analyzed using statistical software such as SPSS or R.

Results Presentation of Data

The results of the data analysis will be presented using a combination of tables, figures, and narrative descriptions. The presentation will include:

1. **Descriptive statistics:** Tables will be utilized to present the mean, median, and standard deviation of the variables.
2. **Correlation analysis:** Tables will be utilized to present the correlation coefficients and p-values.
3. **Regression analysis:** Tables will be used to present the regression coefficients, standard errors, t-values, and p-values.

Interpretation of Results

The results will be interpreted in the context of the research questions and hypotheses. The interpretation will include:

1. **Discussion of Findings:** Compares and contrasts the results with existing research.
2. **Summary of findings:** A summary of the main findings will be provided.
3. **Implications of findings:** The implications of the findings will be discussed in the context of the literature and practice.

Correlation Analysis

The correlation analysis results are presented in the table below:

	Sustainability Accounting Practices	Statutory compliance	Strategic Agility	Organizational robustness
Sustainability Accounting Practices	1	0.6	0.7	0.5
Statutory compliance	0.6	1	0.4	0.3
Strategic Agility	0.7	0.6	1	0.6
Organizational robustness	0.5	0.6	0.6	1

Source: Researcher's Compilation, 2025

Regression Analysis

The regression analysis results are presented in the table below:

Model	R ²	F	β	t	p
Sustainability Accounting Practices	0.3	10.2	0.4	3.5	0.001
Statutory compliance	0.2	5.5	0.2	2.3	0.02
Strategic Agility	0.4	15.6	0.5	4.2	0.000

Source: Researcher's Compilation, 2025

Results Presentation

The results suggest that:

1. Sustainability accounting practices have a significant positive impact on organizational robustness.
2. Statutory compliance has a significant positive impact on organizational robustness.
3. Strategic agility has a significant positive impact on organizational robustness.

The findings of this study have implications for organizations seeking to foster their robustness in uncertain environments.

Test of Hypotheses One

There is no significant connection between Sustainability Accounting Practices and organizational robustness in Nigerian organizations.

Regression Analysis Results

The regression analysis results for Hypothesis One are presented below:

Model	R ²	F	β	t	p
Sustainability Accounting Practices	0.25	12.5	0.45	3.54	0.001

Source: Researcher's Compilation, 2025

Interpretation of Results

The results indicate that:

- The p-value (0.001) is less than the significance level (0.05), indicating a significant connection between Sustainability Accounting Practices and organizational robustness.
- The β coefficient (0.45) indicates a positive connection between Sustainability Accounting Practices and organizational robustness.
- The R² value (0.25) indicates that Sustainability Accounting Practices explain 25% of the variation in organizational robustness.

Based on the results, we reject the null hypothesis and conclude that there is a significant positive connection between Sustainability Accounting Practices and organizational robustness in Nigerian organizations.

Test of Hypotheses Two

Statutory compliance has no significant impact on organizational robustness in Nigerian organizations.

Regression Analysis Results

The regression analysis results for Hypothesis Two are presented below:

Model	R ²	F	β	t	p
Statutory compliance	0.15	6.2	0.30	2.49	0.014

Source: Researcher's Compilation, 2025

Interpretation of Results

The results indicate that:

- The p-value (0.014) is less than the significance level (0.05), indicating a significant impact of statutory compliance on organizational robustness.
- The β coefficient (0.30) indicates a positive impact of statutory compliance on organizational robustness.
- The R² value (0.15) indicates that statutory compliance explains 15% of the variation in organizational robustness.

Based on the results, we reject the null hypothesis and conclude that statutory compliance has a significant positive impact on organizational robustness in Nigerian organizations.

Test of Hypotheses Three

Strategic agility has no significant impact on organizational robustness in Nigerian organizations.

Regression Analysis Results

The regression analysis results for Hypothesis Three are presented below:

Model	R ²	F	β	t	p
Strategic Agility	0.35	18.2	0.55	4.27	0.000

Source: *Researcher's Compilation, 2025*

Interpretation of Results

The results indicate that:

- The p-value (0.000) is less than the significance level (0.05), indicating a significant impact of strategic agility on organizational robustness.
- The β coefficient (0.55) indicates a positive impact of strategic agility on organizational robustness.
- The R² value (0.35) indicates that strategic agility explains 35% of the variation in organizational robustness.

Based on the results, we reject the null hypothesis and conclude that strategic agility has a significant positive impact on organizational robustness in Nigerian organizations.

Test of Hypotheses: Collective Impact on Organizational robustness

Hypothesis Four

Sustainability accounting practices, statutory compliance, and strategic agility collectively have no significant positive impact on organizational robustness in Nigerian organizations.

Regression Analysis Results

The regression analysis results for Hypothesis Four are presented below:

Model	R ²	F	β	t	p
Sustainability Accounting Practices	0.40	25.1	0.30	3.15	0.002
Statutory compliance		0.20	2.50	0.014	
Strategic Agility	0.35	4.02	0.000		
Collective Impact	25.1		0.000		

Source: Researcher's Compilation, 2025

Interpretation of Results

The results indicate that:

- The collective model is significant ($F = 25.1$, $p = 0.000$), indicating that sustainability accounting practices, statutory compliance, and strategic agility collectively have a significant impact on organizational robustness.
- The R^2 value (0.40) indicates that the collective model explains 40% of the variation in organizational robustness.
- Each variable contributes positively to organizational robustness, with strategic agility having the strongest impact ($\beta = 0.35$), followed by sustainability accounting practices ($\beta = 0.30$), and statutory compliance ($\beta = 0.20$).

In accordance with the findings, we reject the null hypothesis and conclude that sustainability accounting practices, statutory compliance, and strategic agility collectively have a major contribution to organizational robustness in Nigerian organizations.

Discussion of Findings

The research explored the influence of sustainability accounting practices, statutory compliance, and strategic agility on organizational robustness in Nigerian organizations. The research results are detailed below:

Sustainability Accounting Practices and Organizational Robustness

The study found a synergistic connection sustainability accounting practices and organizational robustness. This finding suggests that organizations that adopt sustainability accounting strategies are likely to be resilient in spite of uncertainty and change. By adopting sustainability accounting practices, organizations can detect and manage sustainability-related dangers and prospects, which can contribute to improved organizational robustness.

Statutory Compliance and Organizational Robustness

The research found a significant positive connection between statutory compliance and organizational robustness. This finding suggests that organizations that comply with relevant regulations and laws which are intensified to be resilient. Statutory compliance can help organizations avoid judicial and brank-related risks, which can influence to improve organizational robustness.

Strategic flexibility and Organizational Robustness

The research revealed a significant positive connection between strategic agility and organizational robustness. This finding suggests that organizations that are strategically agile are intensified to be resilient. Strategic agility permits businesses to rapidly respond to environmental fluctuations, adapt their strategies, and allocate resources effectively, which can contribute to improved organizational robustness.

Collective Impact on Organizational Robustness

The research revealed that sustainability accounting practices, statutory compliance, and strategic agility collectively have a significant positive impact on organizational robustness. This finding suggests that organizations that adopt sustainability accounting practices, comply with regulations, and are strategically agile show a greater tendency to be resilient.

Implications of the Study

The research revealed implications for companies aiming to improve their robustness. The findings suggest that organizations should adopt sustainability accounting practices, comply with regulations, and develop dynamic capabilities to improve their robustness in adopting sustainability accounting practices.

Summary of Findings

The research investigated the effect of sustainability accounting practices, statutory compliance, and strategic agility on organizational robustness in Nigerian organizations. The key findings are:

1. Sustainability accounting practices have a major positive outcome on organizational robustness.
2. Statutory compliance has a significant positive impact on organizational robustness.
3. Strategic agility has a major positive outcome on organizational robustness.
4. Collective impact: Sustainability accounting practices, statutory compliance, and strategic agility collectively have a major positive outcome on organizational robustness.

The findings suggest that Nigerian businesses can foster their robustness by adopting sustainability accounting practices, complying with regulations, and developing strategic Agility.

Conclusion and Recommendations

Conclusion

By adopting sustainability accounting practices, complying with regulations, and developing strategic agility, organizations in Nigeria can improve their ability to withstand uncertainties and challenges, ultimately leading to improved performance and sustainability.

The study's results have implications for organizational leaders, policymakers, and stakeholders seeking to promote robustness and viability in Nigerian companies.

Recommendations

In accordance with the findings, the following recommendations are made:

1. **Adopt Sustainability Accounting Practices:** Nigerian businesses should adopt sustainability accounting practices to foster their robustness and sustainability.
2. **Ensure Statutory compliance:** Organizations should maintain adherence with relevant regulations and laws to mitigate legal and reputational exposure.
3. **Develop Strategic Agility:** Organizations should develop strategic agility to quickly respond to environmental fluctuations and adapt their strategies.
4. **Mainstream Sustainability into Organizational Practices:** Organizations should infuse sustainability into their business strategy to foster robustness and sustainability.
5. **Provide Performance Improvement:** Organizations should provide performance improvement to foster employees' expertise and capabilities on sustainability accounting practices, statutory compliance, and strategic agility. These recommendations will help Nigerian businesses foster their robustness and sustainability, ultimately leading to improved performance and long-term success.

Tax Relief and Firm Performance Of Selected SMES (Bakeries) in Ethiope East LGA of Delta State

DIBIE, Nkechi Patricia

Department of Business Administration,
Faculty of Management Sciences,
Delta State University, Abraka.

Publication Date: 2025/11/28

Abstract

This study investigates the impact of tax relief on the performance of small and medium-sized enterprises (SMEs) within the bakery sector, focusing on Bakeries in Ethiope East Local Government Area of Delta State. This study is motivated by the need to fill this gap in the literature by examining whether tax relief measures have a tangible impact on the performance of SMEs (Bakeries) in Ethiope East LGA of Delta State. This study holds significant implications for various stakeholders, including policymakers, business owners, and academics, particularly within the context of Delta State, Nigeria. Understanding the impact of tax relief on the performance of bakery will provide valuable insights for the formulation of more effective tax policies. The main objective of this study is to examine the extent of tax relief and firm performance of selected SMEs (Bakeries), Ethiope East LGA, Delta State. The research examines four key forms of tax relief: tax reduction, tax credits, tax offsets, and tax breaks, and their influence on firm performance. Utilizing a quantitative research design, data were collected from 120 respondents and analyzed using t-tests to determine the significance of the relationships between tax policies and firm performance. The results indicate that all four tax policies significantly affect the performance of SMEs, as evidenced by the rejection of the null hypotheses for each tax variable. These findings align with existing literature, highlighting the critical role of favorable tax policies in enhancing business growth and sustainability. The study concludes that targeted tax incentives are essential for fostering the development and competitiveness of SMEs, particularly in developing economies. This research contributes to the broader discourse on fiscal policy and SME development, offering valuable insights for policymakers aiming to stimulate economic growth through the support of small businesses.

Keywords: Tax reduction, tax credits, tax breaks, tax relief, performance, small and medium-sized enterprises.

Introduction

Tax relief, in various forms such as tax credits, exemptions, and reductions, is designed to alleviate the financial pressures on businesses, thereby enhancing their performance and competitive edge (Nguyen *et al.*, 2020). Empirical studies have shown mixed results, with some indicating positive impacts of tax relief on firm performance, while others highlight potential drawbacks such as reduced public revenue for infrastructural development. One of the most typically used incentive by the government is tax holiday, however this provision exempt companies from other tax liability, it likewise refutes some firms specific tax deductions over the tax holiday duration e.g., depreciation cost and interest expense having the tendency to offset a minimum of partially investment incentives. However, tax incentives are seen erroneously as easy incentives with a fairly reduced compliance concern e.g., no need to calculate income tax over the holiday duration. This understanding makes tax incentives more appealing at stimulating the growth and expansion of small and medium businesses. It has

been a great worry to all and sundry to promote the welfare of SMEs which the important sub sector has fallen short of expectation. The decreasing level of Nigeria's per capita income, which decreased from \$870 in 1981 to \$260 in 1998, and \$205 in 2004 in addition to a reduced level of agricultural, industrial and infrastructural development (irrigation, road and railway networks) all stand for disturbing indices, which likewise add to the dismal performance and contribution of our SMEs.

In Nigeria, various bodies have made attempts to define, what constitutes small-scale industry. Famous amongst them, is the National Council of Industry (2012). They defined small scale enterprises as an industry with a total capital employed of over N1.5 million but not more than N50 million, including working capital but excluding cost of land or a workforce of 11-100 workers. However, a more concise and coherent definition was given in the National Policy Micro, Small and Medium Enterprises (SMEDAN, 2016). In Nigeria, particularly in Delta State is bread. Almost everyone eats bread in Delta State University, Ethiope East

LGA. Almost up to 75 percent of breakfast diets in every household in Nigeria contain bread. There is a high level of demand for this commodity in Delta State University, Ethiope East LGA; just as petrol in the petroleum market in the country. Given the economic volatility and fiscal pressures in Nigeria, especially in the post-COVID-19 era, there is an urgent need to explore how tax policies can be optimized to support SMEs. This research therefore aims to fill the gap in the existing literature by specifically examining the impact of tax relief on the performance of selected SMEs (bakeries) in Ethiope East LGA, Delta State.

Problem Statement

Despite the crucial role that Small and Medium Enterprises (SMEs) play in the economic development of Delta State, Nigeria, these enterprises, particularly bakery, continue to face significant challenges that hinder their growth and sustainability. One of the foremost issues is the heavy tax burden imposed on them, which can stifle their operational capacity and competitive edge (Adebisi & Gbegi, 2018). While tax relief measures are theoretically intended to alleviate such burdens and foster better firm performance, there is a paucity of empirical evidence regarding their actual effectiveness within the specific context of SMEs in Ethiope East LGA of Delta State.

This study is motivated by the need to fill this gap in the literature by examining whether tax relief measures have a tangible impact on the performance of SMEs (Bakeries) in Ethiope East LGA, Delta State. The problem is twofold: firstly, there is an inadequate understanding of how various forms of tax relief affect the financial and operational performance of the enterprises. Secondly, policymakers lack robust data to inform decisions on tax policies that could potentially enhance the productivity and growth of SMEs. Without clear evidence, it remains uncertain whether tax relief measures are achieving their intended outcomes or if they need to be restructured to better support these businesses. This uncertainty can lead to suboptimal policy decisions, which may further hinder the growth prospects of bakery and SMEs more broadly in Delta State. Therefore, this study seeks to investigate the relationship between tax relief and firm performance, providing empirical insights that can guide more effective policy-making aimed at fostering the growth and sustainability.

Objectives of the Study

The main objective of this study is to examine the extent of tax relief and firm performance of selected SMEs (Bakeries) in Ethiope East LGA of Delta State. The specific objectives are to;

- i. To evaluate the extent to which tax reduction affects firm performance of selected SMEs

(Bakeries in Ethiope East LGA, Delta State)
Ethiope East LGA, Delta State.

- ii. To assess the extent to which tax credits influence firms performance of selected SMEs (Bakeries) in Ethiope East LGA of Delta State.

Theoretical Esposition

Concept of Tax Relief

Tax relief refers to various measures implemented by governments to reduce the tax burden on individuals and businesses, thereby stimulating economic activity and encouraging investment. These measures can take multiple forms, including tax exemptions, deductions, credits, and reductions in tax rates. Tax exemptions are a form of tax relief where certain income or activities are completely excluded from taxation. For instance, many countries offer tax exemptions for charitable organizations, which helps promote philanthropy and social welfare activities (Krever & Brooks, 2015). Tax deductions, on the other hand, allow taxpayers to subtract specific expenses from their gross income, thereby reducing the taxable income. Common deductions include those for mortgage interest, medical expenses, and education costs (Gale, Gelfond, & Krupkin, 2019). The economic impact of tax relief has been widely studied, with evidence suggesting that it can have significant positive effects on economic growth and employment. Tax relief measures can increase disposable income for households, leading to higher consumption and demand for goods and services. For businesses, tax relief can lower operating costs, increase profitability, and provide additional capital for investment Djankov *et al.*, 2010.

Concept of Tax Reduction

Tax reduction involves the intentional lowering of tax rates or tax liabilities to stimulate economic growth, enhance business performance, and increase compliance among taxpayers. This fiscal policy tool has been widely studied for its potential to positively impact various economic sectors, particularly small and medium-sized enterprises (SMEs). In Nigeria, tax reduction policies have gained prominence as the government seeks to promote business development and economic diversification. According to Adedeji and Olowe (2022), tax reductions play a critical role in improving the financial health of SMEs. By alleviating the tax burden, SMEs were able to allocate more resources toward innovation and expansion, thereby contributing to overall economic growth (Adedeji & Olowe, 2022).

Concept of Tax Credit

Tax credit involves a reduction in the amount of tax that an individual or business owes to the government, achieved through various incentives and programs. Unlike tax deductions, which lower taxable income, tax credits directly reduce the tax liability on a dollar-for-dollar basis. This makes tax

credits particularly valuable as they provide a direct benefit to taxpayers who qualify for them (Smith & Green, 2019). Tax credits serve multiple purposes, including stimulating economic activities, encouraging investments, and supporting specific policy goals. For example, research and development (R&D) tax credits are designed to encourage companies to invest in innovation by providing financial relief for R&D expenses. This helps enhance productivity, competitiveness, and technological advancement within the economy (Brown & Jones, 2020).

In environmental policy, tax credits are often used to promote investments in renewable energy. The Investment Tax Credit (ITC) in the United States, for instance, has been crucial in driving the growth of the solar energy sector by reducing the upfront costs associated with solar installations. This not only supports environmental sustainability but also stimulates economic activity in the green energy industry (Black & Newberry, 2022). By reducing the financial burden of education, these credits contribute to a more skilled and educated workforce (Jones & Brown, 2023).

Tax credits can be categorized into refundable and non-refundable credits. Refundable tax credits provide a benefit even if the credit exceeds the taxpayer's total tax liability, resulting in a refund. Non-refundable tax credits, on the other hand, can only reduce the tax liability to zero, with any excess credit typically not refunded but possibly carried forward to future tax years.

Firm Performance

Firm performance is a multifaceted construct that evaluates a business's overall effectiveness, efficiency, and success in achieving its objectives. This concept integrates various dimensions, including financial and non-financial metrics, which collectively provide a comprehensive view of the firm's health and strategic positioning. Financial performance indicators are paramount in assessing a firm's success and sustainability. These indicators include profitability ratios, such as net profit margin, gross profit margin, return on assets (ROA), and return on equity (ROE). Revenue growth is another critical financial metric, indicating the firm's ability to expand its sales over time. Consistent revenue growth is often a sign of market competitiveness and effective business strategies. Additionally, liquidity ratios, such as the current ratio and quick ratio, assess a firm's ability to meet short-term obligations, while solvency ratios, like the debt-to-equity ratio, provide insights into long-term financial stability and debt management (Gartenberg, Prat, & Serafeim, 2019). Non-financial performance metrics are equally important in providing a holistic view of firm performance. These metrics include customer satisfaction, employee engagement, innovation, and market share. Customer satisfaction can be measured

through surveys and Net Promoter Scores (NPS), offering insights into customer loyalty and service quality. High customer satisfaction typically correlates with repeat business and positive word-of-mouth.

Tax Relief and Firm Performance on SMEs

Tax relief, in the form of reduced corporate tax rates, tax credits, and deductions, can significantly enhance the profitability of SMEs. For bakeries, which often operate with slim profit margins, tax incentives can provide much-needed financial respite. According to Ilyas and Rajan (2020), such tax measures reduce operational costs and improve cash flow, enabling bakeries to reinvest savings into business operations and expansion. This reinvestment can lead to improved product quality, expanded product lines, and increased competitiveness.

Investment behavior among SMEs is also positively influenced by tax relief measures. Research indicates that tax incentives encourage SMEs to invest in new technologies, equipment, and infrastructure, which are vital for enhancing productivity and competitiveness. Recent studies have delved into how tax policies impact the growth and sustainability of these enterprises. Tax credits are a form of fiscal policy designed to reduce the tax liability of businesses, thereby incentivizing investment and promoting economic growth. In Nigeria, tax credits have been employed to stimulate the performance of small and medium-sized enterprises (SMEs). Egbunike and Abianga (2020) analyzed the role of tax credits in enhancing the performance of SMEs in Nigeria. Their study revealed that tax credits significantly alleviate the financial burden on SMEs, allowing them to reinvest savings into their businesses.

The Theoretical framework for this study is anchored on the sustainability- oriented innovation theory.

Sustainability-Oriented Innovation (SOI) Theory

Developed by René Jorna and Jan Poldner in 2018, the Sustainability-Oriented Innovation (SOI) Theory emphasizes the integration of sustainability into a firm's innovation processes (Jorna & Poldner, 2018). This theory posits that companies that incorporate sustainability into their core strategies are likely to achieve long-term growth and competitive advantage. For Bakeries in Ethiope East LGA, Delta State, tax relief can provide the financial leeway necessary to invest in sustainable practices and technologies, such as energy-efficient equipment and sustainable sourcing of materials. These investments not only help reduce operational costs but also enhance the firm's market reputation and customer loyalty. The alignment with the dependent variable (firm performance) is clear, as tax relief (the independent variable) enables the firm to undertake sustainability-oriented innovations, leading to improved efficiency and better overall performance.

Research Methodology

The survey research design was used in this research study. This is because the study's design involves sampling people's opinions and viewpoints. The population of this study consist of employees and management of selected bakery firms under study

(Delsu Bakery, DePaul Bakery, Earlyson Bakery, Efemena Bakery, Labrix Bakery, Mannie Bakery, Timmies Bakery, and Zion Excellent Bakery). A total of 190 employees and management of the selected bakeries operating in Ethiope East LGA of Delta state were chosen as the study population.

List of Selected Bakeries

S/N	Firm	Location	Product offered	No. Of staff
1.	Bakeries in Ethiope East LGA, Delta State	Campus 1, Delta State University, Ethiope East LGA, Ethiope East, LGA of Delta State	Bread Bakery	35
2.	Efemena Bakery	Kokori, Delta State	Bread Bakery	27
3.	Zion Excellent Bakery	Ethiope East LGA, Delta State	Bread Bakery	25
4.	Timmies Bakery	Ethiope East LGA, Delta State	Bread Bakery	23
5.	Earlyson Bakery	Ethiope East LGA, Delta State	Bread and Pastries	21
6.	Labrix bakery	Ethiope East LGA, Delta State	Bread and Pastries	21
7.	DePaul Bakery	Eku, Delta State	Bread Bakery	20
8.	Mannie Bakery	Ethiope East LGA, Delta State	Bread Bakery	18
	TOTAL			190

Source: Researcher field survey, 2024

Sample and Sampling Techniques

A study sample is only a carefully chosen portion of the population from which conclusions are drawn about the population as a whole. A total of 190 employees and management of selected Bakeries in Ethiope East of Delta state were chosen as the study population. The sample size was determined using Taro Yamane's sampling technique. 129 staffs and management were randomly selected as the study population. This sampling technique was considered appropriate because each subject in the population has equal chance of inclusion in the sample as it provides an unbiased and better estimate of the parameters if the population is homogenous (Sudman, 2015). The sample size was determined using the Taro Yamane's technique for sample selection. With A 95% confidence level and P = 0.5 are assumed Therefore, using the Taro Yamane formula below, we can determine the sample size;

Sample Size according to selected firm

S/N	Firm	Location	No. Of staff
1.	Delsu Bakery	Campus 1, Delta State University, Ethiope East LGA, Ethiope East, LGA of Delta State	17
7.	DePaul Bakery	Eku, Delta State	16
5.	Earlyson	Ethiope East LGA, Delta State	16
2.	Efemena Bakery	Kokori, Delta State	16
6.	Labrix	Ethiope East LGA, Delta State	16
8.	Mannie Bakery	Ethiope East LGA, Delta State	16
4.	Timmies Bakery	Ethiope East LGA, Delta State	16
3.	Zion Excellent Bakery	Ethiope East LGA, Delta State	16
	TOTAL Number of respondents		129

Source: Field data 2025

$$n = \frac{N}{1 + N(e)^2}$$

Where;

n = appropriate sample size

N = population size

e = co-efficient or confidence margin or error unit

e = 5% or 0.05

Thus, the sample size is evaluated as;

$$n = \frac{N}{1 + N(e)^2} = \frac{190}{1 + 190(0.05)^2} = 128.812$$

n = 129 staffs and managements (Rounded)

After calculating the sample size by substituting the number into the Yamane's formula, the number of sample was 129 staff and management, since am dealing with human beings, it is more realistic to approximate my sample size to 129.

Research Instrument

The instrument for data collection for this study was a structured questionnaire. The questionnaire consists of two parts, A and B. Part A, comprises items dealing with personal information about the staff and management. The Part B was well structured to capture five Likert scales; Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD).

Validity and Reliability

In order to ensure the validity of the research instrument, a draft of the questionnaire was submitted to the research supervisor and experts in

the field of banking and finance as well as experts in the field of measurement and evaluation. These experts went through the draft and make useful recommendations. These recommendations were effected before the final draft was made. At the end, the instrument was deemed to have met both face, content, and construct validity. It was established whether the research instrument was reliable. The instrument's reliability was assessed using the Pearson Correlation Coefficient. With a co-efficient of 0.68, the research tool was shown to be reasonably dependable. Taber (2017) states that a decent dependability is within the range of 0.67 to 0.87.

Pearson Correlation Coefficients between bakeries

Bakeries	1	2	3	4	5	6	7	8
1	1.000	0.831	0.686	0.630	0.0729	0.792	0.870	0.766
2	0.831	1.000	0.776	0.784	0.812	0.728	0.837	0.829
3	0.686	0.776	1.000	0.869	0.843	0.786	0.850	0.921
4	0.630	0.784	0.869	1.000	0.887	0.772	0.704	0.817
5	0.729	0.812	0.843	0.887	1.000	0.797	0.794	0.819
6	0.792	0.728	0.786	0.772	0.797	1.000	0.840	0.885
7	0.870	0.837	0.850	0.704	0.794	0.840	1.000	0.889
8	0.766	0.829	0.921	0.817	0.819	0.885	0.889	1.000

The average Pearson correlation coefficient (**r**) from correlation matrix is approximately **(0.805)**. It indicates a strong positive linear relationship among the variables, suggesting good consistency in the data.

Method of Data Collection

The data used for this research is primary data. The primary data was collected using a structured questionnaire that was administered to the staff and management of bakeries in Ethiopie East LGA, of Delta State. The questionnaire was adapted from Daniel and Okibo, 2015. The data collected for this study was analyzed using descriptive and inferential statistics. The descriptive statistical tools used include tables, graphs, pie charts, simple percentage while the inferential statistical tools used include Pearson product-moment correlation coefficient and multiple regression. Specifically, the demographic characteristics were analyzed and presented in tables. The research questions 1-4, were analyzed using

simple percentages and frequencies. The hypothesis 1-4 which had to do with relationship among variables, utilized the Pearson product-moment correlation coefficient. This was well suited because it was a parametric test and it measures the strength of linear relationship between two variables.

Data Analysis and Presentation of Results

In this study, the target population (Delsu Bakery, DePaul Bakery, Earlyson Bakery, Efemena Bakery, Mannie Bakery, Labrix Bakery, Timmies Bakery and Zion Excellent Bakery) a total sample number of one hundred and twenty-nine (129) respondents were drawn from the population distribution of respondents in the study population using the Taro Yamane's technique. One hundred and twenty-nine (129) copies of questionnaires were administered to respondents but only one hundred and twenty (120) copies were retrieved. This therefore form the basis of the data analysis.

Demographic profile of respondents

Items	Frequency	Percentage
Age		
18-25years	20	16.7%
26-30years	56	46.7%
31-39years	35	29.2%
40years and above	9	7.5%
Total	120	100%
Gender		
Male	75	62.5%
Female	45	37.5%
Total	120	100%
Educational level attained		
SSCE	37	30.8%

NCE	32	26.7%
B.SC	48	40.0%
PG/Masters	3	2.5%
Total	120	100%

Source: Primary data, 2024

Table 4. Shows that 56(46.7%) of the respondents are within the age bracket 26-30 which is the highest. While 35(29.2%) are within age bracket 31-39. 20(16.7%) are within the age bracket of 18-25, while only 9(7.5%) are within the age bracket of 40years and above. From the total respondents, 75(62.5%) were male and 45(37.5%) were female. Academic qualification of the respondents varied from secondary to university with most of them having gone above secondary. The majority of 48(40.0%)

have degree, 32(26.7%) have NCE and a fraction of 37(30.8%) have SSCE, while a little fraction of 3(2.5) are Master's degree holder. The enterprises value added activities of either manufacturing or food processing typically leverage on skills acquired after secondary education. This implies that the literacy level of owner managers were satisfactory.

Answering Research Questions

Research Question I: To what extent does tax reduction affect the firm performance of selected SMEs (Bakeries) in Ethiopia East LGA of Delta State?

Table 5: Effects of Tax Reduction on SMEs (Bakeries)

S/N	ITEM	SA	A	U	D	SD	Mean
1	Tax reductions have led to increased profitability in our bakery	66 (55.0%)	30 (25.0%)	22(18.3)	2(1.7)	-	1.67
2	Tax reductions have enabled us to hire more staff	27(22.5%)	24(20.0)	60(50.0)	9(7.5)	-	2.43
3	The bakery's financial stability has improved due to tax reductions	72(60.0%)	39(32.5%)	6(5.0%)	3(2.5%)	-	1.50
4	Tax reductions have allowed us to invest in new equipment and technology	47(39.2%)	25(20.8%)	48(40.0%)	-	-	2.01

Source: Primary data, 2024

Table 1 reveals that the majority of respondents believe tax credits have had a positive influence on their bakeries, with 55.0% agreeing that tax reductions have led to increased profitability, while 72% stating that the bakery's financial stability has improved due to tax reduction. Despite this positive outlook, a small portion of respondents (7.5% to 18%)

either disagree or are undecided, indicating some mixed views within the group.

Research Question II: To what extent does tax credits influence the firm performance of selected SMEs (Bakeries) in Ethiopia East LGA of Delta State?

Table 6: Influence of Tax Credits on SMEs (Bakeries)

S/N	ITEMS	SA	A	U	D	SD	Mean
1	Tax credits have significantly reduced our operational costs.	66 (55.0%)	30 (25.0%)	22(18.3)	2(1.7%)	-	2.08
2	The availability of tax credits has facilitated our expansion efforts.	27(22.5%)	24(20.0)	60(50.0)	9(7.5)	-	2.09
3	Tax credits have had a positive impact on our cash flow management.	72(60.0%)	39(32.5%)	6(5.0%)	3(2.5%)	-	2.13
4	The financial health of our bakery has improved due to tax credits.	47(39.2%)	25(20.8%)	48(40.0%)	-	-	2.27

Source: Primary data, 2024

The table reveals that the majority of respondents believe tax credits have had a positive influence on their bakeries, with 58% agreeing that these credits have significantly reduced operational costs, and 60% stating that tax credits have facilitated expansion efforts. Additionally, 63% agree that tax

credits have positively impacted cash flow management, while 53% believe these credits have improved the financial health of their bakery. Despite this positive outlook, a small portion of respondents (5.0% to 10%) disagree and 30% are undecided, indicating some mixed views within the group.

Research Question III: To what extent do tax breaks impact the firm performance of selected SMEs (Bakeries) in Ethiopia East LGA of Delta State?

Table 7: Impact of Tax Breaks on Firm Performance of SMEs (Bakeries)

S/N	ITEMS	SA	A	U	D	SD	Mean
1	Tax breaks have been essential in maintaining our bakery's operations during economic downturns.	56 (46.7%)	35(29.2%)	25(20.8)	4(3.3%)	-	1.81
2	Our bakery has experienced improved financial performance due to tax breaks.	46(38.3 %)	41(34.2%)	30(25.0 %)	1(0.8%)	-	1.95
3	The provision of tax breaks has allowed us to offer more competitive pricing.	52(43.3 %)	22(18.3%)	37(30.8 %)	9(7.5%)	-	2.03
4	Tax breaks have played a crucial role in our bakery's strategic planning.	31(25.5 %)	35(29.2%)	49(40.8 %)	-	5(4.2%)	2.23

Source: Primary Data, 2024

The table shows that most respondents believe tax breaks have significantly impacted their bakeries' performance. A substantial 71% agree that tax breaks have been essential in maintaining operations during economic downturns, and 72% believe they have played a crucial role in strategic planning. However, views are more divided on financial performance and

competitive pricing, with only 43.5% and 18.3% agreeing, respectively, while about 9% disagree or strongly disagree in both cases. This suggests that while tax breaks are largely seen as beneficial for stability and planning, their impact on financial performance and pricing is more contentious among respondents.

The Extent to which Tax relief influenced firm performance

	Frequency	Percent
To No Extent	6	5.0
To low Extent	10	8.3
To moderate Extent	68	56.7
To a great Extent	36	30.0
Total	120	100.0

Source: Primary data, 2025

According to the results in table 9. 30% indicated that the performance of their bakery had grown to great extent due to Tax relief, whereas 56.7% to a moderate extent and 8.3% to low extent while 5.0% indicated that their business performance had not improved at all. This indicates that competitive strategies influence performance to a great extent.

Test of Hypotheses

H0₁: Tax reduction does not significantly affect firm performance of selected SMEs (Bakeries) in Ethiopia East LGA of Delta State.

Table 10: Sample t-Test of Tax reduction and firm performance

Test Value = 0.05

Variables	N	Mean	SD	t-cal	Sig. (2tailed)	df	Decision
Firm Performance	120	.73	.830	9.572	.000		
Tax Credit	120	.07	.250	2.915	.004	119	Rejected

The analysis, conducted using a t-test, revealed a t-calculated value of 9.572 and a significance level of 0.000, both of which indicate a statistically significant relationship between tax reduction and firm performance. Given that the significance level is well below the conventional threshold of 0.05, the null hypothesis is rejected. This result suggests that

tax reduction significantly enhances the performance of SMEs in this context, highlighting the importance of favorable tax policies in improving business outcomes.

HO₂: Tax credits does not significantly influence firm performance of selected SMEs (Bakeries) in Ethiope East LGA of Delta State.

Table 11: Sample t-Test of Tax Credits and firm performance
Test Value = 0.05

Variables	N	Mean	SD	t-cal	Sig. (2tailed)	df	Decision
Firm Performance	120	.73	.830	9.572	.000		
Tax Credit	120	.09	.290	3.465	.001	119	Rejected

The hypothesis asserted that statistical analysis yielded a t-calculated value of 3.465 with a significance level of 0.001. This p-value < 0.05, provides strong evidence against the null hypothesis. Consequently, the null hypothesis is rejected, indicating that tax credits do, in fact, have a significant influence on firm performance. The findings underscore the role of tax credits as a crucial financial incentive that can positively impact the operational success of SMEs.

HO₃: Tax breaks do not significantly impact firm performance of selected SMEs (Bakeries) in Ethiope East LGA of Delta State.

Sample t-Test of Tax Offset and firm performance

Variables	N	Mean	SD	Test Value = 0.05			
				t-cal	Sig. (2tailed)	df	Decision
Firm Performance	120	.73	.830	9.572			
Tax Offset	120	.12	.322	3.964	.000	119	Rejected

The t-test results demonstrated a t-calculated value of 3.465 and a significance level of 0.001, both of which point to a significant effect of tax breaks on firm performance. Since the significance level is below the 0.05 threshold, the null hypothesis is rejected. This outcome implies that tax breaks are a significant determinant of firm performance, reinforcing the value of tax relief measures in enhancing the productivity and growth of SMEs.

Discussion of findings

The findings of this study reveal that tax policies, including tax reduction, tax credits, tax breaks, and tax offsets, significantly influence the performance of small and medium-sized enterprises (SMEs). Each hypothesis tested in the study was rejected, indicating that these tax mechanisms are critical determinants of firm performance. This aligns with existing literature, which underscores the pivotal role of tax incentives in enhancing the economic viability of SMEs.

Conclusion

This study provides a comprehensive analysis of the relationship between various forms of tax relief and the operational and financial performance of small and medium-sized enterprises (SMEs) within the bakery sector in Ethiope East Local Government Area (LGA) of Delta State. The study concludes that tax policies are vital tools for enhancing the performance of SMEs in Nigeria. The significant relationships observed between tax reduction, tax credits, tax breaks, and tax offsets with firm performance suggest that SMEs benefit greatly from favorable tax environments. These benefits manifest in improved profitability, better resource allocation, and enhanced capacity for growth and expansion.

Recommendations

For future research, this study recommends that;

- i. The government should design and implement tax relief programs specifically tailored for SMEs in the bakery sector, focusing on reducing tax burdens to enhance their financial flexibility and capacity for reinvestment.
- ii. Authorities should ensure that SMEs are well-informed about available tax credits and how to access them,

providing guidance and support to maximize the benefits of these financial incentives.

Abstract

This study examined the relationship between tender evaluation and procurement efficiency in Rivers State Government ministries. Tender evaluations were conceptualized as the independent variable, while value for money and public accountability served as measures of procurement efficiency. Two research questions guided the study, which adopted a cross-sectional survey design. The population comprised procurement officers across all 26 ministries in the Rivers State Government ministries. Given the manageable size of the population, a census approach was utilized. Instrument reliability was confirmed using Cronbach's Alpha, with all items scoring above 0.70. Data were analyzed using descriptive and inferential statistics, and two hypotheses were tested using Spearman's Rank Order Correlation at a 95% confidence level and a 0.05 significance threshold. Findings revealed a significant positive relationship between tender evaluation and procurement efficiency within the ministries. The study concludes that proper evaluation of tender in public procurement processes enhances transparency, reduces costs, and improves efficiency. It is recommended that public organizations in Rivers State should properly evaluate the tenders from vendors in order to ascertain the most suitable in terms of technical suitability, cost efficient and other capabilities also, stringent procurement policies be implemented to encourage proper bid evaluation which will foster efficient procurement practices .

Key words: Tender evaluation, Procurement efficiency, Value for money, Public accountability, Transparency

Introduction

Public Procurement process usually attracts a lot of corruption because of colossal sums of money involved and the opportunities that are available to unscrupulous people. Outside of salaries and social benefits, procurement accounts for the largest share of public expenditure at all tiers of government. In Nigeria, about seventy percent of corrupt practices are affected through the purchasing and supply of basic items for some Ministries, Departments and Agencies. Similarly, in most States, overall organizations lose seventy percent of their revenues to procurement corruptions each year. Crimes in this context are elaborated and refined, involving schemes such as abuse of power, corruption, bribery, favoritism, nepotism, and misappropriation (Padhi & Mohapatra, 2011). This negative behavior causes lost jobs and income, and scares away investment that could bring new prosperity to the country (Sullivan, 2000). Corruption in procurement poses serious threats to the stability of government to achieve its operational objectives. Tender evaluation and procurement efficiency helps

organizations to build a strong structure in terms of transparency, accountability and value for money in the public procurement of items for the organization. Tender evaluation helps organization to properly examine tenders who are competent and qualified to execute the project in a competitive atmosphere and the most qualified tender is considered. According to Albert Sanchez-Graells (2018), public procurement is a regulatory framework that aims to administer the interaction between the public buyer and the market in order to procure the best value for money in the expenditure of public funds to meet organizational requirements. However, most organization does not follow due processes in there tendering and competitive bidding processes, and this has hindered the development and growth of most public sectors in Rivers State, whereby encourage the procurement of low standard of facilities because of lack of adequate assessment of tenders' documents, which has led to corruption, collusion and bid rigging. Addressing these shortcomings is paramount to not only upholding the principles of tender evaluation and transparency but

also to fostering a competitive environment that maximizes the benefits of public procurement tendering for the broader society.

Theoretical framework

Theoretical framework in this study helps to serve as the foundation for this research from which all the knowledge associated with the entire research process was constructed. The theoretical framework for this study serve as the structure and support for the rational of the research, statement of the problem, the aim or purpose, the significance and statement of the research questions. The theoretical framework provides the foundation or grounding base for the review of literature of this study (Grant & Osanloo, 2014). Hence, theoretical framework for this study will serve as the blue print for our paper inquiring and provide guidance on which to build and support this research.

Carters '10 Cs', Bid Evaluation Theory

This theory was developed by Ray Carter in 1995 to help buyers determine the most suitable bidder who will be able to perform a contract or a tender that is awarded by providing wide range of criteria to evaluate and rank bidders. The bidder is evaluated on basis of '10 Cs', criteria which includes: cash; competency; commitment; consistency; capacity; control; cost; compatibility, compliance and communication (Caters, 1995). According to Carter, the bidder should be competent to fulfilling the contract by delivering goods, works and services requisitioned by the user. Have cash resources to ensure the stability of supply by determining his profitability and cash flow position whether it has working funds to pay its bills, buy materials and pay workers, assets he owns, the debts it owes, how its cost are structured and allocated and so its overall financial health. On the other hand, prove consistency in delivering and improving quality and service for example track record of reliability or process capability robust process, quality assurance and control. Moreover, prove capacity to meet current and future needs of the buying organization. Be committed to key values such as quality, service, or cost management. Have control systems in place for monitoring and managing resources for example quality and environmental systems, financial controls, risk management systems and so on. Reduce cost which is an aspect of price, whole life cost and value for money. Show evidence of compatible with the buying organization both cultural (in terms of values, ethics work approach, management style and so on) and technological (in terms of processes, organization and its IT systems). Should be compliant to sustainable legislations and standards, corporate social responsibility, and lastly can communicate effectively by having supporting technology to support supply

chain collaboration (CIPS, 2018). The theory add value by avoiding wasted cost, time, effort and embarrassment of awarding contract (on the basis of lower price) to a tenderer who subsequently turns out to lack capacity or technical capability to handle work.

Conceptual Review

Tender evaluation

The concept of Tender evaluation according to Herbsman and Ellis (1992), amount to the 'major' criteria of cost, time, and quality as measured by the bid amount, time of execution, and quality of previous work respectively. This implies that the winning bid is fully responsive to the contract in addition to the bidder's being sufficiently well qualified to undertake the contract (Hardy, 1978). Tender evaluation is used to indicate the procedure for strategic assessment to tender bids submitted by pre-qualified contractors. The strategy used for tender evaluation should reflect the client's objectives (Hardy, 1978). In addition, Herbsman and Ellis (1992) have also further project-specific criteria, including safety, durability, security, and maintenance. More objective methods have been proposed by Moselhi and Martinelli (1990) and Diekmann (1981) by means of multi-attribute utility techniques for combining the bid price and contractor selection criteria. The evaluation of bids by multi-attribute methods may encounter some difficulties when comparing different criteria measured by different scales. Hence various ways have been suggested for combining criterion values into a single scale. Herbsman and Ellis (1992), on the other hand, proposed a time/cost approach to determine the winning bid in the highway construction contracts. By converting the contract time to cost, a straightforward comparison can be made on a single criterion. Finally, Holt et al. (1993) combine their P2 and P3 score into a simple index by assigning 60% weighting for the P3 and 40% to the P2 score. Hence, it could be concluded that there is no consensus as yet on a common set of selection criteria for contractor selection. Selection criteria may vary in emphasis according to the characteristics of the project.

Procurement Efficiency

Procurement efficiency is a business term that refers to the ability of an organization to procure goods, services and works in a cost-effective manner Barsemoi, Mwangagi, and Asienyo (2014). It is a measure of how well an organization is able to acquire the goods and services it needs to run its operations, while minimizing the costs associated with the process. Here are some key reasons why effective procurement is crucial: Cost savings and effectiveness, effective procurement strategies help organizations obtain goods, services, and resources at competitive prices. This

leads to cost savings, better utilization of resources, and improved operational efficiency. Factors influencing procurement efficiency in organizations can vary depending on various internal and external factors. (Barsemoi *et al.*, 2014) highlight several key factors that impact procurement efficiency. One crucial factor is the level of transparency in the procurement process. Transparency ensures fairness and accountability, enabling organizations to identify potential inefficiencies and take corrective actions. Another factor is the presence of effective procurement policies and procedures. Organizations that have well-defined and streamlined procurement processes are more likely to achieve higher efficiency levels. Additionally, the availability of skilled procurement professionals plays a significant role in procurement efficiency. Competent personnel are essential in effectively managing supplier relationships, negotiating contracts, and implementing cost-saving measures. In summary, factors such as transparency, procurement policies, skilled professionals, technology adoption, and stakeholder collaboration all contribute to the procurement efficiency of organizations (Barsemoi *et al.*, 2014, cited in Idadokima, Nwaonuma & wordu 2024). Efficient procurement and cost reduction are essential for organizations to maintain profitability and gain a competitive edge in the market.

Measures of Procurement Efficiency

An effective procurement function contribute to the continuity of the organizations primary business activities, control and reduce all procurement related costs, reduce the organizations risk exposures in relation to its supply markets, and contribute to innovation that improves service delivery (Mueller, 2003 cited in Idadokima *et al.*, 2024), has reiterated that procurement performance connects with efficiency and effectiveness in carrying out daily activities. There are eight indicators that have been selected to measure procurement performance and these include; the level of contract utilization, suppliers performance, procurement cost, level of price variance, expiration management, procurement cycle time and variability, staff training and payment processing time.

Value for Money

The ultimate objective of the public procurement activity is to achieve best value for money in order to maximize economy and efficiency of public spending. This key operating principle relate to a number of factors which include not only the price of the goods, works or services, but also the suitability and satisfactory quality. Other influential factors may include total life cycle costs, maintenance, servicing costs, delivery/construction period, transportation or storage costs, as well as benefits of broader elements

whether environmental, social and economic. Baker, Dross, Shah, and Plastron (2013) noted that Value for Money (VFM) is a concept that has been widely used for some time within the commercial and industrial sectors which collaborated the views of Bidne *et al.* (2012) who acknowledged that value for money had been embraced internationally as an essential tool for assessing the relative costs and benefits of alternative options available for selection for the provision of a potential public project, though an often misunderstood phrase (Barr & Christie, 2014); Baker *et al.* (2013) further argued that there is no universal definition for the term value for money and the most cited definition states that value for money is 'the optimal use of resources to achieve the intended outcomes. The definition' of Value for Money is now in common currency, providing a framework for analysis shaped by economy, efficiency and effectiveness. However, the achievement of Value for Money should be assessed in conjunction with other project aspects such as service quality, risk transfer, and wider policy objectives (Akintoye, Hardcastle, Beck, Chinyio, & Asenova, 2003).

They further asserted that the overall project success is to a very large extent determined by the ability of the client to adopt and sustain the Value for Money regime throughout the project life. Therefore, It is worthy of note that securing value for money is not limited to some project delivery variants such as the traditional/conventional method of project delivery or to just design and build but to also variants such as public-private partnerships, relational contracting. Burger and Hawkesworth, (2011) noted that as a matter of principle, the choice between using a PPP or traditional procurement should be simple; however, governments should prefer the method that creates the most value for money.

Public Accountability

The concept of accountability involves the proper documentation of all the activities that take place in the procurement process and the responsibility to demonstrate that acquisition, works, services has been executed in accordance with the articulated rules and standards and the officer reports fairly and accurately on performance results vis-à-vis mandated roles and or/plans (Adegite, 2016). It means doing things transparently in line with due process and the provision of feedback. It shows the extent to which a person can be answerable to whoever has invested some amount of trust, faith and resources on them (Onuorah & Appah, 2014). Public accountability is an essential component for the functioning of our political system, use of public fund and the ascertainment of the procurement cost. Accountability is very important in determining the rationale behind all procurement decisions.

Accountability guarantees accurate written records, including computer records which are essential in demonstrating that proper ethical standards have been observed. Hence, appropriate records should be maintained throughout the procurement process. These records should provide an audit trail of the reasons for making a particular procurement decision. The type and detail of information that is recorded should be specified in local procedural guidelines and will depend on the complexity or sensitivity of the particular purchasing issue Nadi, (2009). As accountability means that those who are charged with drafting and/or carrying out policy should be obliged to give an explanation of their actions to their subjects, (Johnson, 2004). This mechanism allows the openness of the process and brings defaulters to book Okafor and Modebe (2015) opine that when activities are recorded accurately in the various stages of the procurement procedure accountability become feasible, and enable appropriate audit trail of procurement decisions for controls, and serves as the official records in cases of administrative or judicial challenges and provide the avenue for citizens to monitor.

Tender Evaluation and Procurement Efficiency

Twesigye, Shadrack, Anita, Baker and Brian (2022) examined the relationship between Bid evaluation practices and Contract performance in the Uganda Police Force (UPF). The study examined the three research objectives namely: relationship between bidder compliance and contract performance, relationship between technical evaluation of bidders and contract performance and lastly the relationship between financial evaluation of bidders and contract performance in UPF. The study adopted a cross

sectional survey design and employed both quantitative and qualitative approaches in data collection and analysis. The researcher used both primary and secondary data and analyzed data using Pearson correlation and multiple linear regression models. The results of the finding showed that there was a significant relationship between bid valuation practices under study and contract performance where by (bid compliance $r = .062$; $p < .802$) (technical evaluation $r = .349$; $p < .156$) and (financial evaluation $r = .074$; $p < .771$) respectively. The study concluded by mentioning that it's important for UPF to effectively conduct bid evaluation practices so as to enhance contract performance for effective service delivery. The study came up with several recommendations that UPF should comply with for optimal and effective utilization of resources by the force which include complying with general Procurement Principles and PPDA guidelines on public procurement in order to achieve effective contract performance. Although, the study was carried out in Uganda while ours study is in the Rivers State government ministries Nigeria. In conclusion, the adoption tender evaluation has proven to have a positive influence on procurement efficiency, as it improves transparency, reduce cost of Government spending, and enables value for money. Based on the foregoing, the study thus hypothesized that:

Ho1: There is no significant relationship between tender evaluation and value for money in the Rivers State Government ministries.

Ho2: There is no significant relationship between tender evaluation and public accountability in the Rivers state Government ministries.

This study conceptualized a frame work as shown in Figure1.

Figure 1.1: Conceptual frame work of tender evaluation and Procurement efficiency in the Rivers State Government ministries.

Methodology

The study adopted a cross-sectional survey in its investigation of the variables. The population for the study comprised twenty-six (26) ministries in the River State civil service. The study focused on procurement officers in the 26 ministries. Preliminary investigation

from the office of Head of service revealed that there are at least three (3) procurement officers in each of the ministries. Two research questions were asked. However, there was no need to venture into the rigorous procedures for determining an appropriate sample size because our population of study was not large and is less than thirty (30). Hence, we studied the entire accessible population (census) of twenty (26) Ministries in the Rivers State Civil Service. The researcher randomly distributed three (3) structured

copies of the questionnaire per ministries, which correspondingly summed up to seventy eight (78) copies of questionnaire. The reliability of the instrument was achieved by the use of the cronbach Alpha coefficient with all the items scoring above 0.70.

Two hypotheses were tested using the spearman's Rank Order correlation coefficient with the aid of statistical package for social sciences (SPSS) version 23.0. The test were carried out at a 95% confidence interval and a 0.5 level of significance.

Data Presentation and Analysis

Table 1.1 Reliability Coefficients of Variable Measures

S/N	Dimensions/Measures other study variable	Number of items	Cronbach's Alpha	Comment
1	Tender evaluation	5	0.781	Reliable
2	Value for money	5	0.798	Reliable
3	Public accountability	5	0.780	Reliable

Source: SPSS Output, (2024).

Table 2.1 Response Rates and descriptive statistics for tender evaluation (n=59)

	<i>Tender Evaluation</i>	VHE	HE	ME	VLE	VHE	Mean	Std.
1	The evaluation committee signs and observes signing ethical code of conduct during the evaluation of bids.	8	9	9	15	18	3.44	1.418
2	Bidders have a certificate of Incorporation.	6	6	9	21	17	3.63	1.285
3	Bidders have transaction tax clearance.	5	4	8	13	29	3.97	1.299
4	Ethical code of conduct document is signed by bid evaluation committee before evaluation commences.	-	1	7	33	18	4.15	0.690

Source: Research Survey Data, (2024).

In response to item one, respondents affirmed that evaluation committee signs and observes signing ethical code of conduct during the evaluation of bids. This is accounted for by the high mean score of 3.44. Similarly, it was agreed that bidders have a certificate of Incorporation. This is also confirmed by the high mean score of 3.63. More so, the third item got similar approval as respondents agreed that bidders have

transaction tax clearance thus saving time in ministry. The mean score of 3.97 also speaks volume of this status. Furthermore, fourth item got an affirmative response that Ethical code of conduct document is signed by bid evaluation committee before evaluation commences. Thus speeds up the evaluation process in our ministries. This is backed by a mean score of 4.15

Table 2.2 Response Rates and descriptive statistics for Value for Money (n=59)

	<i>Value for Money</i>	VHE	HE	ME	VLE	VHE	Mean	Std.
1	Value for money helps contractors to utilize resources efficiently to achieve the intended outcomes.	5	4	8	13	29	3.97	1.299
2	Value for Money helps contractors to have a better understanding of the cost implications of product.	6	7	6	15	25	3.78	1.378

3	Value for money helps contractors combine cost, quality, and sustainability to meet customer requirements.	-	4	9	25	21	4.07	0.888
4	Project success is determined by the ability of the client to adopt and sustain the value for money throughout the project life.	-	-	11	39	9	3.97	0.586

From table

Table 2.3 Response Rates and descriptive statistics for Public accountability (n=59)

	Public accountability	VHE	HE	ME	VLE	VHE	X	Std.
1	Public accountability enhance contractors confidence in bidding process	9	8	6	26	10	3.34	1.334
2	Public accountability enhance transparency	8	9	9	15	18	3.44	1.418
3	Public accountability promote transparency	6	6	9	21	17	3.63	1.285
4	Accountability checkmate low standard of purchase materials of contractors.	5	4	8	13	29	3.97	1.299

Source: Research Survey Data, (2024).

From table 4.11 in response to item one, respondents affirmed that public accountability enhance contractors confidence in bidding process. This is accounted for by the high mean score of 3.34. Similarly, it was agreed for the second item that public accountability enhance transparency. This is also confirmed by the high mean score of 3.44. Furthermore, the third item shows that their public accountability promotes transparency this is accounted for by the high mean score of 3.63. Finally, it was agreed for the last item that accountability checkmate low standard of purchase materials of contractors. This is also confirmed by the high mean score of 3.97.

Table 3.1 Correlation for the relationship between Tender evaluation and procurement efficiency

		Tender evaluation	Value for Money	Public Accountability
Spearman's rho	Tender evaluation	Correlation Coefficient	1.000	.890**
		Sig. (2-tailed)	.	.000
		N	130	130
	Value for Money	Correlation Coefficient	.890**	1.000
		Sig. (2-tailed)	.000	.000
		N	130	130
	Public Accountability	Correlation Coefficient	.636**	.846**
		Sig. (2-tailed)	.000	.000
		N	130	130

** . Correlation is significant at the 0.01 level (2-tailed).

Source: Research Data (2024) and SPSS output version 23.0

Table 3.1 illustrates the test for the two previously postulated bivariate hypothetical statements. The results show that for:

H₀₁: There is no significant relationship between Tender evaluation and value for money in the Rivers State government ministries

The correlation coefficient (r) shows that there is a significant and positive relationship between Tender evaluation and value for money. The ρ value 0.890 indicates this relationship and it is significant at $p < 0.000 < 0.05$. The correlation coefficient represents a high correlation indicating a very strong relationship. Therefore, based on empirical findings the null hypothesis earlier stated is hereby rejected and the alternate upheld. Thus, there is a significant positive relationship between tender evaluation and value for money in the Rivers State government ministries.

H₀₂: There is no significant relationship between Tender evaluation and public accountability in the Rivers State government ministries

The correlation coefficient (r) shows that there is a significant and positive relationship between tender evaluation and public accountability. The ρ value 0.636 indicates this relationship and it is significant at $p < 0.000 < 0.05$. The correlation coefficient represents a high correlation indicating a very strong relationship. Therefore, based on empirical findings the null hypothesis earlier stated is hereby rejected and the alternate upheld. Thus, there is a significant positive relationship between tender evaluation and public accountability in the Rivers State government ministries.

Discussion of Findings

The relevance of Carters '10 Cs', Bid evaluation theory was developed by Ray Cater in 1995 to help buyers determine the most suitable bidder who will be able to perform a contract or a tender that is awarded by providing wide range of criteria to evaluate and rank bidders. Businesses have an obligation to maintain market efficiency. Bribery, bid rigging and collusion undermines market efficiency and leaves the entire market system open to change of immorality and illegitimacy. This study examines the relationship between tender evaluation and procurement efficiency in the Rivers State Government ministries. The findings revealed that there is a significant positive relationship between tender evaluation and procurement efficiency. This finding agrees with the study of Twesigye, Shadrack, Anita, Baker and Brian (2022) who examined the relationship between Bid evaluation practices and Contract performance in the Uganda Police Force (UPF). The study examined the three research objectives namely: relationship between bidder compliance and contract performance, relationship between technical evaluation of bidders and contract performance and lastly the relationship between financial evaluation of bidders and contract performance in UPF. The study adopted a cross sectional survey design and employed both quantitative and qualitative approaches in data collection and

analysis. The researcher used both primary and secondary data and analyzed data using Pearson correlation and multiple linear regression models. The results of the finding showed that there was a significant relationship between bid valuation practices under study and contract performance where by (bid compliance $r = .062$; $p < .802$) (technical evaluation $r = .349$; $p < .156$) and (financial evaluation $r = .074$; $p < .771$) respectively. The study concluded by mentioning that it's important for UPF to effectively conduct bid evaluation practices so as to enhance contract performance for effective service delivery. Although this study was done in Uganda, while ours was done in Nigeria. Hence, tender evaluation enhances procurement efficiency by reducing cost of Government spending, and enables economic growth.

Conclusion

Tender evaluation is a crucial part of the procurement process where a contracting authority systematically assesses competing bids to select the most economically advantageous tender, based on pre-defined criteria like technical merit, price, experience, and financial stability. The process involves checking compliance, evaluating technical capabilities and financial resources, scoring bids against established criteria with weightings, and conducting moderation to ensure fairness before a final contract is awarded. While, Procurement efficiency is a business term that refers to the ability of an organization to procure goods, services and works in a cost-effective manner. It is a measure of how well an organization is able to acquire the goods and services it needs to run its operations, while minimizing the costs associated with the process. Specifically, also and in line with the objectives of this study, the study concludes that and also found that tender evaluation enhances procurement efficiency in the Rivers State Government Ministries.

Recommendations

- i. Public Organizations in Rivers State should properly evaluate the tenders from vendors in order to ascertain the most suitable in terms of technical suitability, cost efficient and other capabilities.
- ii. Invest in training programs for procurement officials to enhance their skills and knowledge in areas such as contract management, negotiation, and risk assessment in order to improve transparency, accountability and reduce cost of Government spending.
- iii. There is need to enormously implement stringent procurement policies which encourage proper tendering processes in the Rivers State Government ministries.

Assessing the Influence of Community Participation on the Effectiveness of Community-Based Conflict Management in Delta State

IROGBO, Prosper Uyoyou

*Department of Sociology,
Faculty of the Social Sciences
Delta State University, Abraka*

Publication Date: 2025/11/28

Abstract

This research investigates how community participation influences the effectiveness of community-based conflict management in Delta State with a study focus on Ethiope East Local Government Area of Delta State. Guided by Social Capital Theory and Cultural Theory of Conflict, the study explores the extent to which trust, social relationships, and cultural norms shape grassroots conflict resolution. Data were generated from a random sample of 100 respondents using a structured questionnaire. Results show that inclusive participation, such as mediation by elders, family involvement, and community forums, plays a pivotal role in resolving disputes, promoting harmony, and reinforcing collective solidarity. However, the findings also highlight persistent obstacles, including inadequate resources, reluctance from disputants, and competition between indigenous mechanisms and the formal judicial system, which limit overall effectiveness. To address these issues, the study recommends stronger government engagement through capacity building, material support, and policy recognition of community-based approaches.

Keywords: *Community-Based Conflict Management (CBCM), Social Capital, Cultural Legitimacy*

Introduction

Community participation is increasingly seen as a vital element in effective conflict management, especially at the local level where disputes are deeply rooted in social and cultural realities (Curcija, Breakey & Driml, 2019). This shift away from state-driven, top-down approaches to a more locally-grounded, inclusive framework is based on the idea that peace is more sustainable when those directly affected by conflict are active participants in shaping the outcomes (Zimmermann et al., 2009; Akudugu & Mahama, 2011). Community-based conflict management (CBCM) approaches are designed to harness this participation by leveraging indigenous practices, collective decision-making, and the moral authority of local actors (Chinwokwu, 2015). The renewed interest in these methods stems from the limitations of formal, state-centric mechanisms, which are often inaccessible, under-resourced, or distrusted by communities (Augusty & Dizon, 2020). A key strength of participatory CBCM is that it fosters ownership, accountability, and long-term peace by enabling affected individuals and groups to voice their concerns and co-create solutions (Akande, Kaye & Rukuni, 2021). Empirical evidence from various global contexts, including Africa and Latin America, shows a direct link between community involvement and the success of peace initiatives (Nwaka, 2020; Ashindorbe, Afatakpa & Owonikoko, 2021). Participation also enhances cultural sensitivity

and inclusivity, as community-led processes reflect shared values and reduce the likelihood of elite capture, thereby broadening the space for marginalized voices like women and youth (Curcija, Breakey & Driml, 2019; Akudugu & Mahama, 2011). Despite the growing recognition of participatory peacebuilding, there is a lack of empirical research on how community participation shapes the effectiveness of CBCM in specific local contexts, particularly in Nigeria (Chinwokwu, 2015; Yimer, 2021). This gap is particularly significant in the Ethiope East Local Government Area of Delta State, where conflicts have historically stemmed from ethnic rivalries and resource disputes, and it remains unclear to what extent broader community participation strengthens or weakens traditional resolution efforts (Akande, Kaye & Rukuni, 2021). While much of the existing research in Nigeria focuses on top-down frameworks, this study aims to fill the gap by systematically assessing the influence of community participation on the effectiveness of CBCM in this specific context (Augusty & Dizon, 2020; Smidt, 2020). The research seeks to provide a practical understanding of how inclusive participation contributes to legitimacy, social trust, and compliance with conflict resolution outcomes in a localized setting.

Research Objectives

The main objective of this study is to assess the influence of community participation on the effectiveness of community-based conflict management in Delta State, Delta State. The specific objectives are to:

- i. identify the forms of community participation in community-based conflict management in Delta State;
- ii. examine the influence of community participation on the effectiveness of community-based conflict management in resolving disputes and fostering peace;
- iii. analyze the limitations affecting community participation in community-based conflict management processes

Research Questions

The main research question guiding this study is: How does community participation influence the effectiveness of community-based conflict management in Delta State? The specific research questions are:

- i. What are the forms of community participation in community-based conflict management in Delta State?
- ii. In what ways does community participation influence the effectiveness of community-based conflict management in resolving disputes?
- iii. What limitations affect community participation in community-based conflict management processes?

Significance of the Study

This study is significant because it fills a crucial gap in understanding how community participation shapes the effectiveness of community-based conflict management (CBCM) in Delta State. While CBCM has been widely acknowledged as a credible alternative to state-centric approaches, little empirical research has examined how the level, quality, and inclusiveness of participation influence outcomes in specific Nigerian contexts. By focusing on Ethiopia East, a multi-ethnic area with a history of communal disputes, this study provides context-specific evidence that contributes to both theory and practice in peacebuilding.

The findings will be valuable for policymakers seeking to strengthen community-driven conflict resolution mechanisms, as they will highlight practical ways of enhancing inclusive participation for sustainable peace. Practitioners and traditional institutions can also draw lessons on how to improve legitimacy, fairness, and acceptance of conflict resolution processes by involving diverse community groups such as women, youth, and minority stakeholders. For scholars, the research adds to the broader body of knowledge on participatory conflict management by offering empirical insights from a local Nigerian setting.

Scope of the Study

The scope of this study is limited to Delta State with special focus on Ethiopia East Local Government Area. The research will specifically focus on how community participation influences the effectiveness of community-based conflict management practices within this locality. The study will engage diverse categories of stakeholders, including community members, traditional leaders, elders, youth, women, grassroots organizations, and local authorities, in order to capture the breadth of participation in conflict management processes.

Although the primary focus is on community-driven approaches, in context, the study will also consider the perspectives of institutional actors such as the police and local government officials, to understand the extent of collaboration and support between formal structures and community-led mechanisms.

Review of Related Literature

The review of the literature and the theoretical framework that underpins the study on community-based conflict management approaches. This chapter then further contextualizes the study for the subsequent chapters. In line with this, the chapter will be organized along the following: Conflict Management and Communities, Community Participation, Effectiveness of Community Participation in CBCM, Community Participation and Social Cohesion in Conflict Management and Theoretical Framework

Concept of Conflict Management

Conflict Management and Communities

Conflict is an unavoidable aspect of human interaction, and in most societies, it arises from competition over scarce resources, social differences, political struggles, or competing interests. In African communities, particularly rural and semi-urban areas, conflicts have historically been addressed through locally grounded mechanisms that rely on community members, elders, and traditional institutions rather than on external authorities or formal courts. This process is widely known as community-based conflict management (CBCM). Community-Based Conflict Management (CBCM) is a localized approach to resolving disputes that relies on the active participation of community members, elders, and traditional institutions rather than formal state systems (Curcija, Breakey & Driml, 2019). This method views conflict as a social problem requiring dialogue and reconciliation rather than just legal adjudication (Chinwokwu, 2015). A key strength of CBCM is its participatory nature, which ensures that diverse groups, including women and youth, are involved, fostering collective responsibility and increasing compliance with agreements (Akanke, Kaye & Rukuni, 2021; Smidt, 2020). Another strength is its cultural relevance, as it utilizes familiar practices like rituals and storytelling that resonate

with local values, making resolutions more legitimate and binding (Nwaka, 2020; Ashindorbe, Afatakpa & Owonikoko, 2021). Its localized nature also allows for flexible strategies tailored to specific community contexts (Zimmermann et al., 2009).

Despite its strengths, CBCM is not without limitations and is often viewed as a complement to, rather than a replacement for, formal institutions (Akudugu & Mahama, 2011). Traditional processes may reinforce power imbalances by excluding marginalized groups (Akande, Kaye & Rukuni, 2021), and CBCM can be inadequate for large-scale conflicts involving external actors or state-level issues (Yimer, 2021). The lack of formal legal backing can also limit the enforceability of some outcomes (Saleh, 2020). However, recent innovations are addressing these challenges. Communities are now blending traditional practices with modern tools and incorporating technology to enhance transparency and participation (Chinwokwu, 2015; Yimer, 2021). The effectiveness of CBCM is ultimately dependent on the quality of participation—when it is broad and meaningful, resolutions are more likely to be fair, legitimate, and enduring.

Community Participation

Community participation is the cornerstone of community-based conflict management (CBCM), ensuring that individuals and groups are actively involved in problem-solving and decision-making (Bukari, 2023). This engagement gives legitimacy and sustainability to conflict resolution practices because it allows those affected by disputes to have a voice, making outcomes more likely to align with local values (Gilboa & Weiss-Gal, 2022). Without meaningful participation, conflict management risks being imposed from above, lacking the trust and ownership needed for lasting peace. Historically, traditional actors like elders and chiefs have been central to this process, their authority rooted in cultural recognition and a moral role as custodians of tradition (Marchetti & Tocci, 2020; Fisher et al., 2020). However, modern society has seen an evolution in participation to include a broader range of actors, such as civil society groups, women leaders, and youth organizations (Smidt, 2020), blending traditional legitimacy with contemporary inclusiveness.

The range of community actors involved in conflict resolution is diverse and context-specific. In many communities, traditional leaders rely on custom, while religious leaders use their moral authority to encourage reconciliation (Bodin, Mancilla-García & Robins, 2020; Musavengane & Kloppers, 2020). In places like Ethiopia East Local Government Area, this includes a blend of traditional leaders, local government officials, and civil society organizations (Bukari, 2023; Gilboa & Weiss-Gal, 2022). Additionally, institutional actors like the Nigeria

Police may collaborate with community structures, bridging the gap between informal practices and state authority (Väyrynen, 2023; Ibrahim et al., 2022). This multi-layered approach ensures resolutions are not only culturally sensitive but also align with national law. Ultimately, the effectiveness of CBCM depends on the quality of participation—whether it is inclusive and represents diverse groups. When participation is broad and meaningful, resolutions are more likely to be accepted and durable; conversely, when it's narrow or dominated by a few elites, peace is likely to be short-lived (Bukari, 2023).

Effectiveness of Community Participation in Community Based Conflict Management

The effectiveness of Community-Based Conflict Management (CBCM) is directly tied to the level of community participation. CBCM, which utilizes locally defined and culturally embedded approaches to disputes, gains its effectiveness from its accessibility and ability to foster collective ownership (Curcija, Breakey & Driml, 2019). The most critical factor is inclusiveness in participation, as outcomes are more legitimate and durable when a wide range of actors—including women, youth, and religious leaders—are involved (Yimer, 2021). When conflict resolution is monopolized by a few elites, decisions lack legitimacy and may face resistance (Bukari, 2023). Cultural legitimacy is also crucial; people are more likely to accept resolutions that align with their traditions and norms (Akudugu & Mahama, 2011), although this must be balanced with inclusivity to avoid perpetuating inequalities (Nwaka, 2020). The timeliness and accessibility of CBCM, which are often faster than formal legal systems, also contribute to its perceived effectiveness (Smidt, 2020; Gilboa & Weiss-Gal, 2022).

Despite these strengths, the effectiveness of CBCM can be undermined by internal biases and inequalities that affect participation. Traditional structures often privilege men and elders, sidelining marginalized groups whose perspectives are critical for sustainable outcomes (Akande, Kaye & Rukuni, 2021; Marchetti & Tocci, 2020). Additionally, the lack of formal legal backing can limit the enforceability of resolutions, especially in disputes with trans-local dimensions (Saleh, 2020; Adedayo, 2020). However, recent innovations are strengthening CBCM effectiveness. Hybrid models are blending traditional practices with modern participatory frameworks to ensure both cultural relevance and inclusivity (Zimmermann et al., 2009). The use of technology and capacity-building initiatives are also expanding participation and improving transparency, making resolutions more credible and sustainable (Chinwokwu, 2015; Augusty & Dizon, 2020; Yimer, 2021; Demchuk et al., 2024).

Community Participation and Social Cohesion in Conflict Management

Community participation is crucial for peacebuilding and conflict management, particularly where state institutions are weak. It goes beyond mere inclusion, fostering a sense of collective ownership and accountability (Pretty, 1995; Bukari, 2023). In the context of community-based conflict management (CBCM), participation involves the active engagement of diverse stakeholders, including men, women, youth, elders, and civic groups, in identifying disputes and implementing resolutions (Chambers, 1997; Yimer, 2021). This bottom-up approach is effective because those most affected by conflicts are best suited to articulate their needs and sustain peace agreements (Moyo & Anning, 2020). By fostering social cohesion and building relationships, participatory methods create a sense of shared responsibility that leads to greater legitimacy and voluntary compliance with resolutions (Chan, To & Chan, 2006; Ebubedike et al., 2023). This sense of collective ownership is key to ensuring that outcomes are viewed as products of the community's own input, rather than external impositions, thereby reducing the likelihood of non-compliance (Lamidi, 2021; Gilboa & Weiss-Gal, 2022).

However, there are challenges to effective participation. Tokenism, where participation is superficial without real influence, can lead to disillusionment (Pretty, 1995). Power dynamics can also distort the process, as elders or powerful individuals may dominate discussions, silencing the voices of women, youth, and marginalized groups (Akande, Kaye & Rukuni, 2021; Ibrahim et al., 2022). Additionally, conflict fatigue can lead to apathy, hindering deep engagement in protracted disputes (Väyrynen, 2023). Despite these challenges, modern approaches are evolving. Hybrid models are emerging that combine traditional practices with modern frameworks, ensuring inclusivity and human rights (Zimmermann et al., 2009; Musavengane & Kloppers, 2020). These models, often supported by NGOs, build local capacity for dialogue and negotiation, empowering communities to manage future conflicts and increasing the effectiveness of CBCM initiatives (Curcija, Breakey & Driml, 2019; Demchuk et al., 2024).

Theoretical Framework

The study is further understood by the social capital theory developed by Pierre Bourdieu and cultural theory of conflict by Mary Douglas. These theories are taken as the framework upon which the study is theorized.

Social Capital Theory

Social capital theory offers a valuable framework for understanding how community participation influences the effectiveness of community-based conflict management (CBCM). Rooted in the works

of Pierre Bourdieu (1986), James Coleman (1988), and Robert Putnam (1993), the theory highlights how networks, trust, and norms serve as valuable assets for both individuals and communities (Gannon & Roberts, 2020). The strength of social ties, whether bonding (within groups), bridging (across groups), or linking (with institutions), directly impacts a community's ability to manage conflict (Lang & Hornburg, 1998; Perkins, Hughey & Speer, 2002). In places like Ethiopia's East Local Government Area (LGA), the density of these networks and the embedded trust are crucial for negotiating and resolving disputes, as trust itself reduces negotiation costs and enhances cooperation (Falk & Kilpatrick, 2000).

The theory also clarifies that participation in CBCM is not just about presence but about the quality of involvement, inclusivity, and ownership over outcomes (Zimmermann et al., 2009). While strong bonding capital can foster solidarity, it can also entrench divisions, making bridging capital essential for multi-ethnic communities to facilitate dialogue across diverse groups (Akudugu & Mahama, 2011; Yimer, 2021). Linking capital, or connections with external institutions like government agencies, further enhances CBCM by providing support for enforcement and access to resources (Adedayo, 2020; Bukari, 2023). However, the theory also warns that social capital can be unequally distributed, reinforcing power imbalances and potentially undermining inclusivity and sustainability (Marchetti & Tocci, 2020; Ibrahim et al., 2022). Therefore, cultivating balanced social capital—nurturing bonding, bridging, and linking ties—is crucial for ensuring that CBCM processes are just, legitimate, and resilient (Musavengane & Kloppers, 2020).

Cultural Theory of Conflict

The cultural theory of conflict, drawing on anthropology and sociology, argues that cultural norms and values significantly influence how conflicts emerge and are resolved. According to this framework, developed by scholars such as Clifford Geertz (1973) and Mary Douglas (MacDonald, 2009), disputes are never value-neutral but are instead shaped by culturally specific ideas of justice, order, and relationships. Edward T. Hall and Kevin Avruch further posited that conflict dynamics are inseparable from their cultural context, as culture dictates how grievances are framed and how reconciliation is pursued (Avruch & Black, 1987; Ross, 1986). Different cultures have distinct understandings of what constitutes a conflict, who has the authority to resolve it, and what a satisfactory resolution entails (Gibson & McDaniel, 2010). This theory highlights that the effectiveness of conflict resolution depends on its alignment with culturally defined notions of legitimacy and justice.

When applied to community-based conflict management (CBCM), the cultural theory reveals

that culture acts as a gatekeeper of participation. Cultural norms determine who can speak and mediate disputes, often privileging elders and chiefs while marginalizing women and youth (Chinwokwu, 2015). The theory also underscores the importance of cultural symbols and rituals in fostering trust and embedding resolutions within the community's moral fabric, transforming agreements into socially binding commitments (Avruch & Black, 1987). However, it also points to the risks of cultural exclusivity, where norms can reinforce inequalities and silence marginalized voices, potentially undermining the long-term effectiveness of resolutions (Nwaka, 2020; Ibrahim et al., 2022). In multi-ethnic societies, cultural pluralism can complicate conflict resolution when groups hold divergent notions of justice, necessitating culturally inclusive and adaptable approaches (Zimmermann et al., 2009; Demchuk et al., 2024). Ultimately, the theory emphasizes that meaningful participation and lasting conflict resolution require a deep understanding of the cultural context.

Methodology

Research Design

The study adopts a quantitative research design with a survey approach. This design is considered appropriate because it allows for the collection of standardized data from a relatively large sample of respondents, thereby enabling statistical analysis and interpretation.

Study Area

The study is conducted in Delta State comprised of three (3) senatorial Districts (Delta North, Delta Centra, and Delta South) but the focus is on Delta Central which is made up of eith (8) local government authorities of which the special focus is on Ethiope East Local Government Area of the State, Nigeria, situated in the southern part of the country within the Niger Delta region. The LGA covers an approximate landmass of 283 square kilometers, with Isiokolo serving as the administrative headquarters. Geographically, Ethiope East is bordered by Ukwuani LGA to the north, Ethiope West LGA to the west, and Ughelli North LGA to the east. Its location makes it a strategic administrative and cultural corridor connecting several communities across Delta State.

The area is characterized by a blend of tropical rainforest and riverine ecology, with the River Ethiope serving as its most prominent natural feature. The River Ethiope, one of the cleanest inland waters in Africa, originates from Umuaja in Ukwuani and flows through Abraka, where it forms a major ecological and tourism attraction. The river sustains local fishing, irrigation, and eco-tourism activities, while also playing an important role in the social and cultural life of the people. The area experiences a humid tropical climate, marked by two distinct

seasons: the rainy season (April to October) and the dry season (November to March), with an annual rainfall of about 2,000mm and an average temperature ranging between 25°C and 32°C. These climatic conditions support the rich agricultural productivity of the area. In terms of demography, Ethiope East had a recorded population of about 112,000 people in the 2006 national census, with projections indicating significant growth over the past two decades. The population is largely composed of the Urhobo ethnic group, who are the indigenous inhabitants of the area. However, due to the presence of Delta State University in Abraka and other economic opportunities in towns like Eku and Okpara, there is also a visible population of non-indigenous residents, including Igbo, Yoruba, and Hausa migrants who contribute to local commerce and service industries.

The population structure reflects a high proportion of young people, which has implications for both development opportunities and conflict dynamics, particularly in relation to youth unemployment and social unrest. Economically, Ethiope East thrives predominantly on agriculture, trading, and education. The fertile soil and favorable climatic conditions support large-scale farming of cassava, yam, maize, and plantain, while oil palm and rubber plantations provide important cash crops. Towns like Okpara and Ovu are agrarian centers, contributing significantly to food production and local trade. Abraka stands out as the commercial and educational hub of the LGA, hosting Delta State University, which attracts thousands of students and academic staff from across Nigeria. This has stimulated small and medium-scale businesses, hospitality services, and transportation networks in the town. Eku, another significant town, is renowned for the historic Eku Baptist Hospital, which for decades served as one of the foremost missionary hospitals in Nigeria and continues to function as a regional healthcare center.

The cultural life of Ethiope East is rich and diverse, largely shaped by the traditions of the Urhobo people. The area is known for colorful festivals such as the annual Ohworu festival in Abraka and the Iyerin festival in Okpara, both of which are rooted in communal spirituality, identity, and social cohesion. Music, dance, folklore, and traditional cuisines also form integral aspects of community life.

Importantly, traditional institutions such as the Ovie (traditional ruler), council of chiefs, and village elders play pivotal roles in governance, dispute resolution, and the preservation of cultural heritage. These institutions remain central to conflict management, as they embody authority, legitimacy, and continuity in the eyes of the people. In terms of governance, Ethiope East operates as one of the 25 LGAs in Delta State, with an elected chairman and councilors constituting the local government council. The council is responsible for providing basic services such as primary education, healthcare,

sanitation, and local security in collaboration with state and federal agencies. However, like many LGAs in Nigeria, Ethiopia East faces challenges such as inadequate infrastructure, limited access to quality healthcare in rural areas, and persistent unemployment among young people. These socio-economic challenges contribute to periodic conflicts within communities, including land disputes, chieftaincy tussles, youth restiveness, and inter-communal disagreements.

Study Population

The study population comprises the estimated 112,000 residents of Ethiopia East LGA, as recorded in the 2006 census. However, the focus is not on the general population but on stakeholders who are directly or indirectly involved in community-based conflict management. These include community leaders, traditional rulers, youth leaders, women leaders, local authorities, community members, and representatives of security institutions such as the Nigeria Police. This diverse group of participants is targeted to ensure a comprehensive understanding of how community participation shapes the effectiveness of conflict management strategies.

Sampling Technique and Sample Size

A simple random sampling technique is employed to ensure fairness in the selection of respondents and to reduce bias. The sampling frame is derived from population data obtained from the LGA secretariat at Isiokolo. Randomization allows each member of the target population an equal chance of being included in the study. The sample size was determined using Taro Yamane's formula: $n = \frac{N}{1 + N(e)^2}$, where N signifies the population being studied, e = *significant error margin* while 1 = **Constant**, and n as the sample size. Given the values are known where, $N=112,000$ and $e= 0.5$, the procedure can be calculated as follows;

$$n = 112,000 / 1 + 112,000 (0.5)^2$$

$$n = 112,000 / 1 + 112,000 \times 0.0025$$

$$n = 112,000 / 1 + 280$$

$$n = 112,000 / 281$$

$$n = 398.5765$$

However, given the cost implication of absorbing a sample of this size into the study, a $\frac{1}{4}$ of ' n ' will be taken to lessen the cost burden. Hence

$$n = \frac{1}{4} \times 398.5765$$

$$n = 99.64$$

$$n = 100 \text{ (Rounded Off)}$$

Then adopting a simple random sampling, the list of names were shuffled and with an interval of 1110, a total of 100 respondents were respondents were arrived at.

Method of Data Collection

Data for this study were collected through the use of a structured questionnaire, which served as the main research instrument. The first section, Section A, focused on demographic information. Here, questions were included to gather data on the age, gender, educational attainment, occupation, and length of residency of respondents in Ethiopia East. The second section, Section B, was developed to address the first research objective, which sought to identify the forms of community participation in community-based conflict management within the study area. Section C corresponded to the second research objective, which was to examine the influence of community participation on the effectiveness of community-based conflict management. To measure the strength of these perceptions, a five-point Likert scale was employed, ranging from "Strongly Agree" to "Strongly Disagree." The fourth section, Section D, was tailored to the third research objective, which aimed to analyze the limitations affecting community participation in community-based conflict management processes. This section contained questions that addressed potential barriers.

Method of Data Analysis

Data analysis employs descriptive statistics, including tables, frequency counts, and percentages, to summarize and interpret the survey responses. Results are presented thematically, aligning with the research objectives and findings from the descriptive statistics. This thematic presentation helps in organizing the data into coherent categories for further analysis. The discussion then connects these findings to existing literature and the theoretical framework guiding the study. By linking the results back to relevant theories and prior research, the analysis aims to provide a well-rounded understanding of community participation and conflict resolution in East Local Government.

RESULT AND DISCUSSION

Data Presentation, Analysis and Interpretation

This section focuses on the analysis of data gathered from field, interpretation and presentation of results.

Table 4.1 Analysis of Socio-Demographics

Item	Options	Frequency (n)	Percentage (%)	Mean Score
Sex	Male	52	52%	0.52
	Female	48	48%	0.48
Age Group	Below 20	12	12%	0.12
	20–29	28	28%	0.28

	30–39	26	26%	0.26
	40–49	18	18%	0.18
	50 and above	16	16%	0.16
Occupation	Farmer	18	18%	0.18
	Trader	32	32%	0.32
	Civil Servant	20	20%	0.20
	Artisan	14	14%	0.14
	Other	16	16%	0.16
Educational Level	No Formal Education	8	8%	0.08
	Primary	22	22%	0.22
	Secondary	38	38%	0.38
	Tertiary	32	32%	0.32
Residency	Urban	58	58%	0.58
	Rural	42	42%	0.42
Total		100	100%	1.00

Source: Researcher's compilation, 2025

Gender distribution shows a relatively balanced sample, with males making up 52 percent and females 48 percent. This balance is significant for the study since both genders contribute differently to conflict management processes: men often dominate formal and traditional leadership roles, while women play critical roles in grassroots mobilization, peace advocacy, and informal dispute resolution. The age distribution indicates that the most represented group is between 20–29 years (28 percent), followed closely by the 30–39 group (26 percent). Together, these categories make up more than half of the respondents, emphasizing the central role of youth and middle-aged adults in conflict dynamics. Younger respondents (below 20 years, 12 percent) reflect emerging participation, often as witnesses or indirect actors, while older respondents aged 50 and above (16 percent) remain important custodians of traditions, providing wisdom and legitimacy in conflict resolution. Occupationally, traders dominate with 32 percent, followed by civil servants (20 percent) and farmers (18 percent). This suggests that economic activities tied to commerce and agriculture are central to community stability, as disputes often arise around market interactions, land, and resource

use. Artisans (14 percent) and those in other occupations (16 percent) bring additional perspectives, highlighting the breadth of community involvement across different economic sectors. Educational levels show that the majority of respondents have secondary education (38 percent), followed by tertiary education (32 percent). This indicates that most participants have sufficient literacy to engage in structured dialogue, documentation, and organized conflict resolution processes. However, the 30 percent combined share of respondents with only primary or no formal education underscores the persistence of informal and oral mechanisms in conflict resolution, ensuring accessibility to all members regardless of literacy level. Residency patterns reveal that 58 percent of respondents live in urban centers such as Abraka and Eku, while 42 percent reside in rural areas like Okpara and Ovu. This distribution reflects the duality of Ethiopia East, where urban dwellers may be exposed to formal conflict management systems, while rural dwellers rely more on traditional institutions and communal values. This blend offers a holistic understanding of how community participation is influenced by location and exposure.

Table 4.2 Forms of Community Participation in Conflict Management

Item	Options	Frequency (n)	Percentage (%)	Mean Score
Awareness of community participation in conflict management	Yes	88	88%	0.88
	No	12	12%	0.12
Total		100	100%	1.00
Forms of participation observed	Elders/Chiefs mediation	62	62%	0.62
	Youth group involvement	55	55%	0.55
	Women's associations	48	48%	0.48
	Religious leaders	42	42%	0.42
	Vigilante groups	36	36%	0.36
	Local government/police	28	28%	0.28

	support			
Total		100	100%	1.00

	Occasionally	34	34%	0.34
	Often	38	38%	0.38
	Always	16	16%	0.16
Total		100	100%	1.00
Are cultural norms/customs considered in participation?	Yes	87	87%	0.87
	No	13	13%	0.13
Total		100	100%	1.00

Source: Author's Field Survey, 2024

The findings reveal that community participation in conflict management is a widely recognized practice in Ethiopia East, with 88 percent of respondents (mean = 0.88) acknowledging its existence. Only 12 percent reported being unaware of such practices, underscoring the embedded nature of participatory conflict management in the area. Among the forms of participation, elders and chiefs play the most dominant role, as reported by 62 percent of respondents (mean = 0.62). This reflects their traditional authority and legitimacy in resolving disputes, often through dialogue and mediation. Youth groups were also widely acknowledged (55 percent, mean = 0.55), highlighting their role in either preventing violence or mobilizing collective responses to conflicts. Women's associations (48 percent, mean = 0.48) emerged as vital actors, especially in promoting reconciliation and advocating non-violent approaches to dispute resolution. Religious leaders (42 percent, mean = 0.42) were recognized as trusted mediators, often leveraging moral authority to influence disputing parties. Vigilante groups (36 percent, mean = 0.36) were reported to play a complementary role,

particularly in maintaining order and preventing escalation into violence. Meanwhile, formal institutions such as the police and local government representatives were mentioned by 28 percent (mean = 0.28), suggesting that although present, their roles are less dominant compared to indigenous mechanisms. In terms of frequency, 38 percent of respondents indicated that community participation occurs often, while 34 percent said it happens occasionally. A smaller proportion, 16 percent, reported that these practices are always employed, while 12 percent described them as rare. This distribution suggests that although community involvement is widespread, its intensity varies depending on the nature and scale of disputes. Finally, 87 percent of respondents (mean = 0.87) affirmed that cultural norms and customs are considered during conflict management processes. This reflects the reliance on indigenous values, communal identity, and customary laws as the foundation for resolving disputes. Only 13 percent reported otherwise, which may reflect the growing influence of formal, statutory mechanisms in some areas.

Table 4.3 Analysis of the Influence of Community Participation on Effectiveness

Item	Options	Frequency (n)	Percentage (%)	Mean Score
How effective is community participation in resolving disputes?	Not Effective	8	8%	0.08
	Moderately Effective	32	32%	0.32
	Highly Effective	60	60%	0.60
Total		100	100%	1.00
Outcomes achieved through participation	Reduction of recurring disputes	68	68%	0.68
	Fairness in resolution process	55	55%	0.55
	Satisfaction with outcomes	50	50%	0.50
	Restoration of peace	72	72%	0.72
Total		100	100%	1.00

Do you believe community participation makes conflict resolution sustainable?	Yes	83	83%	0.83
	No	17	17%	0.17
Total		100	100%	1.00
Level of community trust in participatory methods	Low	12	12%	0.12
	Moderate	38	38%	0.38
	High	50	50%	0.50
Total		100	100%	1.00

Source: Author's Field Survey, 2024

The results indicate that community participation is widely perceived as enhancing the effectiveness of conflict management in Ethiopia East. A majority of respondents (60%, mean = 0.60) rated participation as highly effective, while 32% considered it moderately effective, and only 8% viewed it as ineffective. Regarding outcomes, the most reported benefit of community participation was the restoration of peace (72%, mean = 0.72), followed closely by the reduction of recurring disputes (68%, mean = 0.68). Fairness in the resolution process (55%, mean = 0.55) and satisfaction with outcomes (50%, mean = 0.50) were also acknowledged, showing that participatory approaches not only

resolve conflicts but also build legitimacy and acceptance of resolutions. On sustainability, 83% of respondents (mean = 0.83) agreed that community involvement makes conflict management more enduring, while 17% expressed doubt. This suggests strong confidence in participatory mechanisms as long-term solutions. Finally, levels of trust in participatory methods were rated high by half of the respondents (50%, mean = 0.50), moderate by 38%, and low by 12%. This demonstrates that while confidence in participation is generally strong, some reservations remain, likely reflecting occasional disputes over fairness or inclusivity.

Limitations Affecting Community Participation in Conflict Management

Source: Author's Field Survey, 2024

Item	Options	Frequency (n)	Percentage (%)	Mean Score
What challenges hinder participation in conflict management?	Inadequate resources	65	65%	0.65
	Political interference	52	52%	0.52
	Weak institutional support	48	48%	0.48
	Exclusion of women and youth	35	35%	0.35
	Cultural biases	28	28%	0.28
	Lack of trust in formal institutions	22	22%	0.22
Total		100	100%	1.00
Do you think younger generations actively support these methods?	Yes	55	55%	0.55
	No	45	45%	0.45
Total		100	100%	1.00
How can these challenges be addressed?	Greater government support	62	62%	0.62
	Capacity building for community actors	50	50%	0.50
	Inclusion of women and youth	40	40%	0.40
	Awareness campaigns	30	30%	0.30
Total		100	100%	1.00

The findings indicate that community participation in conflict management faces significant constraints in Ethiopia East. The most pressing challenge identified was inadequate resources (65%, mean = 0.65), followed by political interference (52%, mean = 0.52) and weak institutional support (48%, mean = 0.48). Social issues such as exclusion of women and youth (35%) and cultural biases (28%) were also reported as barriers, while 22% of respondents cited lack of trust in formal institutions as an additional limitation. Regarding generational attitudes, a slight majority (55%, mean = 0.55) agreed that younger generations support community-based methods, but 45% felt otherwise, suggesting intergenerational differences in perceptions of traditional approaches. Proposed solutions to address these limitations centered on stronger government support (62%), capacity building for community actors (50%), and deliberate inclusion of women and youth (40%). Awareness campaigns (30%) were also highlighted as a strategy for strengthening acceptance and participation.

Discussion of Findings

The results suggest that community participation in conflict management is both widespread and diverse, involving community leaders, family or clan representatives, and traditional councils, with processes often guided by local customs and norms. This supports the cultural theory of conflict, which emphasizes that dispute resolution is most effective when rooted in culturally accepted practices. It also affirms the social capital perspective, as these practices rely on trust, reciprocity, and close social networks. The involvement of multiple actors indicates that conflict resolution in Ethiopia East is not an isolated effort but rather a collective responsibility, reinforcing the argument that participation is central to the legitimacy and sustainability of local peace initiatives. Community participation was found to enhance both the outcomes and the credibility of conflict management. Disputes resolved through traditional structures not only achieve settlements but also strengthen social ties and reinforce a sense of community belonging. This finding aligns with social capital theory, which links active participation and trust-building to cooperative outcomes. It also resonates with the cultural theory of conflict, as the reliance on customs ensures that solutions are perceived as fair and legitimate. Taken together, these insights indicate that when communities actively participate in conflict resolution, the process is more likely to foster peace, reduce recurrence, and promote long-term cohesion.

Despite these strengths, participation is constrained by challenges such as inadequate resources, political interference, exclusion of certain groups, and declining

influence of traditional authority. These limitations complicate the ideal picture painted by social capital theory, showing that trust and cooperation can be unevenly distributed, with some groups more included than others. Similarly, cultural theory helps explain both the strengths and weaknesses of community-based conflict management: while cultural traditions legitimize the process, they also reinforce biases that marginalize women, youth, and dissenting voices. The findings therefore highlight that participation, though effective, is not without vulnerabilities, and addressing these requires institutional support, inclusivity, and adaptation to changing social contexts.

Summary, Conclusion and Recommendations

Summary

This study assessed the influence of community participation on the effectiveness of community-based conflict management (CBCM) in Ethiopia East Local Government Area. The findings revealed that participation is expressed through various community structures, including traditional councils, elders, women's associations, and youth groups. These practices are rooted in local customs and norms, relying on culturally sanctioned mediation and arbitration to settle disputes. The reliance on local traditions ensures that conflict resolution is not just a social necessity but also a continuation of cultural heritage.

The study also found that community participation significantly enhances the effectiveness of conflict management. Active involvement leads to peaceful settlements, restores relationships, and strengthens community ties. Participation fosters fairness by directly involving community members in shaping resolutions, which reduces perceptions of bias. The sustainability of these outcomes is affirmed by the community's trust in these traditional methods. However, the study identified several limitations, including inadequate resources, political interference, and cultural biases that restrict the involvement of women and youth. Despite these challenges, the findings suggest that CBCM can remain relevant through continued support and adaptation.

Conclusion

This study has shown that community participation is central to the effectiveness of conflict management in Ethiopia East. Traditional actors such as elders, family representatives, and local councils provide culturally grounded mechanisms that ensure fairness, legitimacy, and sustainability in resolving disputes. Active participation not only reduces recurring conflicts but also strengthens social cohesion and peace within the community. However, limitations such as inadequate resources, political interference, and exclusion of certain groups remain significant barriers. Addressing

these challenges through institutional support and inclusivity is crucial for enhancing the long-term effectiveness of community-based conflict management.

Recommendations

Given the findings from this study then, the following recommendations are provided:

- i. To strengthen the forms of community participation, there should be deliberate inclusion of women, youth, and marginalized groups in conflict management processes to broaden representation and legitimacy.
- ii. To improve the effectiveness of community-based conflict management, local authorities and civil society should provide structured support, such as training and resources, for traditional actors to enhance fairness and sustainability in dispute resolution.
- iii. To address limitations to participation, stronger collaboration between community institutions and formal governance structures is needed, with clear policies to reduce political interference and reinforce trust in traditional mechanisms.

Abstract

This study examined the effect of blockchain technology on the business performance of selected manufacturing firms in Delta State, Nigeria. The specific objectives were to evaluate the effect of blockchain transparency, traceability, security, and data integrity on business performance. A total of 150 questionnaires were distributed, out of which 140 were correctly completed and analyzed using descriptive statistics and multiple regression analysis with the aid of SPSS. Qualitative data were also obtained through interviews with management staff to provide deeper insights into blockchain adoption practices. The findings revealed that blockchain transparency, traceability, security, and data integrity each exert a positive and significant influence on business performance. Among these variables, blockchain security had the strongest effect, followed by data integrity, transparency, and traceability. The study further showed that blockchain implementation enhances operational efficiency, strengthens supply chain visibility, safeguards data, and improves organizational trust and accountability. The study concludes that blockchain technology significantly improves the business performance of manufacturing firms by promoting secure, transparent, and efficient operations. It recommends that firms should invest in blockchain infrastructure, build employee capacity, and integrate blockchain systems into supply chain operations while government and regulatory bodies should develop clear policies to encourage widespread adoption. The research contributes to knowledge by providing empirical evidence on the role of blockchain dimensions—transparency, traceability, security, and data integrity—in enhancing the performance of manufacturing firms within a developing economy context. The study also offers practical insights for managers and policymakers on leveraging blockchain for industrial competitiveness and sustainability.

Keywords: Blockchain Technology, Business Performance, Transparency, Traceability, Security, Data Integrity, Manufacturing Firms, Delta State, Nigeria.

Introduction

Blockchain technology has emerged as a transformative force across various industries, offering solutions that enhance transparency, traceability, security, and data integrity. In the manufacturing sector, these attributes are pivotal in optimizing operations and improving business performance. This study delves into the impact of blockchain technology, focusing on its facets of transparency, traceability, security, and data integrity, on the business performance of selected manufacturing firms in Delta State, Nigeria. The manufacturing industry is a cornerstone of economic development, contributing significantly to employment and GDP. However, it faces challenges such as supply chain inefficiencies, counterfeit products, and data breaches, which can impede performance (Azzi, et al 2019). Blockchain technology, with its decentralized

and immutable ledger system, offers potential solutions to these issues. By recording transactions across a distributed network, blockchain ensures that data is transparent, traceable, and secure, thereby enhancing operational efficiency and trust among stakeholders (Casino, et al 2019).

Transparency in manufacturing processes is crucial for building trust with consumers and partners. Blockchain's decentralized ledger records all transactions in a manner that is accessible and verifiable by all authorized participants (Dai & Vasarhelyi, 2017). This level of openness can reduce information asymmetry and foster trust among supply chain partners. For instance, a study highlighted that by using a distributed ledger system, all transactions are recorded and can be accessed by anyone on the

network, helping to reduce corruption, fraud, and other illegal activities (Dobrovnik, et al, 2018).

Traceability is another critical aspect where blockchain can make a significant impact. In complex supply chains, tracking the origin and movement of products can be challenging, leading to issues like counterfeiting and quality control problems (Francisco & Swanson, 2018). Blockchain provides a tamper-proof record of a product's journey from its origin to the consumer, thereby enhancing traceability. This capability is particularly beneficial in industries where product authenticity and quality are paramount. For example, blockchain allows for real-time tracking of goods, ensuring transparency and accountability at each stage of the supply chain (Hackius & Petersen, 2017).

Security in data management is a pressing concern for manufacturing firms, especially with the increasing digitization of operations. Blockchain's immutable ledger ensures that once data is recorded, it cannot be altered or deleted without consensus from the network, thereby safeguarding data integrity (Kshetri, 2018). This feature protects sensitive information from unauthorized access and tampering, which is crucial for maintaining the confidentiality and integrity of manufacturing processes. Integrating AI and blockchain into quality management systems transforms how organizations ensure data integrity and automate processes (Kouhizadeh, et al, 2021).

Data integrity is fundamental to decision-making and operational efficiency in manufacturing. Blockchain ensures that data remains accurate, consistent, and reliable throughout its lifecycle. This reliability enables firms to make informed decisions, optimize processes, and maintain compliance with industry standards. A study emphasized that blockchain technology has the potential to improve the efficiency of numerous areas of the financial industry, which can be extrapolated to manufacturing sectors where data integrity is critical (Li, et al, 2021). The adoption of blockchain technology in manufacturing is not without challenges. Issues such as the need for substantial investment in infrastructure, the requirement for technical expertise, and concerns about data privacy and regulatory compliance can hinder implementation. However, the potential benefits, including enhanced transparency, improved traceability, strengthened security, and assured data integrity, make a compelling case for its integration into manufacturing processes.

In the context of Delta State, Nigeria, manufacturing firms operate in a dynamic environment with unique challenges. The integration of blockchain technology could address specific issues such as supply chain inefficiencies, product counterfeiting, and data management challenges. By enhancing transparency and traceability, firms can build trust with consumers and partners, leading to improved market

competitiveness. Strengthened security and data integrity can protect against data breaches and ensure compliance with industry regulations, thereby enhancing overall business performance. Empirical studies have begun to explore the impact of blockchain technology on manufacturing firms in Nigeria. For instance, a study of Chukwu, et al (2024), investigated materials management and the adoption of blockchain technology on supply chain efficiency in Nigerian Breweries Plc Ama, Enugu. The findings suggest that the application of blockchain technology improves supply chain efficiency, which can be a driver of profitability in manufacturing firms.

Furthermore, blockchain's role in enhancing supply chain transparency and traceability has been recognized as a key factor in reducing administrative costs and improving operational efficiency. By providing a verifiable record of a product's origin, blockchain helps prevent the circulation of counterfeit goods and ensures that all participants in the supply chain have access to the same information, thereby reducing discrepancies and disputes (Manupati, et al, 2022). The potential of blockchain technology to revolutionize manufacturing processes extends beyond supply chain management. It can also play a significant role in areas such as quality control, contract management, and data sharing (Mao, et al, 2018). For example, in quality control, blockchain can establish tamper-proof records, boosting consumer confidence in the products. In contract management, smart contracts can automate execution, enhancing efficiency and reducing the need for intermediaries. Blockchain also fosters secure collaboration in manufacturing, which is crucial for system stability and safety (Nandi & Dey, 2021).

Despite the promising benefits, the adoption of blockchain technology in manufacturing firms in Delta State, Nigeria, remains in its nascent stages. Factors such as limited awareness, lack of technical expertise, and infrastructural challenges impede widespread implementation. However, as global trends move towards increased digitization and the demand for transparency and accountability in business operations grows, the impetus for adopting blockchain technology becomes stronger. Thus, blockchain technology holds significant potential to enhance the business performance of manufacturing firms by improving transparency, traceability, security, and data integrity. While challenges to adoption exist, the benefits offer a compelling case for integration into manufacturing processes. As firms in Delta State, Nigeria, navigate the complexities of the modern manufacturing landscape, embracing blockchain technology could serve as a catalyst for improved operational efficiency and competitiveness.

The Problem

The manufacturing sector in Nigeria is pivotal to the nation's economic development but faces significant challenges, including supply chain inefficiencies, counterfeit products, and data breaches, which hinder operational performance and profitability (Queiroz & Wamba, 2020). Blockchain technology, with its decentralized and immutable ledger system, offers potential solutions by enhancing transparency, traceability, security, and data integrity (Tönnissen & Teuteberg, 2020). However, despite its transformative potential, blockchain adoption in Nigeria's manufacturing industry is still in its early stages, and empirical studies examining its impact remain limited (Hastig & Sodhi, 2020). While blockchain's potential benefits are widely discussed, there is a scarcity of empirical studies focusing on its application within Nigeria's manufacturing sector. Existing research primarily addresses theoretical aspects, leaving a gap in practical, data-driven insights (Durach et al., 2020). Nigeria presents unique challenges such as infrastructure deficits, regulatory hurdles, and market dynamics that may affect blockchain implementation differently compared to other regions. Current literature does not adequately address these context-specific factors (Queiroz & Wamba, 2020). Although blockchain is touted to improve supply chain efficiency, there is limited evidence demonstrating how it influences key performance indicators within Nigerian manufacturing firms. Understanding this impact is crucial for informed decision-making (Tönnissen & Teuteberg, 2020). Factors hindering the adoption of blockchain technology in Nigeria's manufacturing sector, such as high implementation costs, lack of technical expertise, and resistance to change, are not thoroughly explored in recent studies (Hastig & Sodhi, 2020). Addressing these gaps will provide valuable insights into the practical implications of blockchain technology in enhancing the performance and competitiveness of manufacturing firms in Nigeria. This study aims to fill this gap by investigating the effects of blockchain technology proxied with Blockchain Transparency (BTC), Blockchain Traceability (BTB), Blockchain Security (BS) and Blockchain Data Integrity (BDI) on business performance (BP) of selected manufacturing firms in Delta State, Nigeria.

Research Questions

- v. How does blockchain transparency affect the business performance of selected manufacturing firms in Delta State?
- vi. What is the effect of blockchain traceability on business performance of selected manufacturing firms in Delta State?

- ii. To what extent does blockchain security contribute to business performance of selected manufacturing firms in Delta State?
- iii. How does blockchain-enhanced data integrity influence business performance of selected manufacturing firms in Delta State?

Objectives of the Study

The main objective of this study is to examine the effect of blockchain technology on the business performance of selected manufacturing firms in Delta State, Nigeria. The specific objectives are:

- to evaluate the effect of blockchain transparency on business performance of selected manufacturing firms in Delta State.
- i. to determine the influence of blockchain traceability on business performance of selected manufacturing firms in Delta State.
- ii. to assess the effect of blockchain security on business performance of selected manufacturing firms in Delta State.
- iii. to investigate how blockchain-enhanced data integrity affects business performance of selected manufacturing firms in Delta State.

Research Hypotheses

H₀₁: Blockchain transparency has no significant effect on business performance of selected manufacturing firms in Delta State.

H₀₂: Blockchain traceability does not significantly affect business performance of selected manufacturing firms in Delta State.

H₀₃: Blockchain security has no significant influence on business performance of selected manufacturing firms in Delta State.

H₀₄: Blockchain-enhanced data integrity does not significantly affect business performance of selected manufacturing firms in Delta State.

Review of Related Literature

Blockchain Technology

Blockchain technology is a decentralized and distributed ledger system that allows secure and transparent recording of transactions across multiple nodes in a network. Introduced in 2008 as the foundation of Bitcoin (Nakamoto, 2008), it has evolved to become a tool with transformative potential in various sectors, including finance, healthcare, logistics, and manufacturing. The primary characteristic of blockchain is its ability to ensure data immutability, which means once data is recorded, it cannot be altered without consensus from the network (Zohar et al., 2021). This feature is particularly advantageous in sectors where transparency and security are paramount. Recent studies have underscored blockchain's capacity

to streamline processes and reduce operational costs. For example, according to a report by Tapscott and Tapscott (2020), blockchain's decentralized nature enhances trust between parties, making it a powerful tool in industries that involve complex supply chains and numerous stakeholders. Additionally, blockchain's integration with technologies like the Internet of Things (IoT) and Artificial Intelligence (AI) has further amplified its potential in optimizing manufacturing and logistics operations (Garg & Yadav, 2021).

Blockchain Transparency (BTC)

Blockchain transparency refers to the openness and accessibility of data stored within the blockchain system. It allows all authorized users to view and verify transaction records, promoting accountability and reducing opportunities for fraud. In the context of manufacturing, transparency is essential for enhancing operational visibility and fostering trust between business partners (Seitz et al., 2021). A study by Chen et al. (2021) demonstrated that blockchain transparency significantly reduced inefficiencies in the supply chain by enabling real-time monitoring of product movement and transaction status. Transparency through blockchain ensures that all parties involved in the manufacturing process—from suppliers to consumers—have access to the same verifiable data, minimizing the potential for conflicts or discrepancies. The application of blockchain transparency in manufacturing can lead to better decision-making, as stakeholders can make informed choices based on the immutable and transparent nature of the data.

Blockchain Traceability (BTB)

Traceability refers to the ability to track the history and movement of a product throughout its entire lifecycle, from raw material sourcing to final consumption. In manufacturing, traceability is critical for maintaining quality control, preventing counterfeit goods, and ensuring compliance with regulatory standards (Li et al., 2021). Blockchain enhances traceability by creating a tamper-proof record of every transaction or change in the supply chain, ensuring that product origins and movements are well-documented. According to Wang et al. (2022), the traceability feature of blockchain technology provides manufacturers with a clear and auditable history of a product's journey, significantly reducing the occurrence of counterfeit goods and enhancing the credibility of products. This feature also allows for quick identification and resolution of quality issues, making it easier to recall defective products, if necessary. In Nigeria, where issues like counterfeit products in manufacturing are rampant, blockchain traceability presents an effective solution for ensuring product authenticity and safety (Adeyemo et al., 2021).

Blockchain Security (BS)

Security is one of the fundamental attributes of blockchain technology. Blockchain uses advanced cryptographic techniques to ensure the integrity and confidentiality of data. Unlike traditional databases, where data can be altered or deleted by authorized parties, blockchain's immutability feature prevents unauthorized changes once data is recorded, making it highly secure (Crosby et al., 2020). In the manufacturing sector, security concerns related to data breaches, cyberattacks, and unauthorized access to sensitive information are prevalent (Shetty & Singh, 2021). Blockchain's security features are vital in mitigating these risks by ensuring that data is securely stored and accessible only by authorized users. This aspect of blockchain can also protect intellectual property, trade secrets, and sensitive customer information, which are valuable assets in manufacturing firms (Chang et al., 2021). A study by Alzahrani et al. (2020) revealed that the implementation of blockchain in supply chain management enhanced the security of transactions, particularly in industries dealing with sensitive or high-value products, such as pharmaceuticals and electronics. In Nigeria, where cybercrime poses a significant challenge to businesses, the adoption of blockchain security can bolster trust and protect critical business assets.

Blockchain Data Integrity (BDI)

Data integrity is the assurance that data remains accurate, consistent, and trustworthy over its lifecycle. Blockchain ensures data integrity through its immutable ledger, where once data is recorded, it cannot be tampered with without altering every subsequent block, which would require the consensus of the network (Böhme et al., 2020). This capability is particularly valuable in manufacturing, where accurate data is essential for maintaining quality, ensuring compliance, and making informed decisions. Research by Park and Kim (2021) highlighted that blockchain enhances data integrity by eliminating errors associated with manual data entry and mitigating risks related to data manipulation. In manufacturing environments, where data is constantly generated across various stages of production, blockchain technology ensures that information related to inventory, production schedules, and supply chain status remains reliable. This also aids in maintaining compliance with industry regulations, such as product safety standards.

Business Performance (BP)

Business performance in the manufacturing sector is a measure of a firm's operational efficiency, profitability, and ability to meet market demands. Blockchain technology can significantly impact business

performance by optimizing processes, enhancing transparency, and improving supply chain management. According to a study by Sharma et al. (2021), the adoption of blockchain led to reduced operational costs, improved product quality, and greater customer satisfaction. In the context of Nigeria's manufacturing sector, where inefficiencies and fraud often hinder business performance, blockchain presents a solution to optimize operations. Adeyemo et al. (2021) noted that blockchain integration improved decision-making by providing reliable and real-time data, which is crucial for manufacturing firms operating in dynamic and competitive markets. Furthermore, the increased transparency and traceability enabled by blockchain enhance relationships with suppliers and customers, improving trust and market competitiveness.

Blockchain Technology on Business Performance in Manufacturing in Nigeria

In Nigeria, the manufacturing industry faces numerous challenges; including supply chain inefficiencies, counterfeit goods, and security risks. The adoption of blockchain technology has the potential to address these issues and enhance business performance in the sector. A study by Okoli and Nwachukwu (2021) suggested that blockchain technology could enhance supply chain transparency, reduce operational costs, and improve product quality in Nigerian manufacturing firms. Blockchain's ability to provide real-time, verifiable data on product movements and transaction histories can foster trust among stakeholders and lead to more efficient operations (Afolabi & Nwachukwu, 2021). In addition, blockchain's ability to prevent fraud and ensure data integrity is particularly important in Nigeria, where counterfeiting and data breaches are major concerns (Alabi et al., 2021). As such, blockchain adoption can help Nigerian manufacturers improve operational efficiency, enhance product quality, and strengthen relationships with customers and suppliers, ultimately improving their business performance.

Theoretical Review

Distributed Ledger Theory (DLT)

Distributed Ledger Theory (DLT) is a foundational concept that describes a decentralized database that is maintained and shared across multiple nodes within a network. The origin of DLT can be traced back to the early developments of cryptographic systems, particularly the introduction of blockchain in the context of Bitcoin by Satoshi Nakamoto in 2008. Nakamoto's work demonstrated that a decentralized ledger could be used to ensure secure transactions without the need for intermediaries like banks (Nakamoto, 2008). This theory has evolved from a pure cryptocurrency application into a broader technology

used in various industries to ensure data integrity, transparency, and security.

DLT supports blockchain transparency (BTC) by enabling an immutable record of transactions that are visible and accessible to all participants in the network. Through this feature, blockchain ensures that manufacturing firms' operations are more transparent, providing real-time information to all stakeholders. For instance, in Delta State, Nigeria, the use of blockchain-based DLT can ensure that every transaction, such as raw material procurement or product distribution, is recorded in an open ledger. This reduces the opportunity for fraudulent activities and enhances trust among manufacturers, suppliers, and customers (Seitz et al., 2021). Furthermore, DLT supports traceability (BTB) by providing an auditable trail of all product transactions, allowing firms to track the origin of raw materials, product movement, and quality at every stage. This visibility contributes to greater operational efficiency and better business performance (Wang et al., 2022). In relation to business performance (BP), DLT's ability to create a secure, transparent, and immutable ledger allows manufacturing firms in Delta State to improve operational processes, reduce supply chain inefficiencies, and increase stakeholder confidence. By enhancing transparency and traceability, DLT facilitates smoother transactions and decision-making, which ultimately drives better business outcomes.

Game Theory (Incentive Mechanisms)

Game Theory, introduced by mathematician John von Neumann and economist Oskar Morgenstern in 1944, is a theoretical framework used to understand the strategic interactions between rational decision-makers. The application of Game Theory to blockchain technology is particularly relevant in the context of incentive mechanisms. These mechanisms ensure that participants in a blockchain network act in ways that maintain the integrity of the system. In blockchain, miners or validators are incentivized through mechanisms such as proof-of-work (PoW) or proof-of-stake (PoS) to validate and secure transactions, ensuring that the network remains decentralized and functional.

Incentive mechanisms play a critical role in Blockchain Security (BS). By applying Game Theory principles, blockchain systems incentivize honest behavior and disincentivize malicious activities such as fraud or double-spending. In manufacturing firms, this aspect of blockchain can help safeguard sensitive data and transactions, ensuring that security breaches are minimized and that the integrity of supply chain data is maintained (Alzahrani et al., 2020). Moreover, the incentive structure of blockchain encourages participants to follow the rules of the network, thus ensuring the security and privacy of sensitive business

data, which is critical for manufacturing firms dealing with proprietary information. Game Theory's influence extends to Blockchain Data Integrity (BDI), as the incentives embedded within blockchain protocols ensure that participants are motivated to maintain accurate and reliable data. When applied to the manufacturing sector in Delta State, Nigeria, this feature of blockchain allows for accurate record-keeping, ensuring that manufacturers make informed decisions based on trustworthy data. For instance, through the use of smart contracts, blockchain can automate various manufacturing processes, reducing human error and improving data integrity in the supply chain.

Thus, Game Theory and its incentive mechanisms help to improve business performance (BP) by reducing costs related to fraud, improving security, and ensuring that the data used for decision-making is accurate and reliable. By promoting secure and efficient systems for managing transactions and data, blockchain technology enhances the overall performance of manufacturing firms in Delta State, Nigeria.

Cryptographic Theory

Cryptographic Theory has been pivotal in the development of blockchain technology. Cryptography, as a field of study, deals with securing communication and information through the use of mathematical algorithms. The application of cryptographic techniques to blockchain technology ensures that data is encrypted and secured, preventing unauthorized access, tampering, or fraud. The concept of using cryptography to ensure the security and privacy of transactions was popularized by the introduction of Bitcoin (Nakamoto, 2008), which relied on cryptographic hash functions and public-private key pairs for secure transactions.

Cryptography underpins Blockchain Security (BS) by providing the foundation for secure transactions and safeguarding sensitive data in manufacturing operations. Through the use of hashing, digital signatures, and encryption, blockchain technology ensures that data cannot be altered or tampered with, thereby preserving the security and confidentiality of business operations. For example, in the context of manufacturing in Delta State, cryptographic techniques in blockchain can protect intellectual property, contracts, and sensitive operational data from unauthorized access or cyberattacks (Shetty & Singh, 2021).

Cryptographic theory also contributes to Blockchain Transparency (BTC) by ensuring that all transactions are verifiable and traceable. While the data is transparent to authorized users, cryptographic encryption ensures that the participants' identities and sensitive information remain protected. This balance

between transparency and privacy allows manufacturing firms to operate in an open yet secure environment, where stakeholders can access relevant data without compromising business confidentiality (Chang et al., 2021).

Furthermore, cryptographic techniques are critical to Blockchain Data Integrity (BDI), as they guarantee the authenticity and consistency of the data stored on the blockchain. Since each block is linked through cryptographic hashes, any alteration to the data would require the modification of all subsequent blocks, making tampering virtually impossible. For manufacturing firms in Delta State, Nigeria, this ensures that product quality and supply chain data remain accurate and reliable, which is essential for decision-making and regulatory compliance.

In relation to business performance (BP), the application of cryptography in blockchain technology enhances operational efficiency, reduces security risks, and fosters trust among stakeholders, all of which contribute to improved business outcomes. As manufacturing firms in Delta State face challenges such as data breaches and counterfeit products, cryptographic security offers a robust solution to mitigate these risks and improve overall performance.

Empirical Review

Wang, Zhao, and Jiang (2022) explored the potential of blockchain to improve transparency and traceability in supply chains, focusing on the manufacturing sector. The study employed a survey methodology, collecting data from 150 firms in China. The data were analyzed using structural equation modeling (SEM) to assess the effect of blockchain's transparency and traceability on supply chain performance. Findings revealed that blockchain's transparency significantly improved supply chain visibility, while traceability reduced the occurrence of counterfeit products. The study concluded that blockchain enhances business performance by increasing operational transparency and reducing risks associated with counterfeit goods. The authors recommended that firms integrate blockchain to optimize supply chain operations and improve performance.

Chang, Liu, and Yang (2021) examined the role of blockchain technology in enhancing operational performance, focusing on transparency, traceability, and data integrity in the manufacturing sector. The study adopted a mixed-methods approach, combining qualitative interviews with industry experts and quantitative surveys from 150 manufacturing firms in China. Data analysis was conducted using multiple regression to assess the relationship between blockchain technology and business performance. The results revealed that blockchain's security and data integrity features significantly improved manufacturing

performance by reducing fraud and ensuring accurate and reliable data. The study concluded that blockchain adoption can enhance the overall operational efficiency of firms, and recommended that manufacturers consider integrating blockchain into their business processes to improve security and traceability.

Li, Guo, and Liu (2021) focused on the impact of blockchain on supply chain efficiency and performance, specifically examining blockchain's transparency (BTC), traceability (BTB), and data integrity (BDI) in the automotive industry. The researchers used a quantitative survey methodology, collecting data from 120 firms in Europe. Structural equation modeling (SEM) was used to analyze the data. The study found that blockchain's transparency and traceability significantly enhanced supply chain performance by providing real-time access to product information and ensuring the authenticity of products. Data integrity also played a crucial role in improving operational efficiency and reducing costs. The authors concluded that blockchain is a powerful tool for improving business performance in the automotive sector and recommended its adoption across manufacturing supply chains.

Shetty and Singh (2021) examined the role of blockchain technology in enhancing the security and data integrity of manufacturing firms. The study employed a survey methodology, collecting data from 100 manufacturing firms in India. Regression analysis was used to analyze the relationship between blockchain features, such as security (BS) and data integrity (BDI), and business performance (BP). The results indicated that blockchain's security features significantly enhanced data protection, reducing the risks of data breaches and improving the trustworthiness of operations. The study concluded that blockchain technology improves business performance by strengthening data security and integrity. The authors recommended that manufacturing firms adopt blockchain to safeguard sensitive data and enhance operational efficiency.

Literature Gaps

The growing application of blockchain technology in the manufacturing sector has garnered significant attention due to its potential to enhance transparency, traceability, security, and data integrity. Numerous studies have examined the role of blockchain in improving business performance, particularly in supply chain operations. While empirical studies provide insights into blockchain's impact on manufacturing efficiency, several gaps remain in the existing literature that warrant further investigation. These gaps are particularly evident in findings, variables, methodology, and geographical focus, especially in the context of Nigeria, where blockchain adoption is still at an early

stage. This research aims to address these gaps by focusing on the effect of blockchain technology, proxied by blockchain transparency (BTC), traceability (BTB), security (BS), and data integrity (BDI), on the business performance (BP) of selected manufacturing firms in Nigeria.

Findings Gaps: Although several studies highlight the positive influence of blockchain's transparency, traceability, and security on supply chain performance and business outcomes (e.g., Alzahrani et al., 2020; Chang et al., 2021; Jain et al., 2021), there remains a lack of consensus on the specific mechanisms through which these blockchain attributes influence business performance. For instance, while Alzahrani et al. (2020) found that transparency and traceability improve operational efficiency, the specific aspects of business performance—such as profitability, customer satisfaction, and market share—were not fully explored in the context of the Nigerian manufacturing sector. Additionally, the role of data integrity in strengthening decision-making and business operations, as discussed by Feng et al. (2021) and Jain et al. (2021), has not been systematically examined in the Nigerian manufacturing context. These gaps highlight the need for more targeted studies that examine the causal relationships between blockchain attributes and various dimensions of business performance.

Variables Gaps: While many studies have focused on key blockchain attributes like transparency, traceability, security, and data integrity (e.g., Li et al., 2021; Wang et al., 2022), few studies have analyzed how these variables interact with each other and influence different aspects of business performance. For example, Li et al. (2021) concentrated on traceability and transparency but did not fully integrate the interaction between security and data integrity in their model, which are crucial to understanding blockchain's full impact on business operations. Similarly, Alzahrani et al. (2020) highlighted the impact of transparency and traceability on supply chain efficiency, but they did not explore how these variables, in conjunction with security, influence organizational performance outcomes such as profitability, growth, or sustainability. The integration of these blockchain features into a comprehensive model remains a critical gap in the literature.

Methodological Gaps: The studies reviewed primarily employed quantitative methods, such as structural equation modeling (SEM) and regression analysis, to assess the impact of blockchain technology on business performance (e.g., Chang et al., 2021; Jain et al., 2021; Alzahrani et al., 2020). While these approaches provide valuable insights, they often lack a deeper qualitative

understanding of how blockchain is implemented and the challenges firms face in adopting this technology. For example, Shetty and Singh (2021) used regression analysis to demonstrate the impact of security and data integrity on performance, but did not explore the managerial, organizational, or technological challenges encountered by manufacturing firms. Furthermore, the studies generally lacked longitudinal data that could provide insights into the long-term effects of blockchain adoption on performance metrics. More mixed-methods or longitudinal research is needed to explore the implementation challenges, processes, and sustained benefits of blockchain technology in manufacturing firms.

Geographical Gaps: Although the studies reviewed provide insights from various global contexts, there is a notable geographical gap, particularly in the African region. Many of the empirical studies are based on data from countries like China, India, and Saudi Arabia (e.g., Chang et al., 2021; Li et al., 2021; Jain et al., 2021), with limited attention paid to sub-Saharan Africa, specifically Nigeria. While Akinyele et al. (2021) examined blockchain in the Nigerian manufacturing context, their study was limited in scope and did not fully explore the regional challenges, such as infrastructure limitations, regulatory frameworks, and market conditions that influence blockchain adoption. The majority of studies, including those from Pakistan and India (Khan et al., 2021; Sundararajan et al., 2021), focus on well-established or emerging markets where blockchain adoption is relatively advanced. The Nigerian manufacturing sector, however, faces unique challenges, such as infrastructural gaps, which may significantly influence the effectiveness of blockchain technology in improving business performance. Therefore, there is a need for more focused studies that investigate how blockchain can be successfully integrated into Nigerian manufacturing firms to improve their performance.

Tools and Methods

Research Design

This study adopted a descriptive survey research design. The population of this study consisted of employees from five selected manufacturing firms in Delta State, Nigeria, who were involved in operations that could be impacted by blockchain technology. These employees included supply chain managers, IT personnel, and senior executives within Nigerian Breweries Plc, West African Plastics Ltd, Delta Steel Company Ltd, Dufil Prima Foods Plc, and Excel Paints Manufacturing Ltd. These individuals were considered ideal as they were in positions to provide insights on how blockchain attributes such as transparency, traceability, security, and data integrity influenced business performance

within their respective firms. The total population was estimated to be approximately 150 employees across the five firms, based on internal records. This number was adopted because of the size as permissible in research when the sample is small (xxxx). This study employed a stratified random sampling technique. The stratification was based on job roles within the selected manufacturing firms, including supply chain managers, IT personnel, and senior executives. Primary data were collected using a structured questionnaire. The questionnaire was distributed to respondents in the selected manufacturing firms. It was designed with a Likert-scale format, with respondents asked to rate their agreement with statements related to blockchain transparency, traceability, security, data integrity, and business performance. The Likert scale ranged from "Strongly Disagree" (1) to "Strongly Agree" (5). This method enabled the systematic collection of data that was easy to analyze quantitatively. The research instrument for this study was a structured questionnaire, which was divided into sections. The first section collected demographic information about the respondents, such as their job role and years of experience. The second section focused on the independent variables (blockchain transparency, traceability, security, and data integrity), while the third section addressed business performance, the dependent variable. Each section contained questions designed to capture respondents' perceptions and experiences with blockchain technology in their respective firms. The reliability of the research instrument was tested using Cronbach's alpha coefficient. A pilot study was conducted with a small group of respondents from similar manufacturing firms not included in the main study. The Cronbach's alpha values for each of the variables were calculated as follows:

Blockchain Transparency (BTC): $\alpha=0.82$

Blockchain Traceability (BTB): $\alpha=0.79$

Blockchain Security (BS): $\alpha=0.85$

Blockchain Data Integrity (BDI): $\alpha=0.88$

Business Performance (BP): $\alpha=0.81$

These values indicated that the instrument had acceptable internal consistency, with all variables having a Cronbach's alpha value of 0.7 or above. Based on the results of the pilot study, minor revisions were made to the instrument to further enhance its reliability. The data collected from the questionnaires were analyzed using quantitative techniques. Descriptive statistics, such as frequencies, means, and standard deviations, were used to summarize and describe the characteristics of the data. Multiple regression analysis was employed to examine the relationships between the independent variables (blockchain transparency, traceability, security, and data integrity) and the dependent variable (business performance). This statistical technique was appropriate because it allowed

for the assessment of the simultaneous effects of multiple independent variables on a single dependent variable. The regression analysis helped determine the extent to which each of the blockchain attributes affected business performance and identified which variable had the most significant impact. The study was guided by a model ($BP = \beta_0 + \beta_1 BTC + \beta_2 BTB + \beta_3 BS + \beta_4 BDI + \epsilon$) reflecting BP = Business Performance (dependent variable), BTC = Blockchain Transparency (Independent variable), BTB = Blockchain Traceability (Independent variable), BS = Blockchain Security (Independent variable), BDI = Blockchain Data Integrity (Independent variable), β_0 = Intercept, β_1 –

Descriptive Statistics

Descriptive analysis using SPSS showed that most firms had integrated blockchain applications mainly in

Variable	N	Mean	Std. Deviation	Interpretation
Blockchain Transparency	140	4.21	0.63	High
Blockchain Traceability	140	4.08	0.71	High
Blockchain Security	140	4.35	0.58	Very High
Data Integrity	140	4.27	0.65	High
Business Performance	140	4.18	0.69	High

The descriptive results suggest that respondents strongly agreed that blockchain technology enhances transparency, traceability, data integrity, and overall operational security, which in turn improves performance indicators such as productivity, quality control, and customer trust.

Regression Analysis

A multiple regression analysis was conducted to examine the effect of the four blockchain constructs (transparency, traceability, security, and data integrity) on business performance.

β_4 = Coefficients for each independent variables and ϵ = Error term

Analysis, Results and Discussion

Data Presentation and Response Rate

Out of the 150 questionnaires administered to selected manufacturing firms in Delta State, 140 were properly completed and returned, representing a 93.3% response rate. This high response rate was considered adequate for robust statistical analysis. The respondents comprised top and middle management staff from production, finance, ICT, and operations departments, ensuring diverse insights on blockchain adoption and business performance.

supply chain management, quality assurance, and data recording.

Model Summary:

$R = 0.872$

$R^2 = 0.761$

Adjusted $R^2 = 0.749$

$F(4,135) = 107.23, p < 0.001$

This indicates that 76.1% of the variation in business performance is explained by the combined influence of blockchain transparency, traceability, security, and data integrity.

Coefficients Table:

Predictor Variable	Beta (β)	t-value	Sig. (p)	Interpretation
Blockchain Transparency	0.254	4.672	0.000	Significant
Blockchain Traceability	0.198	3.861	0.001	Significant
Blockchain Security	0.301	5.497	0.000	Significant
Data Integrity	0.276	4.208	0.000	Significant

Interpretation of Findings

The regression results reveal that blockchain security ($\beta = 0.301$) exerts the strongest positive effect on business performance, followed by data integrity ($\beta = 0.276$) and transparency ($\beta = 0.254$). Traceability also contributes significantly ($\beta = 0.198$), though slightly lower than the others. This implies that blockchain adoption enhances secure transactions, reduces data

tampering, improves traceability, and promotes trust-based performance in manufacturing operations.

Qualitative Insights

Interviews with 10 managers revealed that blockchain technology has improved accountability, streamlined record-keeping, and reduced losses from counterfeit products. One production manager noted that “blockchain-based traceability has significantly

improved customer confidence and reduced product recalls.” Another ICT officer emphasized that “enhanced data integrity has minimized audit discrepancies and increased operational transparency across departments.”

The qualitative data corroborate the quantitative findings by highlighting that blockchain systems foster reliability, transparency, and inter-departmental efficiency, thereby reinforcing competitive advantage and business sustainability.

Discussion of Findings

The findings align with earlier empirical studies (e.g., Kamble et al., 2021; Saberi et al., 2019) which established that blockchain transparency and traceability enhance supply chain visibility and operational efficiency. Similarly, the strong positive impact of blockchain security on business performance supports Tijan et al. (2020), who emphasized that blockchain’s immutable nature reduces fraud and ensures data protection.

In the Delta State context, these results suggest that manufacturing firms leveraging blockchain experience improved performance outcomes—particularly in customer trust, process efficiency, and compliance management. However, challenges such as limited technical expertise, infrastructural constraints, and regulatory ambiguity still pose barriers to widespread blockchain adoption.

Summary

The study revealed that blockchain transparency plays a vital role in improving trust and accountability, which in turn enhances the overall business performance of manufacturing firms. Blockchain traceability was found to strengthen supply chain visibility, thereby reducing operational inefficiencies and improving productivity. Among the blockchain dimensions examined, security had the most significant impact, as it safeguards critical business data and ensures operational reliability. Additionally, data integrity was shown to enhance decision-making accuracy and promote organizational efficiency. Overall, both the quantitative and qualitative analyses confirmed that blockchain adoption exerts a positive and significant effect on the business performance of manufacturing firms in Delta State, highlighting its strategic importance for competitiveness and sustainability.

5. Conclusion

This study examined the effect of blockchain technology on the business performance of selected manufacturing firms in Delta State, Nigeria, using both

quantitative and qualitative approaches. The analysis of 140 valid responses revealed that blockchain transparency, traceability, security, and data integrity each exert significant positive influences on business performance.

Specifically, blockchain security emerged as the most influential factor, underscoring the technology’s role in protecting business data, ensuring safe transactions, and fostering trust among partners and customers. Data integrity and transparency were also found to be strong drivers of performance, enabling accurate decision-making and enhancing accountability. Similarly, traceability improved supply chain monitoring, quality control, and customer satisfaction.

The findings affirm that blockchain adoption contributes meaningfully to operational efficiency, product authenticity, and corporate credibility in Nigeria’s manufacturing sector. However, the study also highlights persistent challenges such as limited technical expertise, infrastructural constraints, and regulatory uncertainty, which may hinder full-scale blockchain implementation.

In conclusion, blockchain technology stands as a strategic digital innovation capable of transforming the operational landscape of manufacturing firms in Delta State. When effectively integrated, it enhances performance, competitiveness, and long-term sustainability.

Recommendations

Based on the findings, the following recommendations are proposed:

The study recommends that manufacturing firms in Delta State should first invest in robust blockchain infrastructure by adopting digital platforms and tools that enhance data management, traceability, and security across operations.

- i. There is a need for capacity building and continuous training to equip employees with the technical knowledge and skills required for effective blockchain implementation and cybersecurity management.
- ii. That regulatory support and institutional collaboration should be strengthened through clear government policies, industry standards, and partnerships between public and private sectors to promote innovation and ensure compliance with data protection laws.
- iii. Lastly, firms should integrate blockchain into supply chain and operational systems while continuously evaluating its performance impact, promoting data integrity, and leveraging complementary technologies such as Artificial Intelligence (AI) and the Internet of Things (IoT) to drive sustained business growth and competitiveness.

Publication Date: 2025/11/28

Abstract

Employee commitment has become a crucial factor in organization success and sustainability. This study explored the relationship between job social characteristics and employee commitment within selected firms in the alcoholic beverage sector in Edo State. This study adopted the descriptive cross-sectional design with the approach of a survey. 289 employees sampled using Taro Yamane's formula was used for this study. The research instrument was a questionnaire with close ended questions, which was subjected to face and content validation, and then Cronbach Alpha reliability. Descriptive statistics was used to analyze data, and Pearson Correlation analysis was used to test the hypothesis for the study. Findings showed that there was significant and positive influence between social support, initiated interdependence, interaction outside the organization, feedback from others and employee commitment. The study concluded that cultivating a socially supportive work atmosphere is necessary in order to enhance commitment, reduce turnover, and improve overall organizational performance. It was recommended that these firms create a collaborative and supportive work environment, design work processes that enhance the interdependence of tasks, encourage and facilitate employees' engagement with external stakeholders and implement regular and structured feedback mechanisms.

Keywords: Job social characteristics, employee commitment, social supported, initiated interdependence, interaction and feedback

Introduction

Employee commitment is widely recognized as a critical factor for organizational success and long-term performance (Alniacik et al., 2020; Elnaga & Imran, 2021). It reflects an individual's psychological attachment to the organization, encompassing feelings of belonging, alignment with business goals, and readiness to overcome challenges (Bedarkan & Pandita, 2021). Commitment manifests in employees' passion, engagement, and deliberate effort in performing their work (Schelling, 2021; Sigler & Pearson, 2020). Job social characteristics—such as skill variety, task identity, task significance, autonomy, and feedback—play a crucial role in fostering commitment (Ling et al., 2021). When employees perceive their jobs as meaningful and believe the organization values their well-being, they are more motivated, show higher self-esteem, critical thinking, and job satisfaction, and engage more fully in their tasks (Raut et al., 2021; Hohd et al., 2020). Positive job characteristics also enhance employee behavior, motivation, and interactions within the work environment. Employees satisfied with these characteristics are more likely to demonstrate cooperation, teamwork, punctuality, and

productivity, contributing to a supportive and motivating work environment. Overall, employee commitment, strengthened by meaningful work and supportive job characteristics, is essential for achieving high performance, organizational effectiveness, and sustained competitive advantage.

Problem Statement

Employee commitment has become a crucial factor in organization success and sustainability. Employee commitment is the psychological attachment and loyalty an employee feels towards their organization. Despite its importance, organization frequently struggle to understand and manage the underlying factor that influence this commitment. Some problems are: The lack of comprehensive insight into this relationship poses several challenges for organizations without a clear understanding of which social characteristics are most influential; organizations may implement generic or misaligned initiatives that fails to address the specific needs and concern of their employee. This can result in sub optimal level of commitment, leading to increased turnover rates, decreased job satisfaction and diminished organizational performance. Lack of

employee commitment in many organizations result in poor performance, low morale, inefficiency and dissatisfaction, but it can be addressed by identifying and implementing strategies to improve employee's engagement and commitment.

Objective of the study

The primary objective of this research is to explore the relationship between job social characteristics and employee commitment in firms in Edo State. The specific objectives include:

- i. to examine the influence of social support on employee commitment in firms
- ii. to determine the effect of initiated interdependence on employee commitment in firms
- iii. to access the extent of interaction outside the organization on employee commitment in firms d.
- iv. to determine the impact of feedback from others on employee commitment in firms

Research Questions

- i. What is the influence of social support on employee commitment in firms?
- ii. What is the effect of initiated interdependence on employee commitment in firms?
- iii. To what extent does interaction from outside the organization impact employee commitment in firms?
- iv. What is the impact of feedback from others on employee commitment in firms?

Statement of Hypotheses

H₀₁: There is no significant influence of social support on employee commitment in firms.

H₀₂: There is no significance effect of initiated interdependence on employee in firms.

H₀₃: There is no significance extent of interaction outside the organization on employee commitment in firm.

H₀₄: There is no significance impact of feedback from others on employee commitment in firms.

Literature Underpinnings

The Concept of Social Support in the Workplace

Social support in the workplace refers to the psychological and material assistance employees receive from colleagues, supervisors, or others within the organization. It plays a crucial role in enhancing job satisfaction, reducing stress, and strengthening employee commitment (Pressman et al., 2020). This support can take various forms—emotional (empathy and understanding), instrumental (practical help), informational (guidance and advice), and **appraisal** (constructive feedback) (Jolly et al., 2021). Social support is typically classified by its source: supervisor support, which promotes organizational commitment,

and coworker support, which fosters positive interpersonal relationships and job satisfaction. Together, these support systems create a network that helps employees cope with work stress and improve performance, making social support a vital aspect of organizational behavior and employee well-being.

The Role of Social Support in Employee Well-being and Commitment

Social support significantly enhances employee well-being and strengthens organizational commitment. Employees who perceive strong social support experience less stress and burnout, as such support provides resources to cope with workplace challenges like workload, conflict, and role ambiguity (Foy et al., 2019). It acts as a buffer against negative job stressors, reducing dissatisfaction and improving mental health. Through the lens of social exchange theory, supportive interactions between employees, supervisors, and coworkers build trust, respect, and loyalty (Kim & Qu, 2020). When employees feel valued and appreciated, they develop stronger emotional attachment, motivation, and dedication to the organization (Chernyak-Hai & Rabenu, 2017). Thus, social support not only promotes well-being but also deepens employees' commitment and sense of belonging.

Social Support as a Buffer for Workplace Stress

Social support acts as a protective buffer against workplace stress by helping employees manage pressure and cope with challenges (Cohen & McKay, 2020). According to the buffering hypothesis, employees who perceive strong support from colleagues or supervisors experience less stress because they can access emotional reassurance, advice, or practical assistance. This support reduces feelings of isolation and helps employees remain resilient and focused under pressure (Schilbach et al., 2023). Empirical studies show that social support is positively linked to job satisfaction, commitment, and engagement (Fisenberger et al., 2020). Supported employees report greater fulfillment, stronger identification with organizational goals, and improved psychological well-being. Additionally, social support enhances job performance, creativity, and productivity (Ahmed et al., 2019) by reducing stress and fostering collaboration, trust, and innovation. Hence, organizations that promote supportive relationships create healthier, more motivated, and higher-performing workforces.

The Concept of Initiated Interdependence in the Workplace

Initiated interdependence refers to employees' proactive efforts to build and maintain collaborative relationships that support task completion and

organizational goals. Unlike structural or task-based interdependence—which is dictated by job design—initiated interdependence involves deliberate actions by employees to seek cooperation, share knowledge, and foster teamwork (Wu et al., 2018). In modern, complex workplaces that demand communication and collaboration, initiated interdependence enables employees to navigate challenges by forming networks of mutual support and problem-solving. It reflects a shift from passive reliance on others to active engagement, where employees voluntarily collaborate, exchange feedback, and contribute to team cohesion. This proactive behavior strengthens teamwork, creativity, and overall organizational performance by emphasizing shared responsibility and collective success.

Forms and Dimensions of Initiated Interdependence

Initiated interdependence manifests in several forms—information sharing, resource sharing, and joint decision-making—each reflecting proactive collaboration among employees. **Information sharing** involves voluntarily exchanging knowledge and expertise to enhance task performance, especially in knowledge-driven settings. Resource sharing refers to the active pooling of tangible or intangible resources, such as time, tools, or skills, to improve efficiency and collective outcomes (Dyer, 1997). Joint decision-making occurs when employees engage others in collaborative discussions to reach well-informed, innovative solutions. The dimensions of initiated interdependence vary by the intensity of collaboration, ranging from occasional exchanges to continuous cooperation and reliance on others. Higher levels of interdependence typically emerge in complex or uncertain work environments that demand frequent interaction and teamwork (Raveendran et al., 2020).

The Role of Initiated Interdependence in Employee Commitment

Initiated interdependence fosters employee commitment by strengthening social and task-based connections within the workplace. Employees who actively engage in collaborative behaviors build stronger relationships and experience greater emotional attachment to their organization, viewing their work as meaningful and team-oriented (Haque et al., 2019). By participating in decision-making and shared responsibilities, employees develop a heightened sense of **psychological ownership** and accountability, which increases motivation and dedication to organizational goals. Moreover, initiated interdependence promotes a **reciprocal exchange** of support and resources, reinforcing trust, cooperation, and mutual respect. This cycle of collaboration and shared success cultivates a

positive organizational culture that enhances employee engagement, loyalty, and long-term commitment.

Challenges and Barriers to Initiated Interdependence

Although initiated interdependence offers many benefits, its development is often hindered by organizational and social barriers. **Organizational silos** are a major obstacle, as isolated departments discourage collaboration and limit communication, leading to inefficiencies and lost innovation opportunities (Rope, 2021). Additionally, **power dynamics** within organizations can deter employees from initiating interdependent behaviors, especially when collaboration is perceived as a threat to authority or control. To address these barriers, organizations must **foster a culture that values collaboration**, promotes open communication, and ensures psychological safety—allowing employees to engage in interdependent relationships without fear of negative consequences (Roper, 2021).

The Concept of Interacting Outside the Organization

Interacting outside the organization refers to employees' deliberate engagement with external individuals, groups, or institutions—such as clients, suppliers, industry peers, or regulators—to exchange knowledge, build relationships, and promote innovation (Yu et al., 2019). In today's globalized and interconnected environment, this external engagement enhances adaptability, competitiveness, and organizational growth. Such interactions may occur **through** networking events, cross-company collaborations, industry forums, or community initiatives, allowing employees to gain new skills, perspectives, and resources. These activities not only foster personal and professional **development** but also strengthen the organization's **strategic capacity** by bringing in fresh ideas, insights into market trends, and exposure to industry best practices (Hassani & Mosconi, 2022). Overall, engaging beyond organizational boundaries enriches both individual performance and organizational innovation.

Forms of External Interactions

External interactions take three main forms—professional networking, industry collaboration, and community engagement—each contributing uniquely to employee and organizational development. Professional networking involves employees participating in conferences, workshops, and professional associations to exchange ideas, gain knowledge, and build relationships that enhance career growth and organizational competitiveness, especially in knowledge-driven industries (Ritzhaupt et al., 2020).

Industry collaboration entails formal partnerships with external stakeholders such as suppliers, customers, regulators, or competitors. These collaborations foster innovation, research, and value co-creation while exposing employees to new technologies and business models that expand their skills and problem-solving capacity (Herczeg et al., 2018). **Community engagement** includes employee involvement in outreach or social responsibility initiatives, strengthening the organization's CSR image and social reputation. It also gives employees a sense of purpose, personal fulfillment, and greater loyalty to the organization (Culum, 2018).

Challenges and Barriers to External Interactions

While interacting outside the organization offers numerous benefits, it also presents certain challenges and barriers. Employees and organizations must navigate these challenges to maximize the value of external interactions. One of the most common challenges is the management of external relationships. Employees may find it difficult to balance their internal responsibilities with the time and effort required to maintain external relationships. Moreover, organizations may be concerned about the potential risks of sharing proprietary information with external parties or losing control over collaborative projects. To address these challenges, organizations must establish clear guidelines for external interactions and ensure that employees are trained to manage these relationships effectively (Heath, 2020). Another barrier is the fear of external influence. Some organizations may resist external interactions due to concerns that external stakeholders could influence the organization's internal processes or culture in undesirable ways. This is especially true in highly regulated industries or organizations with rigid hierarchical structures. However, organizations that are overly insular may miss out on valuable opportunities for learning and innovation. To mitigate this risk, organizations can adopt a more open mindset and create a culture that values external input while maintaining control over core operations (Shaikh and Ranehawa, 2022).

The Concept of Feedback from Others

Feedback from others is an essential mechanism for personal and professional development, serving as a valuable tool in improving performance, behavior, and decision-making processes. In both organizational and individual contexts, feedback provides critical insights into areas of strength and weakness, allowing individuals to make informed adjustments to their actions and strategies. It encompasses the process of receiving information from colleagues, managers, peers, or external parties about one's performance or actions,

typically with the intent of fostering growth and improvement. The ability to give and receive feedback effectively is a vital competency in modern workplaces, where continuous learning and adaptation are key to success. In organizations, feedback loops help drive innovation, improve team dynamics, and enhance overall productivity: For individuals, feedback serves as a mirror, reflecting their achievements and areas for development. The concept of feedback from others extends beyond formal performance reviews or evaluations; it includes informal feedback, peer observations, and customer reviews, among other forms of external input. As a result, effective feedback contributes to both personal and organizational excellence.

Challenges and Barriers to Effective Feedback

Despite the numerous benefits of feedback from others, there are several challenges and barriers that can impede its effectiveness. These challenges can arise from both the giver and the receiver of feedback, and they often stem from issues related to communication, perception, and emotional responses.

Fear of Negative Feedback: One of the most common barriers to effective feedback is the fear of negative feedback. Both managers and peers may be hesitant to provide critical feedback out of concern that it will damage relationships or cause emotional distress. Similarly, individuals receiving feedback may react defensively or dismissively to negative feedback, especially if it is perceived as unfair or overly harsh (Cionea et al., 2023). This fear of negative feedback can prevent open communication and limit opportunities for growth. To overcome this barrier, organizations must foster a culture where feedback is viewed as a constructive and essential part of development, rather than a punitive measure.

Poor Communication Skills: Effective feedback requires strong communication skills, both from the giver and the receiver. Feedback that is vague, ambiguous, or overly critical can be misinterpreted or lead to misunderstandings. For feedback to be effective, it must be specific, focused on behavior rather than personality, and delivered in a manner that encourages dialogue and reflection (Jug et al., 2019). Additionally, individuals receiving feedback must have the emotional intelligence and active listening skills to process the information without becoming defensive or disengaged.

i. **Cultural Differences:** In global or diverse organizations, cultural differences can pose a challenge to effective feedback. Different cultures have varying norms and expectations when it comes to giving and receiving feedback. For example, in some cultures, direct and candid feedback is valued, while in others, indirect or face-saving approaches are preferred. Misunderstandings or discomfort may arise when

individuals from different cultural backgrounds interact in feedback situations (Aririguzoh, 2022). Organizations must be mindful of these cultural differences and provide training to ensure that feedback is delivered in a culturally sensitive manner.

- iv. **Feedback Fatigue:** Another challenge is feedback fatigue, which occurs when individuals feel overwhelmed by the amount of feedback they receive, particularly in organizations that emphasize continuous feedback. When employees are inundated with feedback, it can become difficult to prioritize which areas to focus on, leading to disengagement or burnout. To prevent feedback fatigue, organizations should ensure that feedback is purposeful, meaningful, and spaced out appropriately (Gordon, 2020).

The Concept of Employee Commitment

Employee commitment is a crucial factor in the success and sustainability of any organization. It reflects the level of engagement, loyalty, and attachment that employees feel towards their employer, the organization's goals, and their work environment. The concept is multidimensional and goes beyond the simple act of showing up to work or fulfilling job requirements. It encompasses an emotional, cognitive, and behavioral alignment between the employee and the organization. Employee commitment is essential for organizational growth and development, as committed employees are more likely to stay with the company, perform their duties diligently, and contribute to a positive work culture (Jehanzeb and Mohanty, 2018).

Dimensions of Employee Commitment

The concept of employee commitment can be broken down into several dimensions, most notably affective commitment, continuance commitment, and normative commitment. Each of these dimensions captures a unique aspect of the relationship between employees and their organization.

- i. **Affective Commitment:** This dimension refers to the emotional attachment that an employee feels towards their organization. Employees with high affective commitment identify with the organization's values, goals, and culture, and they genuinely enjoy being a part of the company. Their commitment stems from positive feelings and experiences within the organization, making them more likely to put in discretionary effort and stay with the company long-term. Affective commitment is typically seen as the most desirable form of commitment because it is voluntary and leads to high levels of engagement.
- ii. **Continuance Commitment:** This type of commitment is based on the perceived costs of leaving the organization. Employees who exhibit continuance commitment stay with the company because they

believe that leaving would result in financial loss, loss of job security, or difficulty finding similar employment elsewhere. In this case, the employee's commitment is driven by necessity rather than a strong emotional connection. While continuance commitment may result in long-term tenure, it does not necessarily indicate high engagement or job satisfaction.

- i. **Normative Commitment:** Normative commitment refers to the sense of obligation an employee feels to remain with the organization. Employees with strong normative commitment believe they ought to stay with the company due to moral or ethical reasons, such as loyalty to the organization, feelings of indebtedness, or societal norms. This type of commitment can be fostered by factors such as a supportive company culture or mentorship programs that create a sense of belonging. However, similar to continuance commitment, normative commitment may not always translate into high performance or enthusiasm for the job.

Theoretical Literature Review for Hypotheses

Social support in the workplace refers to the emotional, informational, and instrumental assistance that employees receive from their peers, supervisors, and the organization as a whole. The concept of social support is grounded in the idea that humans are social beings, and their well-being, both mental and emotional, is strongly influenced by the quality of interpersonal relationships. In organizational contexts, social support can take various forms, including coworker collaboration, managerial guidance, and organizational initiatives designed to promote employee welfare. Social support theory posits that employees who perceive higher levels of support from their work environment are likely to demonstrate stronger commitment to their employer, as it enhances their sense of belonging, reduces stress, and boosts morale (Kurtessis *et al* 2017).

Studies have found that social support positively correlates with various employee outcomes, including job satisfaction, productivity, and reduced turnover intentions (Le *et al*, 2023). A supportive work environment fosters a sense of loyalty and engagement, which are key components of employee commitment. Moreover, social support mitigates workplace stressors by providing employees with the resources they need to cope with job demands, thereby preventing burnout and disengagement (Gabriel and Aguinis, 2022). Conversely, the absence of social support can lead to feelings of isolation and dissatisfaction, which are detrimental to organizational commitment.

Despite the established link between social support and employee commitment, the possibility exists that there is no significant influence of social support on employee commitment in firms. This viewpoint could

stem from the argument that external factors such as compensation, career development opportunities, and personal motivations play a more significant role in determining employee commitment than social interactions alone. Proponents of this perspective argue that while social support may contribute to a positive work environment, its influence on employee commitment is not substantial enough to warrant strong conclusions (Jolly *et al* 2021).

Hypothesis 1: There is No Significant Influence of Social Support on Employee Commitment in Firms

Initiated interdependence refers to the extent to which employees rely on each other to complete tasks and achieve organizational goals. In work environments characterized by high interdependence, employees' tasks and responsibilities are closely linked, and success is contingent on collaboration and teamwork. This concept is rooted in theories of organizational behavior that emphasize the importance of coordination and collective effort in achieving optimal performance. Interdependence creates a shared sense of purpose and accountability, which can foster greater employee commitment to the organization.

Research in this area suggests that interdependence positively affects employee commitment by promoting a sense of shared responsibility and enhancing the social bonds between coworkers (Chatzopoulou *et al*, 2022). When employees are highly interdependent, they are more likely to value their role within the organization, as their contributions directly impact their colleagues and the firm's overall success. This interconnectedness creates a sense of belonging and strengthens employee's identification with the organization, both of which are critical components of commitment.

It may be argued that individualistic work environments, where employees have more autonomy and less reliance on others, can still foster high levels of commitment. This perspective highlights the possibility that other factors, such as personal work ethic, job satisfaction, and career aspirations, may overshadow the impact of interdependence on commitment (Krajcsák, 2020). Nevertheless, empirical studies generally support the view that interdependence enhances employee commitment, particularly in organizations that emphasize teamwork and collaborative efforts (Zhang *et al*, 2022). More research is needed to determine whether this effect varies across different industries and job types.

Hypothesis 2: There is No Significant Effect of Initiated Interdependence on Employee Commitment in Firms

Interactions outside the organization refer to the relationships and networks that employees establish

beyond the boundaries of their workplace. These interactions may include professional networking, involvement in industry associations, and informal relationships with individuals in other organizations. External interactions can provide employees with new perspectives, knowledge, and opportunities for growth, which may, in turn, influence their commitment to their current employer. Social exchange theory suggests that when employees engage in beneficial external interactions, they may feel more valued and connected, leading to greater organizational commitment (Nazis *et al*, 2018).

External networking can also enhance employees' sense of professional identity and competence. By participating in industry events or engaging with peers from other firms, employees may gain insights that improve their performance, contributing to job satisfaction and, ultimately, commitment to their employer. However, external interactions can also expose employees to new job opportunities, which might increase their turnover intentions if they perceive their current organization as less fulfilling or rewarding than potential alternatives (Aliyu and Nyadzayo, 2018). It can be argued that external interactions are often detached from the internal workings of the organization and therefore have a limited effect on an employee's commitment (Chatzopoulou *et al*, 2022). It can be inferred that internal factors, such as work relationships, compensation, and organizational culture, are more influential in shaping commitment. However, evidence from studies on social capital and networking suggests that employees who engage in external interactions can develop stronger professional identities, which can enhance their commitment to their current organization if they perceive it as a valuable platform for career development (Caza *et al*, 2018).

Hypothesis 3: There is No Significant Influence of the Extent of Interaction Outside the Organization on Employee Commitment in Firms

Feedback is a critical component of performance management and employee development. It refers to the information employees receive from their supervisors, peers, or customers about their performance, behaviors, and contributions within the organization. Feedback plays an essential role in helping employees understand how well they are meeting expectations and where improvements can be made. It is widely recognized that constructive feedback can enhance employee motivation, job satisfaction, and commitment by providing clear guidance and fostering a sense of personal growth (Dalkrani and Dimitriadis, 2018).

The relationship between feedback and employee commitment is supported by theories of motivation and organizational behavior. According to goal-setting

theory, specific and timely feedback helps employees set realistic goals and enhances their commitment to achieving those goals (Gogoi and Baruah, 2021). Furthermore, feedback can strengthen employees' emotional attachment to the organization by demonstrating that their efforts are recognized and valued. When employees receive positive feedback, they are more likely to feel satisfied with their work and committed to their employer. Conversely, the absence of feedback or the provision of negative feedback without constructive elements can lead to disengagement and reduced commitment (Rastogi *et al.*, 2018).

It can be argued that feedback is merely a tool for improving performance and does not necessarily influence an employee's long-term attachment to the organization (Burnett and Lisk, 2021). According to this perspective, other factors, such as job satisfaction, career opportunities, and compensation, are more critical determinants of employee commitment. However, research consistently shows that feedback plays a vital role in shaping employee engagement and commitment, particularly when it is delivered in a constructive and supportive manner (Panda *et al.*, 2022). Therefore, while feedback alone may not guarantee commitment, it is an essential component of a broader strategy for enhancing employee loyalty and retention.

Hypothesis 4: There is No Significant Impact of Feedback from Others on Employee Commitment in Firms

Theoretical Framework

The theoretical framework for this study integrates two primary theories that help explain the relationship between social support, initiated interdependence, interaction outside the organization, feedback from others, and employee commitment. These theories are Social Exchange Theory (SET) and Organizational Support Theory (OST). These frameworks provide insight into how interpersonal relationships, workplace dynamics, and feedback mechanisms influence employee behavior, commitment, and retention in organizations.

Social Exchange Theory (SET)

Social Exchange Theory (SET), proposed by Blau (1964), explains workplace relationships as a series of reciprocal exchanges where individuals evaluate the costs and benefits of their interactions. In organizations, SET suggests that employees show **greater commitment** when they perceive valuable returns—such as **support, recognition, and career growth**—for their contributions (Cropanzano & Mitchell, 2015). The theory emphasizes **reciprocity**, meaning

employees who receive **emotional, informational, or instrumental support** from their organization feel an obligation to reciprocate through loyalty and commitment (Colquitt *et al.*, 2014). This aligns with the first hypothesis on **social support**, where perceived fairness and balance in exchanges foster stronger commitment. Regarding **initiated interdependence**, SET explains that when employees depend on one another for achieving goals, a mutual sense of **responsibility and accountability** develops. This interdependence strengthens social bonds and encourages commitment to both team and organization (Zhang *et al.*, 2022). In relation to **feedback**, SET views constructive feedback as a valuable resource within the exchange process. When employees receive meaningful recognition and guidance, they perceive it as a **reward**, reinforcing their sense of belonging and organizational commitment. In contrast, inadequate or negative feedback can disrupt this exchange balance, leading to disengagement (Afrahi *et al.*, 2022). Overall, SET provides a comprehensive framework showing that **employee commitment grows when organizations maintain fair, reciprocal exchanges**—offering support, collaboration, and recognition in return for employees' contributions.

Organizational Support Theory (OST)

Organizational Support Theory (OST), introduced by Eisenberger *et al.* (1986), explains how employees' perceptions of being valued and cared for by their organization—known as **Perceived Organizational Support (POS)**—influence their attitudes and behaviors at work. High POS leads to stronger **job satisfaction, performance, and commitment**, as employees feel emotionally attached to and appreciated by their organization (Albalawi *et al.*, 2019). OST provides a strong foundation for understanding the **influence of social support on employee commitment**. Employees who perceive genuine concern and assistance from their organization and colleagues develop **affective commitment**, remaining loyal out of emotional attachment rather than obligation (Nazir *et al.*, 2018). The theory also extends to **external interactions**. When organizations support employees' participation in professional networks, conferences, or industry collaborations, employees interpret this as investment in their long-term growth—thus enhancing their perception of organizational support and, consequently, their commitment (Nazir *et al.*, 2018). Similarly, **initiated interdependence**—where employees rely on each other to achieve goals—strengthens POS when organizations encourage teamwork and provide resources for collaboration. This shared environment fosters a sense of belonging and collective success, reinforcing commitment. Finally, **feedback from others** serves as a direct expression of

organizational support. Positive or constructive feedback communicates recognition and care, signaling that the organization values employee contributions and development. Such feedback enhances POS and, by extension, organizational commitment (Naz et al., 2020). In essence, OST underscores that when employees **feel supported—socially, professionally, and developmentally—they reciprocate with higher loyalty, engagement, and commitment** to the organization.

Empirical Review

Social Support and Employee Commitment

Research across different contexts consistently shows that **social support**—especially from supervisors and colleagues—plays a meaningful role in shaping **employee commitment**, though its impact varies depending on organizational and cultural factors. **Tuna and Aslan (2018)**, studying teachers in Turkey, found a **significant but low positive correlation** between perceived social support and organizational commitment, with social support explaining only 3% of the variance. Teachers received the most support from spouses and the least from students, and their strongest commitment was to internalizing organizational values. This suggests that while social support enhances commitment, its effect may be limited when other factors such as personal motivation and job satisfaction dominate. In Nigeria, **Olatunji et al. (2017)** examined library staff in private universities and discovered a **positive and significant relationship** between social support and work commitment ($r = .111, p < 0.05$). Employees who felt supported by peers and supervisors were more committed to their jobs. However, barriers such as poor welfare, inadequate funding, and lack of modern equipment weakened overall commitment—implying that social support must be complemented by organizational improvements to sustain loyalty. **Jean and Mathurin (2021)**, studying microfinance employees in Cameroon, found that while **emotional and professional support** strengthened employee loyalty, it did not directly increase organizational commitment. In fact, a **negative relationship** emerged between loyalty and commitment, likely due to sector-specific challenges. The study concluded that social support fosters loyalty but must be reinforced with engagement and satisfaction initiatives to translate into lasting commitment. Overall, these studies indicate that **social support enhances emotional and professional well-being**, but its influence on employee commitment depends on broader workplace conditions and the presence of complementary organizational factors.

Initiated Interdependence and Employee Commitment

The concept of **initiated interdependence**—where employees depend on one another to complete tasks

and achieve outcomes—plays a crucial role in enhancing employee commitment by promoting collaboration, responsibility, and mutual trust within organizations. **Zhang et al. (2022)** investigated this dynamic within the context of **high-commitment work systems (HCWS)** and found that **task interdependence** strengthens workplace friendships and employee well-being. Using data from 253 employees, the study revealed that interdependence not only enhanced the positive effects of HCWS on well-being but also fostered informal relationships that deepened employees' sense of belonging and commitment. These findings suggest that beyond formal HR practices, the **informal bonds created through interdependence** significantly boost employee loyalty and satisfaction. Similarly, **Sahu (2018)**, in a study of 635 insurance executives, discovered that **job interdependence** positively influenced employee behavior and commitment. Interdependent work structures encouraged teamwork, accountability, and positive job behavior, leading to stronger commitment and improved performance—particularly in customer service roles. Interestingly, organizational support had less influence on employee behavior than interdependence and empowerment, highlighting the unique power of collaborative relationships in shaping commitment. Overall, these studies show that initiated interdependence strengthens employee commitment by fostering cooperation, shared purpose, and interpersonal connections that go beyond formal organizational structures.

External Interaction and Employee Commitment

External interaction—the relationships and exchanges employees maintain outside their organization—plays a crucial role in influencing employee commitment by shaping engagement, job satisfaction, and performance. The nature and effects of these interactions depend on factors like job design, interaction type, and employee demographics. **Rameshkumar (2020)**, studying Indian ship officers, found that employee engagement—driven by both internal and external factors—positively affected **affective** (emotional attachment) and **normative** (moral obligation) commitment, though not **continuance** commitment. This suggests that meaningful external interactions enhance emotional and moral bonds to the organization by increasing employees' sense of involvement and purpose. **Gotautaitė and Bučiunienė (2015)** examined bank employees and found that while external interaction did not directly increase engagement, it **moderated the relationship between age and engagement**. Older employees with more external interactions reported higher engagement levels, suggesting that such interactions help maintain relevance, vitality, and organizational commitment among aging workers.

Srisuthisa-ard (2015) explored employee-public interactions among service workers in Thailand, revealing that **positive external interactions**—like customer gratitude and cooperation—boosted job satisfaction and proactive service behavior, strengthening commitment. In contrast, **negative interactions** such as customer mistreatment led to emotional strain but did not necessarily weaken commitment when employees had effective coping and organizational support systems. Overall, the evidence suggests that external interactions, particularly positive and meaningful ones, can enhance employee engagement and strengthen commitment. Even in challenging contexts, supportive organizational structures can help employees maintain loyalty and performance despite negative external experiences.

Feedback from Others and Employee Commitment

Feedback from others—whether from supervisors, peers, or subordinates—plays a vital role in shaping employee commitment by influencing how employees view their roles, relationships, and growth within an organization. The nature, frequency, and quality of feedback can either strengthen or weaken employees' sense of belonging and loyalty. **Ok and Vandenberghe (2016)**, using social exchange theory, found that organizational commitment is positively linked to competence development but not necessarily to feedback-seeking behavior. Employees with strong career-oriented commitment—those focused on personal advancement—were less likely to seek feedback, while those with organizational commitment actively sought feedback to improve within the company. This suggests that aligning feedback systems with employees' career motivations can strengthen commitment and engagement. **Eva et al. (2019)** examined feedback from both supervisors and coworkers and found that supervisor feedback enhances work engagement, which in turn promotes

innovative behavior and organizational commitment. Coworker feedback, meanwhile, helps **buffer the effects of insufficient supervisor feedback**, maintaining engagement and psychological connection to the organization. The study highlights the importance of cultivating a **multisource feedback culture** to sustain motivation and innovation. **Rivera et al. (2024)** investigated **real-time feedback mechanisms** across more than 11,000 instances and found that employees who actively **seek feedback** tend to receive more detailed, qualitative comments—even if their scores are lower. These employees value actionable insights over ratings and remain motivated to seek feedback continuously, viewing it as a tool for self-improvement and growth. This proactive approach reflects **a deeper form of commitment**, as employees demonstrate dedication to learning and development within the organization. Overall, these studies collectively show that feedback—especially when meaningful, frequent, and multidirectional—serves as a critical driver of employee engagement, innovation, and long-term commitment to organizational goals.

Tools and Methods

The research design used by researchers consists of a descriptive cross sectional design with the approach of a survey. Survey in which the researcher used primary data gathered from four (4) alcoholic beverages sectors within the geographical location of Edo State. The population of this study includes diverse range of employees. eg employees at different ranks ranging from frontline workers to managers and executives positions. The population of this study was derived from four (4) alcoholic beverages sectors within Edo State, these firms includes Guinness sector in Ikpoba Slope, Nigeria breweries limited in Benin Auchi Road, Weo drinks in Ugbowo Benin City, Elixir drinks in Eyaen Benin City.

S/N	Sectors	Location	Population
	Guinness	Ikpoba Slope	455
	Nigeria Breweries Ltd.	Auchi Road	289
	Weo Drinks	Ugbowo	230
	Elixir Drinks	Eyaen	70
	Total		1044

Sources: Human Resources units(2025)

A sample size of 289 was determined using Taro Yamani's formula. 5point Likert Scale questionnaire was use and instrument was validated from the academia and business world.. While the Cronbach's alpha coefficient is a statistical measure that assesses the consistency and reliability of a set of items. A high Cronbach's alpha coefficient indicates that the items are highly reliable and consistent. Data were analyzed using descriptive statistics (means, standard deviations) and inferential statistics (regression analysis). The Correlation analysis was used to examine the relationships between social support, initiated independence, interaction from outside the organization, feedbacks from others, and employee commitment.

Results and Discussion

4.1 Demography of the Respondents

Table 4.1: Descriptive of the Respondents' Demography

Variables	Description	%
Gender	Male	47.30%
	Female	52.30%
Age	20 to 25 Years	55.40%
	25 to 30 Years	30.80%
	Above 30 Years	13.80%
Marital Status	Single	68.20%
	Married	20.00%
	Divorce	11.80%
Religion	Christianity	91.80%
	Islam	3.10%
	Others	5.10%
Years of Experience	1 to 9 Years	80.50%
	10 to 19 Years	15.90%
	20 to 29 Years	2.60%
	30 Years and Above	1.00%
Educational Status	SSCE	18.50%
	B.Sc	60.50%
	M.Sc	16.90%
	Ph.D	4.10%

Source: Field Survey, 2025

The demographic profile of the respondents, as shown in Table 4.1, reveals a slight female majority, with 52.3% of respondents being female and 47.7% male. The majority of participants are between the ages of 20 and 25 years (55.4%), followed by those aged 25 to 30 years (30.8%), while only 13.8% are above 30 years old. Regarding marital status, most respondents are single (68.2%), while 20.0% are married and 11.8% are divorced. In terms of religion, the vast majority identify as Christians (91.8%), with a small minority practicing Islam (3.1%)

or other religions (5.1%). The respondents' years of experience predominantly fall within the 1 to 9-year range (80.5%), with a smaller percentage having 10 to 19 years of experience (15.9%). Only a minor portion have 20 to 29 years of experience (2.6%) or over 30 years (1.0%). In terms of educational qualifications, most respondents hold a B.Sc degree (60.5%), while 16.9% possess an M.Sc, 18.5% have SSCE qualifications, and a small percentage (4.1%) hold a Ph.D.

Statistics of Variables Studied

Table 4.2: Social Support Statistics

Variables	Strongly Disagree	Disagree	Agree	Strongly Agree	Mean	Std. Deviation	Remark
I can develop friendship in my job	5.10%	8.70%	41.00%	45.10%	3.2615	0.82381	Agree
I can get to know other people in my job	7.70%	9.20%	45.60%	37.40%	3.1282	0.87283	Agree
I can meet with others in my work	7.20%	12.30%	41.00%	39.50%	3.1282	0.89037	Agree
My supervisor is concerned about the welfare of the people that work for him/her	6.70%	17.40%	42.60%	33.30%	3.0256	0.88187	Agree
The people I work with are friendly	7.70%	13.80%	52.30%	26.20%	2.9692	0.84285	Agree

Source: Field Survey, 2025

The social support statistics in Table 4.2 indicate a high level of agreement across the variables. A significant

majority of respondents strongly agree that they can develop friendships (45.1%) and get to know others

(37.4%) in theft jobs, with mean scores of 3.2615 and 3.1282, respectively. Furthermore, 39.5% strongly agree that they can meet with others at work, and 33.3% strongly agree that their supervisors care about

their welfare. While most employees agree that their colleagues are friendly (52.3%), the overall response suggests that social support within the workplace is perceived positively.

Table 4.3: Initiated Interdependence

Variables	Strongly Disagree	Disagree	Agree	Strongly Agree	Mean	Std. Deviation	Remark
The job requires me to accomplish my work before others complete theirs	10.30%	26.20%	38.50%	25.10%	2.7846	0.93873	Agree
Other jobs depend directly on mine	9.20%	33.80%	38.50%	18.50%	2.6615	0.88417	Agree
Unless my job gets done, other jobs cannot be completed	13.30%	31.30%	35.90%	19.50%	2.6154	0.94747	Agree
Completion of the job's activities is greatly affected by the work of other people	11.30%	25.10%	40.50%	23.10%	2.7538	0.93661	Agree
The job completion depends on the work of many different people	12.30%	16.40%	43.10%	28.20%	2.8718	0.96269	Agree
My work cannot be done unless others do their work	11.80%	35.40%	33.80%	19.00%	2.6	0.92725	

Source: Field Survey, 2025

Table 4.3, which addresses initiated interdependence, reveals a moderate level of agreement regarding the interdependence of tasks. A majority of respondents agree that their job requires them to finish their work before others (38.5%) and that other jobs depend on theirs (38.5%). The mean scores, ranging between 2.6154 and 2.8718, reflect this moderate agreement,

with slightly higher agreement levels for jobs requiring multiple people (43.1% agreed) and completion of work being interdependent (40.5% agreed). This suggests that while interdependence exists, it is not overwhelming, as agreement is not extremely strong across the board

Table 4.4: Interaction Outside the Organization

Variables	Strongly Disagree	Disagree	Agree	Strongly Agree	Mean	Std. Deviation	Remark
The job requires spending a lot of time with people outside my organization	10.30%	27.70%	33.80%	28.20%	2.8	0.96645	Agree
The job involves interaction with people who are outside my organization	8.70%	18.50%	50.80%	22.10%	2.8615	0.85934	Agree
On the job, I frequently communicate with people outside my organization	9.20%	21.00%	43.10%	26.70%	2.8718	0.91323	Agree
The job involves a great deal of interaction with people outside my organization	12.80%	18.50%	45.60%	23.10%	2.7897	0.94263	Agree

Source: Field Survey, 2025

Table 4.4 explores interaction outside the organization, showing that most respondents agree that their job involves significant external interaction. Approximately 50.8% agree that they regularly interact with people outside their organization, and 43.1% frequently communicate externally. The mean scores,

ranging between 2.7897 and 2.8718, indicate a general consensus that external interactions are a notable aspect of their job, though not universally intensive. This suggests that external communication is a routine, but not predominant, part of their work.

Table 4.5: Feedback From Others

Variables	Strongly Disagree	Disagree	Agree	Strongly Agree	Mean	Std. Deviation	Remark
I receive a lot of information about my job performance from my manager and co-workers	8.70%	9.70%	47.70%	33.80%	3.0667	0.88555	Agree

Other people in the organization, such as managers and co-workers, provide information on the effectiveness of my job performance (eg., quality and quantity)	6.70%	15.40%	49.70%	28.20%	2.9949	0.84033	Agree
I receive feedback on my performance from other people in my organization (e.g., managers and co-workers)	5.10%	15.40%	43.60%	35.90%	3.1026	0.84325	Agree

Source: Field Survey, 2025

In Table 4.5, feedback from others is examined, and the data reveal a positive trend toward receiving performance-related feedback. A substantial portion (47.7%) of respondents agree that they receive feedback from their managers and coworkers, with a mean score of 3.0667. The results indicate that feedback on job performance is prevalent, with 49.7%

of respondents agreeing that they receive information on the quality and quantity of theft work from others. The overall impression is that employees feel informed about their performance, with communication on effectiveness and performance being a regular occurrence.

Table 4.6: Employee Commitment

Variables	Strongly Disagree	Disagree	Agree	Strongly Agree	Mean	Std. Deviation	Remark
I value the organization's values	6.70%	11.80%	37.90%	43.60%	3.1846	0.88909	Agree
I am glad I chose to work for the organization	4.60%	14.40%	50.30%	30.80%	3.0718	0.79624	Agree
This organization has high work morale	5.10%	11.80%	45.60%	37.40%	3.1538	0.82295	Agree
My organization inspires me to give my best shot at work	5.10%	14.90%	40.00%	40.00%	3.1487	0.85761	Agree

Source: Field Survey, 2025

Table 4.6 focuses on employee commitment, which shows strong agreement with organizational values and a positive attitude toward the organization. Notably, 43.6% of respondents strongly agree that they value their organization's values, with a mean score of 3.1846, indicating a strong alignment with the company's mission. Additionally, 50.3% agree that they are glad to have chosen the organization, and 40% feel inspired to give their best, reflecting a high level of organizational commitment and morale. Overall, the responses suggest that employees are deeply engaged and committed to their work and the organization.

Inferential Statistics

The hypotheses underlying this study are tested with the probability (prob.) values from the correlation analysis carried out. When probability value is less than 0.01, then the alternate hypothesis is accepted. Otherwise, the null hypothesis is accepted; this serves as a decision rule.

Hypothesis One

H₀₁: There is no significant influence of social support on

employee commitment in firms. Table 4.7: Relationship between Employee Commitment and Social Support

		Employee Commitment	M	SD
Social Support	Pearson Correlation	.425**	3.1397	0.6595
	Sig. (2tailed)	0.000		
	N	289		

**** Correlation is significant at the 0.01 level (2-tailed)**

Computed From SPSS(2025)

The test of the first hypothesis examines the relationship between social support and employee commitment. With a Pearson correlation coefficient of 0.425, the result shows a moderate positive relationship between social support and employee commitment, indicating that as social support increases, employee commitment tends to rise. The significance value of 0.000 is less than the threshold of 0.01, leading to the

rejection of the null hypothesis. Therefore, the alternate hypothesis is accepted, concluding that there is a significant influence of social support on employee commitment in firms.

Hypothesis Two

H₀₂: There is no significant effect of initiated interdependence on employee commitment in firms

Table 4.8: Relationship Between Employee Commitment and Initiated Interdependence

		Employee Commitment	M	SD
Initiated Interdependence	Pearson Correlation	.279**	2.7145	0.62521
	Sig. (2tailed)	0.000		
	N	289		
** Correlation is significant at the 0.01 level (2-tailed)				

Computed From SPSS(205)

The second hypothesis tests the effect of initiated interdependence on employee commitment. The Pearson correlation coefficient is 0.279, indicating a weak but positive relationship between initiated interdependence and employee commitment. The significance value of 0.000, which is less than 0.01, prompts the rejection of the null hypothesis and

acceptance of the alternate hypothesis, suggesting that initiated interdependence has a significant effect on employee commitment in firms.

Hypothesis Three

H₀₂: There is no significant influence of the extent of interaction outside the organization on employee commitment in firms

Table 4.9: Relationship Between Employee Commitment and Interaction Outside the Organization

		Employee Commitment	M	SD
Interaction Outside the Organization	Pearson Correlation	.414**	2.8308	0.67747
	Sig. (2tailed)	0.000		
	N	289		
** Correlation is significant at the 0.01 level (2-tailed)				

Computed From SPSS(2025)

For the third hypothesis, the analysis investigates the relationship between interaction outside the organization and employee commitment. The Pearson correlation coefficient of 0.414 demonstrates a moderate positive relationship, indicating that greater interaction outside the organization is associated with higher employee commitment. The significance value of 0.000 is less than 0.01, leading to the rejection of the

null hypothesis. Thus, the alternate hypothesis is accepted, confirming that there is a significant influence of interaction outside the organization on employee commitment.

Hypothesis Four

H₀₄: There is no significant impact of feedback from others on employee commitment in firms

Table 4.10: Relationship Between Employee Commitment and Feedback From Others

		Employee Commitment	M	SD
Feedback From Others	Pearson Correlation	.489**	3.0547	0.65486
	Sig. (2tailed)	0.000		
	N	289		
** Correlation is significant at the 0.01 level (2-tailed)				

Computed From SPSS(2025)

The fourth hypothesis assesses the impact of feedback from others on employee commitment. The Pearson correlation coefficient is 0.489, showing a moderate to strong positive correlation, indicating that increased feedback from others is associated with higher employee commitment. Since the significance value is 0.000, which is less than the 0.01 threshold, the null hypothesis is rejected, and the alternate hypothesis is accepted. This confirms that feedback from others has a significant impact on employee commitment.

Discussion of Findings

Social Support and Employee Commitment

Social support plays a vital role in strengthening employee commitment across organizations. Employee commitment generally comprises three dimensions—**affective, continuance, and normative commitment**—and research consistently shows that

social support enhances particularly the affective and normative forms. When employees feel supported by supervisors and colleagues, they develop stronger emotional attachments and a sense of loyalty toward their organization. Findings from the current study in the alcoholic beverage sector **revealed a** moderate positive correlation ($r = 0.425$, $p = 0.000$) between social support and employee commitment. This statistically significant relationship indicates that as employees receive more social support, their level of commitment increases. Employees also reported that supervisors showed genuine concern for their welfare (mean = 3.03), underscoring the importance of perceived supervisory support in driving commitment. Supporting evidence from other studies reinforces these results. Xanthopoulou et al. (2021) found that supervisor and peer support in the hospitality industry enhanced affective commitment by increasing job

satisfaction and reducing stress. Eisenberger et al. (2019) similarly reported that perceived organizational support in manufacturing firms improved both affective and normative commitment, as employees felt valued and cared for. Furthermore, Halbesleben's (2022) meta-analysis confirmed that workplace social support not only boosts commitment but also enhances job satisfaction, performance, and organizational citizenship behavior, especially in high-stress environments. Overall, social support fosters a sense of belonging, well-being, and shared purpose among employees—key drivers that sustain their loyalty, motivation, and long-term commitment to the organization.

Initiated Interdependence and Employee Commitment

Initiated interdependence—where employees rely on one another to complete tasks—plays a meaningful role in shaping employee commitment. In highly interdependent workplaces, affective commitment increases as employees develop stronger emotional bonds and a sense of belonging through collaboration. Continuance commitment also grows because employees perceive greater costs in leaving such interdependent systems, while normative commitment is strengthened by feelings of obligation toward coworkers in team-oriented environments. Findings from the current study revealed a Pearson correlation coefficient of **0.279 (p = 0.000)** between initiated interdependence and employee commitment, indicating a **weak to moderate but significant positive relationship**. This suggests that as interdependence increases, so does employee commitment, though other factors likely influence this relationship as well. Empirical evidence from prior studies supports these results. **Campion et al. (2022)** found that team-based interdependence in manufacturing significantly enhanced affective commitment, as reliance on team members fostered emotional bonds and loyalty. **Liu et al. (2021)** reported similar findings in healthcare, where interdependent teamwork led to stronger normative commitment due to shared responsibility and a sense of duty. Likewise, **Van Der Vegt and Janssen (2020)** observed that reciprocal interdependence in telecommunications boosted both affective and continuance commitment, as employees valued their team relationships and feared disrupting workflow by leaving. Overall, initiated interdependence promotes stronger emotional, moral, and practical attachment to organizations, reinforcing the idea that teamwork and mutual reliance are key drivers of employee commitment.

Interaction Outside the Organization and Employee Commitment

External interaction plays a crucial role in shaping employee commitment, particularly in industries such as manufacturing, distribution, and sales, where employees frequently engage with stakeholders outside the organization. In the alcoholic beverage sector, workers often interact with distributors, retailers, and regulatory bodies, serving as representatives of their organizations. These interactions foster a sense of pride, ownership, and responsibility, which can strengthen organizational commitment—though excessive pressure from such engagements can sometimes reduce it. Findings from the alcoholic beverage sector in Edo State reveal that employees experience a moderate level of external interaction, with many agreeing that their roles require frequent engagement with individuals outside the organization (mean ≈ 2.8). Correlation analysis indicates a moderate positive relationship between external interaction and employee commitment ($r = 0.414$, $p = 0.000$), suggesting that greater interaction with external stakeholders enhances commitment. Theoretically, Social Exchange Theory explains this relationship by emphasizing reciprocal value in relationships—employees who see themselves as vital links between their organization and its environment tend to feel more committed. Frequent external engagement can also create relational contracts characterized by trust and loyalty, deepening employees' attachment to the organization. Supporting studies reinforce these findings. Shen and Benson (2021) found that retail employees with frequent customer and supplier interactions developed stronger affective commitment through increased pride and ownership. Gibson and Yao (2022) reported that long-term external relationships in logistics fostered normative commitment, driven by moral responsibility. Similarly, Van Der Vegt and Janssen (2020) showed that external interaction in telecommunications enhanced both affective and continuance commitment by increasing job satisfaction and perceived job importance. Overall, external interaction strengthens employees' sense of purpose, value, and loyalty—making it a significant factor in sustaining organizational commitment.

Feedback from Others and Employee Commitment

Feedback from others—whether from supervisors, peers, or external stakeholders—is a crucial mechanism that aligns individual performance with organizational goals. It helps employees understand their strengths, areas for improvement, and overall contribution to the organization, thereby enhancing their sense of value and belonging. Evidence from the alcoholic beverage sector in Edo State shows that employees frequently receive performance feedback, with a Pearson

correlation coefficient of 0.489 ($p = 0.000$), indicating a moderately strong positive relationship between feedback and employee commitment. According to the Job Characteristics Model (Hackman & Oldham, 1976), feedback strengthens motivation and achievement by improving employees' awareness of their performance outcomes. Empirical studies support this: Park and Cho (2022) found that supervisor feedback enhances affective commitment, Nguyen and Tran (2021) showed that peer feedback fosters normative commitment, and Guzman and Espejo (2020) demonstrated that regular feedback increases both continuance and affective commitment. Overall, feedback serves not only as a performance-enhancement tool but also as a key driver of motivation, loyalty, and sustained employee commitment.

Conclusion

This study demonstrated that job social characteristics play a vital role in shaping employee commitment within the alcoholic beverage sector in Edo State. Social support, initiated interdependence, interaction outside the organization, and feedback from others all positively contribute to employees' commitment to their firms. Therefore, when employees experience meaningful social interactions and support in their work environment, their loyalty, motivation, and

attachment to the organization increase. Cultivating a socially supportive work atmosphere is necessary in order to enhance commitment, reduce turnover, and improve overall organizational performance.

Recommendations

Firms should invest in creating a collaborative and supportive work environment through team-building exercises, mentorship programs, and encouraging open communication among employees and supervisors.

Companies should design work processes that enhance the interdependence of tasks by clearly defining roles and responsibilities, as well as promoting teamwork and joint accountability to foster a stronger sense of shared purpose.

- i. Managers should encourage and facilitate employees' engagement with external stakeholders, such as suppliers, customers, and industry partners, by offering opportunities for networking, professional development, and representation at external events.
- ii. Firms should implement regular and structured feedback mechanisms, such as performance appraisals, peer reviews, and informal check-ins, to provide employees with continuous insights on their performance and to foster a culture of open, constructive communication.

E-mail: Bello.adams@unidel.edu.ng

Publication Date: 2025/11/28

Abstract

This study examined the role of grievance on organizational performance in selected banks in Asaba, Delta State, Nigeria. The research specifically investigated how unfair treatment, poor working conditions, and discrimination affect organizational performance outcomes. Using a cross-sectional survey design, data were collected from 267 respondents across 16 banks through structured questionnaires, achieving a response rate of 93.7%. The study employed multiple linear regression analysis to test three hypotheses examining the relationships between grievance factors and organizational performance. The findings revealed significant negative relationships between all three grievance factors and organizational performance. Unfair treatment emerged as the strongest predictor ($\beta = -0.456, p < 0.000$), followed by poor working conditions ($\beta = -0.339, p < 0.000$) and discrimination ($\beta = -0.225, p < 0.000$). The regression model explained 67.4% of the variance in organizational performance ($R^2 = 0.674$), indicating strong explanatory power. All measurement instruments demonstrated excellent reliability with Cronbach's Alpha values ranging from 0.801 to 0.879. The study concluded that employee grievances significantly undermine organizational performance in Nigerian banks, with unfair treatment having the most detrimental effect. The research contributes to organizational justice theory and provides empirical evidence for the strategic importance of effective grievance management in banking organizations. The findings suggest that banks should prioritize the development of fair and transparent policies, improve working conditions, and implement comprehensive anti-discrimination measures to enhance organizational performance. This research provides valuable insights for banking sector management and establishes a foundation for future studies in developing country contexts.

Introduction

Background of the Study

Grievances management are an inevitable part of organizational life, as they arise from dissatisfaction or conflicts within the workplace. These grievances can stem from various issues, including unfair treatment, discrimination, poor communication, or unmet expectations. While organizations strive to create a harmonious work environment, unresolved grievances can significantly impact the overall performance and productivity of a business (McShane & Von Glinow, 2018).

Understanding the relationship between grievance management and organizational performance is crucial for organizations that aim to sustain growth and maintain high levels of employee morale. The purpose of this paper is to explore the roles grievance management on organizational performance, with an emphasis on how grievance management practices affect employee behavior, organizational culture, and operational efficiency. Grievances typically emerge when employees feel that their rights or interests have been violated, leading to feelings of injustice and resentment (Sharma & Sharma, 2016). If left

unaddressed, these grievances can escalate, affecting employees' mental health, job satisfaction, and productivity. Research has shown that unresolved grievances can contribute to high employee turnover, absenteeism, and low employee engagement, all of which ultimately harm organizational performance (Albrecht, 2014).

When employees feel valued and heard, they are more likely to be motivated and committed to their work. Conversely, unresolved grievances lead to demotivation, disengagement, and a decline in work quality. An important aspect of grievance resolution is the impact it has on organizational culture. When organizations fail to manage grievances effectively, it creates a toxic work environment characterized by mistrust, low morale, and a lack of cooperation among employees (Raineri & Pritchard, 2017). This type of environment can foster negative attitudes towards management, reduce communication, and hinder teamwork, all of which negatively affect performance. On the other hand, a proactive grievance management system fosters a culture of fairness, trust, and respect, leading to improved employee morale and performance (Kaufman, 2015).

In such environments, employees are more likely to feel motivated to contribute positively to the organization's objectives. Grievance management have a direct impact on motivation and engagement levels within an organization. When employees experience unresolved grievances, it can lead to reduced morale and a lack of enthusiasm for their work (Fisher & Newton, 2017). Low motivation can manifest in various forms, such as decreased productivity, poor-quality work, and absenteeism. Furthermore, employees who feel that their concerns are not being taken seriously by management may disengage from the organization, leading to higher turnover rates (Harter, Schmidt, & Hayes, 2002).

Statement of the Problem

In today's competitive business environment, the performance of an organization is significantly influenced by the satisfaction and engagement of its employees. One major factor that affects employee satisfaction is how grievances are managed within the workplace. Grievances, if not properly handled, can lead to low morale, reduced productivity, high employee turnover, and even industrial disputes, all of which adversely impact organizational performance.

Banks, being service-oriented institutions, rely heavily on human capital to drive their operations and deliver quality customer service. In cities like Asaba, Delta State, where the banking sector continues to grow and attract a diverse workforce, unresolved or poorly managed grievances can hamper internal cohesion and efficiency. Despite the importance of grievance handling mechanisms, there appears to be limited research focused on how these processes directly influence the overall performance of banks in this region.

Objectives of the Study:

The broad objective of this study is to examine the role of grievance on organizational performance a study of banks in Asaba. The specific objective are to :

- i. To examine the impact of workplace challenges on organizational performance.
- ii. To analyze the relationship between poor working conditions and organizational performance.
- iii. To investigate the effect of discrimination on organizational performance.

Hypotheses:

HO₁: Unfair treatment has a negative impact on organizational performance.

HO₂: Poor working conditions lead to a decrease in organizational performance.

HO₃: Discrimination negatively affects organizational performance.

Review of Related Literature

Conceptual Framework

The Concept of Grievance Management

Grievance management is a critical function in organizational development and human resource management, playing a significant role in enhancing organizational performance. A grievance refers to any discontent or dissatisfaction, whether expressed or not, whether valid or not, arising out of anything connected with the company that an employee thinks, believes, or even feels is unfair, unjust, or inequitable (Dessler, 2020).

Effective grievance management involves identifying, addressing, and resolving employees' complaints in a timely and fair manner. When managed appropriately, grievance mechanisms contribute to employee satisfaction, organizational commitment, and ultimately, improved productivity and performance. This paper explores the concept of grievance management, its components, and its role in enhancing organizational performance, supported by empirical evidence and theoretical insights. Grievance management encompasses the systematic handling of employee complaints and concerns through a well-structured process. It ensures that employees have a platform to express dissatisfaction and that their concerns are taken seriously.

According to Armstrong and Taylor (2020), grievance procedures are formal channels that allow employees to raise concerns related to work conditions, relationships with supervisors or colleagues, or company policies. The grievance management process generally includes: Receipt of the grievance, Investigation of the facts, Hearing the parties involved, making a decision, Communicating the decision to the parties, Taking corrective actions. Properly designed grievance mechanisms promote transparency, fairness, and trust within organizations, which are essential for maintaining a healthy work environment (Mathis, Jackson, Valentine, & Meglich, 2019).

The Importance of Grievance Management. Organizations that prioritize grievance management often experience lower turnover rates, increased employee morale, and higher levels of employee engagement. When employees feel their voices are heard and their concerns are addressed, they are more likely to remain loyal and committed to the organization (Robbins & Judge, 2019). Effective grievance handling also helps in identifying underlying problems in the organization, such as toxic leadership, unfair practices, or systemic issues that may otherwise go unnoticed. This proactive approach helps prevent escalation of conflicts and potential legal issues, saving organizations from reputational damage and financial losses (Gomez-Mejia, Balkin, & Cardy, 2016).

Grievance Management and Organizational Performance. Employee Satisfaction and Retention. One of the direct outcomes of effective grievance

management is enhanced employee satisfaction. Satisfied employees are more productive and less likely to leave the organization. A study by Kim and Lee (2012) found that grievance handling positively influences job satisfaction, which in turn impacts employee retention. Grievance management fosters open communication between employees and management. This transparency builds trust and facilitates a cooperative work environment.

Unfair Treatment

Unfair treatment in organizations continues to be a pressing issue that significantly impacts employee morale, engagement, and organizational effectiveness. It involves actions or behaviors that result in unjust or inequitable treatment of employees, often manifesting in discriminatory practices, favoritism, lack of recognition, and inequitable access to opportunities. In the current global context where diversity, equity, and inclusion (DEI) are central to organizational values, the persistence of unfair treatment reflects systemic challenges that require comprehensive solutions (Roberson, 2021). This review examines contemporary research (2020–2024) on unfair treatment in organizations, its effects, drivers, and strategies to mitigate its occurrence, using APA citation style.

Understanding Unfair Treatment

Unfair treatment encompasses perceived and actual discrimination in areas such as recruitment, pay, promotion, work assignments, disciplinary actions, and access to developmental opportunities. According to Begeny et al. (2020), perceived unfairness is often linked to systemic issues such as structural racism, unconscious bias, and a lack of inclusive leadership. These experiences are not limited to race and gender; they extend to age, sexual orientation, disability, and other identity categories (Mor Barak, 2023).

Theories such as organizational justice provide a framework for understanding unfair treatment. Organizational justice is generally divided into three dimensions: distributive justice (fairness in outcomes), procedural justice (fairness in processes), and interactional justice (fairness in interpersonal treatment) (Colquitt et al., 2021). When any of these dimensions are violated, employees perceive the environment as unjust, which can lead to negative organizational outcomes.

Impacts of Unfair Treatment

The impact of unfair treatment on individuals and organizations is profound. On an individual level, it leads to psychological distress, reduced job satisfaction, and disengagement. Employees who perceive unfair treatment are more likely to experience burnout and mental health challenges (Liu et al., 2021). For example, a study by Shore et al. (2020) found that experiences of exclusion and

marginalization significantly correlate with employee stress and decreased commitment.

From an organizational standpoint, unfair treatment negatively affects performance, innovation, and retention. A 2022 study by Gonzalez-Mulé et al. reported that unfair treatment contributes to lower productivity and higher turnover rates, as employees seek workplaces that offer respect and equitable treatment. Furthermore, it can damage organizational reputation, leading to difficulties in attracting diverse talent and increased legal liability (Roberson & Perry, 2022).

Current Trends and Case Examples

The COVID-19 pandemic and the subsequent shift to remote work have revealed and, in some cases, exacerbated inequities in treatment. Research by Stephens et al. (2021) indicates that marginalized employees were disproportionately affected during remote transitions due to limited access to resources and support systems.

One notable example is the 2020 lawsuit against Pinterest, in which former employees accused the company of systemic discrimination and retaliation. The case highlighted how toxic workplace culture and failure to address employee concerns can escalate into public scandals and legal action (Newton, 2020).

Another example includes Microsoft's continued efforts to audit and reform its internal processes. In its 2023 Diversity & Inclusion Report, the company shared progress in pay equity, increased representation of underrepresented groups in leadership, and transparent grievance mechanisms (Microsoft, 2023).

Poor working Condition

Poor working conditions remain a persistent and significant challenge in modern organizational management. These conditions—ranging from unsafe physical environments, long working hours, inadequate compensation, job insecurity, lack of resources, and poor interpersonal relations—negatively affect employee well-being and organizational performance. The COVID-19 pandemic has further highlighted vulnerabilities in workplace environments, sparking renewed global attention to occupational safety and health (OSH) standards (ILO, 2022). This review explores the causes, impacts, and potential remedies of poor working conditions in organizations, supported by recent scholarly research (2020–2024) and aligned with APA citation standards.

Defining Poor Working Conditions

Poor working conditions refer to environments where employees face physical, psychological, or organizational hazards that impair their health, safety, or job satisfaction. This includes, but is not limited to,

overcrowding, exposure to toxic materials, insufficient rest periods, emotional abuse, and lack of access to basic resources or personal development opportunities (Burgard & Lin, 2021). Often, these conditions are more prevalent in low-income industries or countries with limited labor regulations but are increasingly present in modern corporate contexts due to cost-cutting and exploitative practices (Bohle et al., 2021).

Physical and Psychological Effects on Employees

Exposure to poor working conditions has both immediate and long-term consequences for employee health. Physically, unsafe work environments can lead to injuries, chronic illnesses, and fatigue. Psychologically, employees experience burnout, anxiety, depression, and a diminished sense of purpose (Pfeffer, 2022). Research by Goh et al. (2020) confirms that workplace stress due to poor conditions is among the leading contributors to premature death in the United States.

A 2023 study by Kim and Wang revealed a direct correlation between noise pollution and stress levels in manufacturing settings, showing how subtle environmental factors significantly alter mental well-being. Similarly, inadequate rest periods and heavy workloads in the healthcare and logistics sectors during the COVID-19 crisis led to widespread burnout and attrition (Wu et al., 2021).

Organizational Consequences

Organizations that ignore working conditions face increased absenteeism, low employee engagement, high turnover, and declining productivity. According to a study by Eurofound (2022), firms with substandard working conditions are more likely to report reduced employee loyalty and higher recruitment costs. Additionally, poor working conditions can damage an organization's public image and expose it to legal risks.

Current Trends and Industry Responses

The pandemic has reshaped the discourse around working conditions. Employers are now under pressure to create healthier and more flexible environments. Remote work, hybrid models, and mental health initiatives have gained prominence, but implementation is uneven (Spurk & Straub, 2020).

In response to heightened awareness, many organizations have adopted the ISO 45001 Occupational Health and Safety Management System, which provides a global standard for maintaining a safe and healthy workplace (ISO, 2023). For example, Toyota implemented the standard across its plants, resulting in a measurable reduction in injuries and enhanced employee morale (Toyota Global, 2023).

Poor working conditions continue to pose serious health, social, and economic challenges for employees and employers alike. Despite advancements in technology and workplace design,

many organizations struggle to prioritize employee well-being due to financial constraints, weak regulations, or a lack of organizational will. The growing emphasis on ESG (Environmental, Social, and Governance) criteria and DEI (Diversity, Equity, and Inclusion) frameworks offers a strategic opportunity to embed safety and dignity at the core of organizational cultures. Addressing these issues not only protects employees but also enhances overall organizational resilience, reputation, and performance. Future research should focus on evaluating the long-term effectiveness of post-pandemic policy shifts in improving workplace conditions across sectors.

Discrimination in organizations

Discrimination within organizations remains a pressing concern despite extensive efforts to promote diversity, equity, and inclusion (DEI). Discriminatory practices can manifest through biases based on race, gender, age, disability, sexual orientation, religion, and other personal characteristics. Such practices not only harm individual employees but also undermine organizational cohesion, innovation, and overall performance (Roberson, 2022). This review explores the nature, causes, impacts, and solutions to discrimination in the workplace, drawing on recent scholarly works from 2020 to 2024 and adhering to APA citation standards.

Current Trends and Organizational Responses

Amid global social movements like Black Lives Matter and #MeToo, many organizations have intensified their focus on DEI initiatives. Companies are increasingly adopting DEI officers, mandatory bias training, and transparent reporting mechanisms to foster inclusive workplaces (Roberson, 2022).

However, research indicates that traditional diversity training alone is insufficient. Dobbin and Kalev (2021) argue that mandatory training can provoke backlash and suggest more effective strategies like voluntary programs and inclusive leadership development.

Technology-driven approaches are also gaining traction. Artificial intelligence (AI) tools are being used to detect biased language in job advertisements and to anonymize resumes during recruitment to reduce unconscious bias (Rabl et al., 2022).

Legal and Regulatory Frameworks

Legislation such as the Civil Rights Act (1964), the Americans with Disabilities Act (1990), and the more recent Equality Act (proposed 2021) aim to prohibit workplace discrimination. Many countries have updated or expanded anti-discrimination laws in recent years to cover new forms of bias, including algorithmic discrimination (European Commission, 2022).

Organizations found guilty of discriminatory practices face legal penalties, financial losses, and

reputational harm. Therefore, compliance with these frameworks is critical not only from a legal standpoint but also for long-term organizational success (Santuzzi et al., 2020).

Future Directions

Moving forward, organizations must adopt a systemic approach to tackle discrimination. This involves not only changing individual behaviors but also transforming organizational structures, norms, and practices. A 2023 report by the World Economic Forum emphasizes that organizations embedding equity and inclusion at the core of their strategic planning are better positioned for sustainable growth. Furthermore, scholars advocate for an intersectional approach, recognizing that individuals' experiences of discrimination are shaped by multiple, overlapping identities such as race, gender, class, and disability (Crenshaw, 2020). Incorporating intersectionality into organizational policies and research ensures a more comprehensive understanding and solution to discrimination.

Conclusion

Discrimination within organizations is a pervasive issue with significant personal and organizational consequences. Recent developments suggest growing awareness and efforts to combat bias, but significant challenges remain. Effective anti-discrimination strategies require holistic approaches that combine cultural change, leadership commitment, legal compliance, and systemic reforms. Addressing discrimination is not just a moral imperative; it is essential for creating resilient, innovative, and high-performing organizations.

The Relationship Between Unfair Treatment and Organizational Performance

Organizational performance is a critical determinant of an institution's success and sustainability. Among the myriad factors influencing performance, the perception of fairness—or lack thereof—within an organization plays a pivotal role. Unfair treatment, often conceptualized as organizational injustice, encompasses employees' perceptions of inequity in procedures, distributions, and interpersonal interactions. This review delves into the intricate relationship between unfair treatment and organizational performance, drawing upon recent empirical studies and theoretical frameworks to elucidate the mechanisms through which perceived injustice impacts organizational outcomes. Organizational injustice is typically categorized into three dimensions: distributive, procedural, and interactional justice. Distributive justice pertains to the perceived fairness of outcome distributions, such as pay and promotions. Procedural justice relates to the fairness of the processes that lead to outcomes, while interactional justice concerns the quality of interpersonal treatment during the implementation of

procedures (Ali & Mohammed, 2024). When employees perceive injustice in any of these dimensions, it can lead to adverse reactions that compromise organizational performance.

Perceived organizational injustice can lead to knowledge hiding behaviors, where employees intentionally withhold information that could be beneficial to the organization. Shoukat et al. (2024) found that in Pakistani private hospitals, perceived injustice indirectly affected organizational performance through knowledge hiding. Moreover, the presence of organizational politics and moral disengagement intensified this relationship, suggesting that an environment rife with unfairness and political maneuvering exacerbates detrimental behaviors.

The Relationship Between Poor Working Conditions and Organizational Performance

Organizational performance is intrinsically linked to the conditions under which employees operate. Poor working conditions—characterized by inadequate physical environments, excessive workloads, lack of managerial support, and insufficient resources—can significantly impede employee productivity, morale, and overall organizational effectiveness. This review explores the relationship between suboptimal working conditions and organizational performance, drawing upon recent empirical studies and theoretical frameworks to elucidate the mechanisms through which workplace environments influence organizational outcomes.

Defining Poor Working Conditions

Poor working conditions encompass a range of factors that negatively affect the work environment. These include, but are not limited to, inadequate lighting, poor ventilation, excessive noise, overcrowding, insufficient safety measures, and lack of necessary equipment. Additionally, organizational factors such as unclear job roles, lack of autonomy, insufficient recognition, and inadequate support from management contribute to a detrimental work environment (Akhtar, 2022).

Impact on Employee Health and Well-being

Substandard working conditions have been consistently linked to adverse health outcomes among employees. Chronic exposure to poor physical environments can lead to musculoskeletal disorders, respiratory issues, and increased stress levels. Psychologically, employees may experience burnout, anxiety, and depression, which in turn affect their productivity and engagement levels (Eskola et al., 2016). A study by the American Psychological Association (2023) highlighted that employees working in high-stress environments reported lower job satisfaction and higher turnover intentions.

Effect on Employee Performance

The quality of the work environment directly influences employee performance. A study conducted by Abdullahi et al. (2023) found a significant correlation between poor working conditions and decreased job performance among academic staff in Mogadishu. Employees subjected to unfavorable work environments exhibited lower motivation, reduced efficiency, and diminished commitment to organizational goals. Similarly, research by Ali et al. (2013) demonstrated that excessive workloads and inadequate resources negatively impacted employee productivity in the manufacturing sector.

Organizational Outcomes

Beyond individual performance, poor working conditions have broader implications for organizational outcomes. High employee turnover, increased absenteeism, and reduced customer satisfaction are common consequences of suboptimal work environments. Organizations may also face reputational damage, decreased profitability, and challenges in attracting top talent. The Gallup State of the Global Workplace report (2024) indicated that global employee engagement declined to 21%, with poor working conditions cited as a significant contributing factor.

The Relationship between Discrimination and Organizational Performance

Discrimination in the workplace—manifesting as biases based on race, gender, age, disability, or other protected characteristics—poses significant challenges to organizational performance. Despite global efforts to promote diversity, equity, and inclusion (DEI), discriminatory practices persist, undermining employee well-being, productivity, and overall organizational effectiveness. This review examines recent empirical studies and theoretical frameworks to elucidate the relationship between workplace discrimination and organizational performance.

Workplace discrimination encompasses unjust or prejudicial treatment of employees based on inherent characteristics such as race, gender, age, or disability. It can be overt, such as explicit exclusion from opportunities, or covert, including microaggressions and implicit biases. Discrimination adversely affects employee morale, engagement, and retention, thereby impacting organizational outcomes (Teymoori et al., 2023). Discriminatory environments hinder employee productivity. A study by researchers at Oklahoma State University and the University of South Carolina revealed that awareness of managerial bias—whether favorable or unfavorable—led to decreased productivity among employees. This suggests that perceived discrimination can demotivate employees, reducing their output and efficiency (The Journal of Blacks in

Higher Education, 2024). Discrimination negatively influences organizational commitment. In a national cross-sectional study in Iran, Teymoori et al. (2023) found a significant inverse relationship between workplace discrimination and organizational commitment among surgical technologists. Employees who perceived higher levels of discrimination exhibited lower levels of affective and normative commitment, which are critical for organizational stability and performance.

Theoretical Frameworks

Several theoretical models provide insight into the relationship between working conditions and organizational performance:

Job Demands-Resources (JD-R) Model: This model posits that job demands (e.g., workload, time pressure) and job resources (e.g., support, autonomy) influence employee burnout and engagement. Poor working conditions increase job demands while decreasing resources, leading to burnout and reduced performance (Demerouti et al., 2001).

Herzberg's Two-Factor Theory: According to Herzberg, hygiene factors (e.g., working conditions, salary) must be adequate to prevent employee dissatisfaction. Inadequate working conditions can lead to dissatisfaction, negatively impacting motivation and performance (Herzberg, 1966).

Social Exchange Theory: This theory posits that employees reciprocate the treatment they receive from their organization. Discriminatory practices breach the perceived social contract, leading to reduced commitment and performance (Cropanzano & Mitchell, 2005).

Organizational Justice Theory: This framework emphasizes the importance of fairness in organizational processes. Perceived injustice, including discrimination, can result in negative attitudes and behaviors among employees, adversely affecting performance (Colquitt et al., 2001). Grievance management is a critical aspect of human resource management that directly impacts organizational performance. It involves the processes and procedures through which employees can voice concerns or complaints, ensuring they are resolved fairly and timely. Effective grievance handling promotes a healthy work environment, reduces workplace conflict, and improves employee morale and productivity. The following theories provide a theoretical lens for understanding the relationship between grievance management and organizational performance.

Empirical Review

Grievance management—the formal and informal processes through which employees raise and organizations resolve complaints—has attracted growing empirical attention due to its demonstrated impact on key performance outcomes such as productivity, employee satisfaction, and organizational commitment. While theoretical models (e.g., Equity Theory, Psychological Contract Theory, Systems Theory) have long underpinned understanding of grievance dynamics, the past five years have seen a surge of quantitative studies across diverse contexts. This review distills empirical findings from 2020 to 2024, drawing primarily on four large-scale investigations in Bangladesh, Kenya, and beyond, to illustrate how effective grievance management bolsters organizational performance.

Tirno, Amin, and Chowdhuri (2020) conducted one of the first empirical examinations of grievance handling mechanisms within Bangladesh's Export Processing Zones (EPZs). Surveying 265 factory workers, they assessed four grievance-handling "styles" based on the Thomas–Kilmann model—collaborating, accommodating, compromising, and avoiding—and modeled their effects on overall Grievance Handling Mechanism (GHM) effectiveness via Structural Equation Modeling (Smart-PLS). All four styles positively influenced GHM effectiveness, but the collaborating style emerged as the single strongest predictor (β significant at $p < .01$). This style's emphasis on mutual problem-solving cultivated trust and teamwork, reducing resentment and fostering a harmonious work environment. Stakeholders in EPZs and similar industrial clusters should train supervisors in collaborative techniques—joint fact-finding, open dialogue, and shared decision-making—to optimize grievance resolution and, by extension, productivity and morale.

Aktar and Alam (2021) examined grievance-handling satisfaction among 284 garment workers across Dhaka, Gazipur, and Narayanganj, using the Management Dynamics in the Knowledge Economy survey instrument. They measured satisfaction across five dimensions of the grievance procedure (decision given, timeliness, follow-up, supervisor attitude, structural features) and linked these to overall satisfaction and productivity proxies via multiple regression. Four dimensions—decision quality, time taken, follow-up mechanisms, and supervisor attitude—each showed significant positive effects on overall satisfaction (β s ranging from .199 to .838, all $p < .001$). Structural features (e.g., formal documentation, appeals processes) did *not* predict satisfaction, suggesting procedural clarity alone is insufficient without human-centered responsiveness. Training managers to deliver timely, empathetic responses and maintain consistent follow-up can substantially elevate worker satisfaction—an

essential mediator of productivity and reduced turnover in high-pressure RMG environments.

Wesonga and Van Der Westhuizen (2024) shifted focus to the public sector, investigating 307 healthcare professionals at Longisa Referral Hospital in Bomet County, Kenya. Employing a census design and primary-data questionnaire, they analyzed the relationship between perceived effectiveness of grievance procedures and staff performance using Pearson correlation and Chi-square tests. A strong, positive correlation ($r = .547$, $p < .001$) was detected between employees' perceptions of grievance handling procedures and self-rated performance metrics. All three null hypotheses regarding independence between grievance handling and performance were rejected via Chi-square ($p < .01$). Even in resource-constrained public hospitals, sound grievance procedures—characterized by transparency, timeliness, and fairness—can substantively enhance staff motivation and performance, underscoring grievance management as a vital HR lever in healthcare settings (Wesonga & Van Der Westhuizen, 2024).

Methodology

Research Design

This study employed a cross-sectional survey research design to obtain data from a subset of the target population at a specific point in time. This design was selected due to its efficiency within the time constraints and its cost-effectiveness. Furthermore, cross-sectional studies are widely utilized in organizational and management research due to their ability to capture data across a broad respondent base without longitudinal commitment (Kumar, 2023; Saunders et al., 2023).

Research Population and Sampling Size

The population of this study comprises 995 core staff members from the head offices of selected banks located in Asaba, Delta State, Nigeria. The population data were obtained from the Human Resources departments of the respective banks.

To ensure representativeness and minimize bias, a probability random sampling technique was used. This method affords every individual an equal chance of selection, thereby enhancing the generalizability of findings (Creswell & Poth, 2023). However, for a more precise sample size, the sample size was determined using the Taro Yamen's sample size formula thus:

$$n = \frac{N}{1 + N(e)^2}$$

Where: n = sample size sought
e = level of significance
N = population size

$$n = \frac{995}{1 + 995(0.05)^2}$$

$$n = \frac{995}{995}$$

$$1 + 995 (0.0025)$$

$$n = \frac{995}{3.4875} = 285$$

Therefore, the sample size of 285 staff of the selected Banks was sampled as stated in Table 3.1

TABLE 3.1 PROPORTION SAMPLE SIZE FROM EACH BANK

SN	Banks	Population Head office	Apportionment (Head Office and Delta)
1	Access bank	70	$(70/995) \times 285 = 20$
2	Diamond bank	50	$(40/995) \times 285 = 11$
3	Eco bank	150	$(150/995) \times 285 = 43$
4	FCMB	60	$(60/995) \times 285 = 17$
5	Fidelity bank	40	$(40/995) \times 285 = 11$
6	First bank	80	$(80/995) \times 285 = 24$
7	GTB	40	$(40/995) \times 285 = 11$
8	Keystone bank	40	$(40/995) \times 285 = 11$
9	Standard Chartered Bank	30	$(30/995) \times 285 = 9$
10	polaris bank	30	$(30/995) \times 285 = 9$
11	StanbicIBTC Bank	30	$(30/995) \times 285 = 9$
12	Sterling bank	30	$(30/995) \times 285 = 9$
13	UBA	100	$(100/995) \times 285 = 31$
14	Union bank	80	$(80/995) \times 285 = 20$
15	Wema bank	25	$(25/995) \times 285 = 7$
16	Zenith bank	150	$(150/995) \times 285 = 43$
	Total	995	285

Source: Human Resource Units of respective banks (2024)

Method of Data Collection

Primary data were collected using a self-administered questionnaire to assess variables outlined in the study hypotheses. This method ensures first-hand, unbiased data (Mugenda & Mugenda, 2023). Questionnaires were chosen due to their wide reach, affordability, and ease of standardization (Bryman & Bell, 2023). Structured using closed-ended questions, the instrument was designed to capture responses aligned with the research objectives. Respondents were allowed two weeks to complete and return the instrument, with follow-up visits by the researcher for collection.

Method of Data Analysis

The data collected were analyzed using multiple linear regression, appropriate for assessing the influence of independent variables on the dependent variable. The likert-scale format meets the interval scale requirement for regression analysis. The assumption of independence among observations was maintained (Hair et al., 2023). SPSS Latest version was used for analysis.

Research Instrument

A structured questionnaire served as the primary instrument for data collection. It incorporated the Likert five-point scale, ranging from:

- Strongly Agree = 5
- Agree = 4
- Disagree = 3
- Strongly Disagree = 2
- Undecided = 1

The questionnaire incorporated the sub variables of grievance management

Approval for data collection was obtained through an introduction letter from the Department of Business Administration, Delta State University, Abraka.

Validity and Reliability

Validity was ensured via expert review from academics in the Department of Business Administration. Both face and content validity were evaluated to ensure the items represented the intended constructs (Saunders et al., 2023).

Reliability was assessed using the test-retest method with a three-week interval, consistent with Hair et al. (2023) recommendations. Cronbach's Alpha values ≥ 0.70 were deemed acceptable, ensuring internal consistency (Sekaran & Bougie, 2023).

Model Specification

Research Model Specification (Independent Variables)

Fig 3.1. Conceptual Model (Diagram)

Source: Researcher's Model, 2025

Each of the three independent variables is hypothesized to negatively influence organizational performance.

Mathematical Model (Multiple Linear Regression)

$$ORGP = \beta_0 + \beta_1 UFTR + \beta_2 PWCN + \beta_3 DSCR + \mu$$

$$ORGP = \beta_0 + \beta_1 UFTR + \beta_2 PWCN + \beta_3 DSCR + \mu$$

Where:

ORGP = Organizational Performance (Dependent Variable)

UFTR = Unfair Treatment

PWCN = Poor Working Conditions

DSCR = Discrimination

β_0 = Intercept

$\beta_1 - \beta_3$ = Coefficients for independent variables

μ = Error term

A Priori Expectations (Signs of Coefficients)

$\beta_1 < 0$: Unfair treatment is expected to negatively affect performance.

$\beta_2 < 0$: Poor working conditions are expected to reduce performance.

$\beta_3 < 0$: Discrimination is expected to negatively impact performance.

Model Interpretation

This research model investigates how internal workplace issues contribute to a decline in organizational performance. It assumes that the presence of these three negative workplace factors independently and collectively worsens outcomes in the organization.

Data Analysis and Interpretation

Introduction

This chapter presents the results of the empirical investigation into the role of grievance management and organizational performance in selected banks in Asaba, Delta State, Nigeria. The analysis is structured to address the three specific objectives and test the corresponding hypotheses formulated in Chapter One. The data were collected from 285 respondents across 16 banks using a structured

questionnaire and analyzed using multiple linear regression analysis via SPSS. The chapter is organized into sections covering response rate, demographic characteristics, descriptive statistics, correlation analysis, regression results, and hypothesis testing.

Hypothesis Testing and Interpretation

Hypothesis One: Unfair Treatment and Organizational Performance

H₀₁: Unfair treatment has no significant impact on organizational performance
H₁₁: Unfair treatment has a significant negative impact on organizational performance

The regression results show that unfair treatment has a significant negative impact on organizational performance ($\beta = -0.456$, $t = -6.683$, $p < 0.000$). This indicates that for every unit increase in unfair treatment, organizational performance decreases by 0.456 units, holding other variables constant. The t-statistic of -6.683 is highly significant, leading to the rejection of the null hypothesis.

The standardized coefficient indicates that unfair treatment has the strongest individual impact on organizational performance among the three grievance factors. This finding aligns with organizational justice theory, which suggests that perceptions of unfair treatment significantly affect employee attitudes and behaviors, ultimately impacting organizational outcomes.

Hypothesis Two: Poor Working Conditions and Organizational Performance

H₀₂: Poor working conditions have no significant impact on organizational performance
H₁₂: Poor working conditions have a significant negative impact on organizational performance

The analysis reveals that poor working conditions significantly and negatively affect organizational performance ($\beta = -0.339$, $t = -5.138$, $p < 0.000$). This suggests that each unit increase in poor working conditions results in a 0.339 unit decrease in organizational performance, ceteris paribus. The

highly significant t-statistic provides strong evidence to reject the null hypothesis.

This finding supports the job characteristics model and environmental psychology theories, which emphasize the importance of favorable working conditions for employee well-being and performance. Poor working conditions create stress, reduce job satisfaction, and ultimately diminish organizational effectiveness.

Hypothesis Three: Discrimination and Organizational Performance

H₀₃: Discrimination has no significant impact on organizational performance **H₁₃: Discrimination has a significant negative impact on organizational performance**

The regression results demonstrate that discrimination significantly and negatively impacts organizational performance ($\beta = -0.225$, $t = -3.596$, $p < 0.000$). This indicates that every unit increase in discrimination leads to a 0.225 unit decrease in organizational performance, holding other factors constant. The significant t-statistic provides sufficient evidence to reject the null hypothesis. While discrimination shows the smallest coefficient among the three variables, its impact remains statistically significant and practically meaningful. This finding supports social identity theory and diversity management literature, which emphasize the detrimental effects of discriminatory practices on organizational climate and performance.

Model Diagnostics and Assumptions

Table 4.7: Model Diagnostic Tests

Test	Result	Interpretation
Durbin-Watson	1.89	No autocorrelation
Kolmogorov-Smirnov	0.067 (p = 0.082)	Normality assumption met
Breusch-Pagan	2.34 (p = 0.126)	Homoscedasticity assumption met
VIF (Maximum)	2.31	No multicollinearity concern

The diagnostic tests confirm that the regression model meets all key assumptions. The Durbin-Watson statistic of 1.89 indicates no serious autocorrelation problem. The Kolmogorov-Smirnov test (p = 0.082) suggests that the residuals are normally distributed. The Breusch-Pagan test (p = 0.126) indicates homoscedasticity, and the VIF values (all below 3.0) confirm the absence of severe multicollinearity.

Discussion

The empirical findings from this study of 267 bank employees across 16 banks in Asaba, Delta State provide substantial evidence for the detrimental role of grievances management on organizational performance. The results demonstrate robust statistical relationships that align with established theoretical frameworks while offering important practical insights for banking sector management.

The study's methodological approach reflects best practices in business research. The 93.7% response rate exceeds the standards recommended by Bryman and Bell (2023), who emphasize that high response rates are crucial for reducing non-response bias and ensuring representative findings. The reliability analysis, with Cronbach's Alpha values ranging from 0.801 to 0.879, surpasses the 0.70 threshold recommended by Hair et al. (2023), confirming the internal consistency of the measurement instruments. This methodological rigor, consistent with Kumar's (2023) guidelines for quantitative research, strengthens confidence in the study's conclusions.

The multiple linear regression analysis explains 67.4% of the variance in organizational performance ($R^2 = 0.674$), indicating substantial explanatory power. According to Hair et al. (2023), this level of explained variance represents a strong model that captures the majority of factors influencing the dependent variable. The diagnostic tests confirm that key assumptions for parametric analysis were met, supporting the validity of the regression results as outlined by Sekaran and Bougie (2023).

The findings strongly support organizational justice theory, with unfair treatment emerging as the most significant predictor of organizational performance ($\beta = -0.456$). This aligns with Saunders et al.'s (2023) emphasis on the importance of procedural and

distributive justice in organizational contexts. The negative relationship between poor working conditions and performance ($\beta = -0.339$) supports environmental psychology theories, while the discrimination-performance relationship ($\beta = -0.225$) validates social identity theory predictions.

These results resonate with broader performance management literature. Jyothibabu et al. (2016) emphasized that organizational learning and employee satisfaction are fundamental to performance improvement. The current findings extend this understanding by demonstrating how grievance factors systematically undermine performance through their impact on employee attitudes and behaviors. Similarly, Eyup et al. (2017) highlighted the importance of organizational capabilities in driving performance, with the current study revealing how grievance management represents a critical organizational capability.

The results have immediate practical relevance for Nigerian banking organizations. Nwanzu (2018) noted the unique challenges facing Nigerian firms in developing effective performance measures, and this study provides empirical evidence for prioritizing grievance management as a performance improvement strategy. The strong negative correlations suggest that addressing these issues should be a strategic priority rather than merely an HR function.

The predominance of unfair treatment as the strongest predictor indicates that banks should focus on establishing transparent, consistent policies and procedures. This finding supports Sanchez's (2004) competence-based management framework, which emphasizes the importance of developing organizational capabilities that enhance employee engagement and performance. The significant impact of working conditions suggests that environmental improvements could yield substantial performance gains, particularly relevant in the post-COVID banking environment.

Following Creswell and Poth's (2023) guidelines for research design, the study's cross-sectional approach provides valuable insights while acknowledging limitations regarding causal inference. The reliance on self-reported measures, while capturing important subjective experiences, may introduce common method bias as noted by Mugenda and Mugenda (2023). Future research could benefit from incorporating objective

performance measures and longitudinal designs to strengthen causal claims.

The study makes a significant contribution to understanding grievance-performance relationships in developing country contexts. The robust statistical evidence, combined with strong theoretical foundations, provides banking organizations with clear guidance for improving performance through effective grievance management. The findings underscore that addressing employee grievances is not merely a matter of employee welfare but a strategic business imperative that directly impacts organizational effectiveness and competitiveness in the Nigerian banking sector.

Summary, Conclusion and Recommendations

Summary of Findings

This final chapter provides a comprehensive summary of the research findings, draws conclusions based on the empirical analysis, and presents recommendations for banking organizations and future research. The chapter also highlights the study's contribution to knowledge in the field of grievance management and organizational performance. The research investigated the role of grievance management and organizational performance in selected banks in Asaba, Delta State, Nigeria, with specific focus on unfair treatment, poor working conditions, and discrimination as key grievance factors.

This study employed a quantitative research approach to examine the relationship between grievances management and organizational performance in the Nigerian banking sector. Data were collected from 267 respondents across 16 banks in Asaba, Delta State using a structured questionnaire. The research was guided by three specific objectives and corresponding hypotheses, all of which were tested using multiple linear regression analysis.

The study sample comprised a diverse group of banking professionals with a slightly higher proportion of male respondents (56.9%) compared to female (43.1%). The majority of participants were between 31-35 years of age (33.3%), held HND/Bachelor's degrees (70.0%), and had 6-10 years of work experience (39.7%). Middle-level employees constituted the largest group (50.2%), providing valuable insights from employees who are directly involved in operational activities while having sufficient organizational experience.

The empirical analysis revealed significant and negative relationships between all three grievance factors and organizational performance. The multiple linear regression model explained 67.4% of the variance in organizational performance ($R^2 = 0.674$), indicating strong explanatory power.

Conclusion

This study successfully achieved its primary objective of the role of grievance management and organizational performance in selected banks in Asaba, Delta State. The three specific objectives were fully addressed through rigorous empirical analysis:

The study confirmed that unfair treatment significantly and negatively affects organizational performance in banking organizations. This finding provides strong empirical support for organizational justice theory and highlights the critical importance of fair treatment in banking operations. The research established that poor working conditions have a significant negative impact on organizational performance. This finding underscores the importance of environmental factors in determining organizational effectiveness and employee productivity. The study demonstrated that discrimination significantly and negatively influences organizational performance. This finding emphasizes the detrimental effects of discriminatory practices on organizational climate and overall effectiveness.

The findings provide robust empirical support for several theoretical frameworks. The results align with organizational justice theory, which posits that employees' perceptions of fairness significantly influence their attitudes and behaviors (Bryman & Bell, 2023). The negative impact of poor working conditions supports the job characteristics model and environmental psychology theories, while the discrimination findings validate social identity theory predictions.

The study contributes to the growing body of literature on grievance management in developing country contexts, particularly in the African banking sector. The findings demonstrate that theoretical frameworks developed in Western contexts are applicable to Nigerian organizations, while also revealing context-specific patterns and relationships.

From a practical standpoint, the study conclusively demonstrates that employee grievances are not merely HR issues but strategic business concerns that directly impact organizational performance. The strong negative relationships observed suggest that banks cannot afford to ignore grievance management if they aim to maintain competitive advantage and operational effectiveness.

The finding that unfair treatment has the strongest impact on performance indicates that procedural and distributive justice should be prioritized in banking organizations. The significant effects of working conditions and discrimination further emphasize the need for comprehensive approaches to employee welfare and organizational culture management.

The banking industry's unique characteristics make these findings particularly significant. Banks operate in highly regulated environments where employee

behavior directly impacts customer service quality, regulatory compliance, and organizational reputation. The service-intensive nature of banking means that employee attitudes and behaviors significantly influence customer satisfaction and loyalty, making grievance management a critical business imperative.

The study reveals that banks in Asaba, Delta State face substantial challenges related to employee grievances, which may be exacerbated by the competitive nature of the banking industry, high-pressure work environments, and rapid technological changes. The relatively young workforce profile may also contribute to higher expectations for fair treatment and better working conditions.

Recommendations

Based on the empirical findings, the following recommendations are proposed for banking organizations in Nigeria:

Banks should develop robust grievance management systems that include clear policies, procedures, and timelines for addressing employee concerns. These systems should be easily accessible, transparent, and ensure confidentiality for complainants. Regular monitoring and evaluation of grievance trends should inform strategic HR decisions.

Given that unfair treatment emerged as the strongest predictor of organizational performance, banks should prioritize the establishment of fair and transparent policies across all HR functions. This includes: Standardized performance evaluation criteria and processes; Transparent promotion and career development pathways; Equitable compensation and benefits systems; Consistent disciplinary procedures. Regular training for managers on fairness and justice principles

Banks should invest in improving both physical and psychological working conditions through: Modernization of office infrastructure and technology; Implementation of flexible work arrangements; Provision of adequate resources and support systems; Development of work-life balance programs and Regular assessment of workplace safety and comfort

Contribution to Knowledge

This study makes several significant theoretical contributions to the fields of grievance management and organizational performance:

- i. The study provides robust empirical support for organizational justice theory, job characteristics model, and social identity theory in the context of African banking organizations. This validation extends the applicability of these theories beyond their original Western contexts.
- ii. The research quantifies the specific impact of different grievance factors on organizational

performance, providing precise coefficients that can inform theoretical models and practical applications. The finding that unfair treatment has the strongest impact ($\beta = -0.456$) provides new insights into the relative importance of different grievance factors.

- iii. The study's comprehensive approach to examining multiple grievance factors simultaneously contributes to a more nuanced understanding of how different types of grievances interact to influence organizational outcomes.
- iv. The research provides valuable insights into grievance-performance relationships in developing country contexts, particularly in the African banking sector, addressing a significant gap in the literature.
- v. The study demonstrates a methodologically rigorous approach to grievance research, with excellent response rates (93.7%), strong reliability measures, and comprehensive diagnostic testing. This provides a model for future research in similar contexts.
- vi. The research contributes validated measurement instruments for assessing grievance factors and organizational performance in banking contexts, which can be adapted for use in future studies.
- vii. The comprehensive multiple linear regression analysis, including thorough diagnostic testing, provides a robust analytical framework that can be replicated in similar studies.
- viii. The study provides banking organizations with evidence-based insights for developing effective grievance management strategies. The specific coefficients and relationships identified can guide resource allocation and priority setting.
- ix. The research offers a framework for understanding how grievance management can be leveraged as a performance improvement strategy, moving beyond traditional HR perspectives to strategic business considerations.
- x. The findings provide valuable insights specific to the Nigerian banking industry, addressing the unique challenges and opportunities in this sector.
- xi. The research provides empirical evidence that can inform policy development at both organizational and regulatory levels, supporting evidence-based decision making.

Suggestions for Future Research

Future studies should employ longitudinal designs to establish stronger causal relationships and examine how grievance-performance relationships evolve over time.

- i. Researchers should consider combining quantitative surveys with qualitative interviews,

- focus groups, and case studies to provide deeper insights into the mechanisms underlying grievance-performance relationships.
- ii. Future research should incorporate multiple data sources, including objective performance measures, supervisor ratings, and organizational records, to reduce common method bias and provide more comprehensive assessments.
- iii. Research should explore the mediating mechanisms through which grievances affect performance, such as job satisfaction, organizational commitment, turnover intentions, and employee engagement.
- iv. Studies should examine potential moderating factors such as organizational culture, leadership style, industry characteristics, and individual differences that may influence grievance-performance relationships.
- v. Comparative studies across different industries would enhance understanding of how industry characteristics influence grievance-performance relationships.
- vi. Studies comparing grievance-performance relationships across different cultural contexts would provide insights into the cultural specificity of these relationships.
- vii. Research comparing public and private sector organizations would provide insights into how organizational ownership and governance structures influence grievance management effectiveness

The Transformative Impacts of Generative Artificial Intelligence on Business Innovation

ODIA James¹ & OBOYO, Cletus

Department of Accounting,
University of Benin, Nigeria;
james.odia@uniben.edu

Publication Date: 2025/11/28

Abstract

The purpose of this paper was to examine the impacts of generative artificial intelligence (GenAI) on business innovation in the contemporary digital economy. GenAI defined by its capacity to produce new content such as text, images, and code has emerged as a pivotal technological advancement with significant implications for how businesses create, deliver, and manage value. The paper provides a conceptual overview of GenAI, it distinguishes it from traditional AI systems, and highlights the technological foundations that underpins its capabilities. The paper also explores business innovation through various lenses, including product, process, marketing, and organizational innovation, radical and incremental, and identifies how GenAI supports these forms across multiple industries. GenAI enables to increased efficiency, personalized services, enhanced decision-making and business innovation in various industries. The strategic benefits of GenAI include cost reduction, scalability, and accelerated development cycles, while ethical, legal, and managerial challenges include data privacy, intellectual property concerns, algorithmic bias, and workforce implications. The paper concludes with the dual role of GenAI as both a technological tool and a catalyst for business transformation, with potentials to redefine innovation strategies in the years ahead. It highlights emerging trends, such as multimodal models and autonomous systems, and the importance of ethical governance and strategic integration of GenAI within business frameworks.

Key words: Generative artificial intelligence, business innovation, GPT, GANs

Introduction

The rapid advancement of digital technologies continues to redefine the boundaries of innovation in contemporary business environments. Among these advancements, generative artificial intelligence (GenAI) has emerged as a transformative force, enabling machines to autonomously create original content such as text, images, audio, and software code (Dwivedi et al., 2023). Unlike traditional AI systems which are reactive and rule-based, GenAI utilizes deep learning, large language models (LLMs), and transformer architectures to produce human-like outputs based on learned patterns from vast datasets (Bommasani et al., 2022). Business innovation encompasses creating new products, services, processes, and business models which are key drivers of competitiveness and adaptability in a volatile global market (Hossain, 2023). As companies face increasing pressure to remain agile and customer-centric, the integration of GenAI into core business operations is gaining strategic significance. Platforms such as ChatGPT, DALL·E, and Google Gemini have enabled organizations to automate creativity, personalize customer interactions, and accelerate research and development cycles (Kaplan et al., 2023).

The intersection of GenAI and business innovation presents both opportunities and challenges. On one hand, the digital technologies offer substantial benefits such as increased efficiency, reduced costs, enhanced decision-making, and new value creation across diverse sectors such as healthcare, finance, marketing, and manufacturing (Tegmark et al., 2023). On the other hand, their adoption raises critical concerns related to data privacy, algorithmic bias, intellectual property rights, and workforce disruption (Liu & Sundararajan, 2024). The paper contributes to the ongoing discourse on digital transformation and emphasizes the need for businesses to balance innovation with ethical and regulatory accountability in the era of GenAI. The rest of the paper is structured into four sections. The immediate section provides a conceptual review of how GenAI models, characteristics and the technological foundations; Section three considers business innovation, including the types, drivers and strategic importance. Section four discusses the integration of GenAI into business innovation, strategic benefits of GenAI integration, and the ethical considerations, and technological challenges of adopting GenAI. Section five outlines the future trends and prospects, and offers suggestions for

responsible and sustainable integration of GenAI into business innovation frameworks. Section six is the conclusion.

Conceptualizing Generative AI

As AI technologies evolve, a distinct class of models known as GenAI has become increasingly prominent in both academic and industrial spheres. These models are not merely tools for automating structured tasks; rather, they are capable of producing original and contextually relevant content across various media formats-text, images, music, and code (Bommasani et al., 2022). The emergence of GenAI represents a significant leap in machine intelligence, enabling new forms of human-computer collaboration, creativity, and decision support. GenAI refers to a subset of AI models designed to generate new content that closely resembles human-created output, based on patterns learned from existing data (Luccioni & Viviano, 2023). GenAI differs fundamentally from traditional AI systems, which typically rely on pre-programmed rules or data classification. While conventional AI is predominantly task-specific and deterministic, generative models operate probabilistically, predicting the most plausible output given an input prompt (Dwivedi et al., 2023). These capabilities are made possible by large-scale neural network architectures, including transformer-based models trained on massive datasets, which allow machines to understand and replicate human-like language and patterns (Zhang et al., 2023).

The conceptual foundation of GenAI intersects with multiple domains-natural language processing (NLP), computer vision, reinforcement learning, and computational creativity. As such, GenAI is increasingly viewed not only as a technical advancement but as a paradigm shift in the way businesses approach innovation, communication, and knowledge generation (Kaplan et al., 2023). GenAI trains generative models on existing datasets and use them to create new data that resemble the original data (Kar et al., 2023). GAI leverages generative modeling and advancements in deep learning to create images, text, audio, and video (Dwivedi et al., 2023). Generative models can generate new creative content, improve analytics accuracy, or even create realistic virtual experiences (Kar & Kushwaha, 2023).

There are two main types of GenAI models: Generative Adversarial Network (GAN) and Generative Pre-trained Transformer (GPT) (Dwivedi et al., 2023; Gupta et al., 2024). The GAN employs two competing neural models to create new data - original and fake data from the authentic data (Lin et al., 2023), or create two neural models: a generator and discriminator model (Ding et al., 2022). The generator produces new data that resembles the original data, while the

discriminator differentiates between genuine and fake data. GANs learn through a process called "adversarial competition" (Ding et al., 2022), and find applications in image, and video synthesis, text generation (Kar et al., 2023), computer vision, gaming, and virtual reality (Man & Chahl, 2022), chatbots and automated writing (Lin et al., 2023).

GPT is a pre-trained generative model based on multilayer deep neural networks (Kar et al., 2023). The GPT is trained from large databases texts and codes to understand language, and generate new texts based on context. It relies on a single transformer model instead of a two models like GANs. ChatGPT is the most popular GPT released by Open AI in 2020, and it is able to create texts, translate language and generate creative contents. The versions of ChatGPT include GPT-3, and GPT-4. GPT-3 was released in November 2022 (Marr Bernard, 2023), and can generate coherent text and provide interactive responses to users' queries (Dengel et al., 2023). ChatGPT 4 represents the latest conversational AI model, developed by OpenAI and released in September 2023 (Marr Bernard, 2023), and can replicate text-to-image processing by harnessing Mid-journey's features in industrial automation (Hao Karen, 2023). To fully appreciate the impact of GenAI on business innovation, it is essential to understand the core characteristics, and operating principles.

Characteristics of Generative AI

GenAI are foundation models or large-scale pre-trained system such as GPT, BERT (Bidirectional Encoder Representations from Transformers), and diffusion models with diverse applications that range from Chatbots and writing assistants, to art generators, and software tools (Bommasani et al., 2022). One of the defining features of GenAI is its generativity or the ability to produce unique outputs from a single input or prompt. These outputs are not retrieved from a static database but are synthesized in real time using probabilistic reasoning and deep neural representations (OpenAI, 2023). Another characteristic is multimodality, which allows GenAI to process and generate content across various forms, such as combining text with images or converting textual instructions into visual outputs (Tegmark et al., 2023). Additionally, GenAI models are context-aware; they can maintain coherence across multiple sentences or stages of interaction, which enhances their utility in applications such as virtual assistance, automated content creation, and intelligent design (Liu & Sundararajan, 2024). Despite their remarkable capabilities, these models are not infallible. They often exhibit issues such as hallucinations (i.e., generating incorrect information), bias replication, and high computational resource demands (Zhou et al., 2024). Understanding these characteristics is fundamental to

assessing how GenAI can be strategically deployed to support or transform innovation processes in business environments.

Technological Foundations of GenAI

The rapid development and performance of GenAI models are underpinned by a convergence of several technological foundations, most notably deep learning, transformer architectures, large-scale pre-training, and self-supervised learning. These technologies collectively enable machines to model language, vision, and other data modalities with unprecedented accuracy and flexibility (Bommasani et al., 2022; Zhang et al., 2023). GenAI models use transformer architecture, which uses self-attention mechanisms to process sequences in parallel rather than sequentially (Vaswani et al., 2017). This architecture enhances GenAI's ability to learn long-range dependencies and context within data. For example, OpenAI's GPT series, Google's BERT, and PaLM utilize self-supervised learning to train on massive, unlabeled datasets; this allows them to generate coherent and contextual appropriate outputs from minimal prompts (OpenAI, 2023; Google Research, 2023).

A key enabler of GenAI is the availability of large-scale computational resources and data-rich environments, which facilitate the training of foundation models. These models serve as general-purpose systems that can be fine-tuned for specific downstream tasks, making them highly adaptable for different business applications (Dwivedi et al., 2023). The introduction of diffusion models, which generate images by learning to reverse the process of adding noise to data, has further expanded the generative capabilities beyond text to include high-quality visuals and audio content (Rombach et al., 2022). Moreover, advances in multi-modal learning have enabled generative models to integrate and process multiple data types—text, images, speech, and video—allowing for more sophisticated applications such as text-to-image generation, AI-based design tools, and virtual assistants (Liu & Sundararajan, 2024; Tegmark et al., 2023). These foundational technologies have collectively positioned GenAI as a cornerstone of future-oriented business innovation.

Examples of GenAI Tools and Platforms

Numerous GenAI tools and platforms have been released since 2022, offering powerful capabilities to businesses, developers, and end-users. Among the most notable is OpenAI's GPT-4, a LLM which can generate human-like text, engage in conversation, solve complex tasks, and support various applications such as customer service, content creation, and coding assistance (OpenAI, 2023). Similarly, Google's Gemini (formerly Bard) integrates text and image generation

into a single platform, leveraging Google's PaLM-2 model to provide advanced multi-modal functionality (Google Research, 2023).

In the realm of visual content, DALL·E 3 (by OpenAI) and Midjourney are popular for being able to generate high-resolution images from textual prompts. These tools have transformed creative industries by accelerating design processes, enabling rapid prototyping, and supporting personalized marketing (Kaplan et al., 2023; Luccioni & Viviano, 2023). Stability AI's Stable Diffusion has also democratized access to AI-generated visuals by offering open-source tools for artistic and commercial use (Rombach et al., 2022). For coding and software development, GitHub Copilot, powered by OpenAI's Codex, assists developers to generate code snippets, suggest documentation, and automate repetitive programming tasks (Zhou et al., 2024). In audio and video generation, tools like Synthesia and ElevenLabs are pioneering AI-driven avatars and synthetic voices for training, communication, and entertainment applications.

These platforms not only showcase the practical application of GenAI but also highlight its versatility across industries. From marketing and education to finance and healthcare, GenAI tools are redefining how businesses innovate, interact with consumers, and develop new offerings. The accessibility and scalability of these tools are major contributors to their growing integration into mainstream business operations.

Business Innovation: A Conceptual Overview

Business innovation is “the creation and implementation of novel ideas, processes, products, or business models that lead to measurable improvements in organizational performance, competitiveness, and value creation” (Hossain, 2023). In an era characterized by digital disruption, global uncertainty, and evolving consumer expectations, innovation has become very strategic for organizations that want to adapt and thrive. It is not confined to technological invention but encompasses a broader spectrum of organizational transformation—ranging from product design and service delivery to supply chain reconfiguration and customer engagement (OECD, 2023). From a strategic perspective, innovation enables businesses to respond to market demands, capture emerging opportunities, and gain competitive advantage. Organizations that embrace innovation are more likely to outperform peers in terms of growth, profitability, and resilience (Lindgren & Taran, 2022). The digital revolution has further expanded the scope of innovation, enabling firms to leverage data, AI, cloud computing, and the Internet of Things (IoT) to rethink value creation and operational models (Dwivedi et al., 2023).

Innovation is also increasingly collaborative, with firms engaging in open innovation ecosystems that

involve partnerships with startups, universities, and technology providers (Chesbrough, 2022). As such, business innovation is not only a function of internal capability but also of external knowledge integration and organizational agility. In this context, emerging technologies like GenAI offer new pathways for ideation, experimentation, and scalable transformation across industries. Understanding the nature and classification of innovation is essential for analyzing how GenAI can be integrated into business strategies. The following section outlines the major types of business innovation that organizations pursue.

Types of Business Innovation

There are basically four primary types or measures of innovation: product, process, marketing and organizational innovations (Gault, 2018; OECD, 2018). Beyond product innovation, GenAI can enable multiple forms of other innovation in process, marketing, organization, radical and incremental innovation (Mariani & Dwivedi, 2024). Product innovation involves the development of new or significantly improved goods or services. This includes enhancements in performance, functionality, or user experience that offer added value to customers (Lindgren & Taran, 2022). In the context of GenAI, product innovation could manifest in AI-enhanced applications, intelligent customer interfaces, or personalized recommendation systems. Process innovation focuses on improving production or delivery methods. It includes automation, optimization, or reengineering of workflows that increase efficiency and reduce costs (Hossain, 2023). GenAI supports process innovation through capabilities like automated content generation, predictive analytics, and intelligent document processing.

Marketing innovation pertains to new approaches in product promotion, distribution, and pricing strategies. It often involves the use of digital tools and platforms to reach customers in more effective and personalized ways (OECD, 2023). AI-generated marketing content, personalized messaging, and A/B testing optimization are examples of marketing innovation driven by generative technologies. Organizational Innovation refers to changes in organizational structure, management practices, or workplace culture that improve business performance. This may include adopting agile methods, remote work systems, or data-driven decision-making models (Chesbrough, 2022). GenAI tools can support these shifts by enabling collaborative ideation, streamlining internal communications, and enhancing strategic planning. In addition, contemporary scholars have identified other classifications or taxonomies such as; product/process, radical/incremental, architectural/component, open /closed, competence-

destroying/competence-enhancing, sustaining/disruptive etc. (Christensen, 2020; Mariani & Dwivedi, 2024), with each reflecting a different dimension of organizational change. incremental versus radical innovation, and innovation). Incremental innovation involves small, continuous improvements, while radical innovations introduce entirely new paradigms. Disruptive innovation often enabled by emerging technologies, redefines market standards and can displace established players. These diverse types of innovation collectively contribute to a firm's strategic agility and long-term sustainability. As the next section will demonstrate, GenAI has the potentials to support each of these innovation types, offering businesses both operational enhancements and new value propositions.

Drivers of Business Innovation in the Digital Era

The digital era has ushered in a new wave of innovation characterized by speed, connectivity, and continuous disruption. Several interrelated factors act as key drivers of innovation, influencing how businesses adapt and evolve in response to the changing landscape. These drivers include; technological advancement, market dynamics, globalization, customer expectations, and competitive pressure. First, technological advancement is the primary enabler of modern innovation. Emerging technologies such as AI, blockchain, IoT, cloud computing, and 5G, have created new opportunities for automation, personalization, and real-time decision-making (Dwivedi et al., 2023). GenAI, in particular, exemplifies how frontier technologies can redefine the boundaries of ideation and production by enabling machines to perform creative and strategic tasks previously limited to humans (Bommasani et al., 2022). Second, market dynamics and increasing customer expectations compel businesses to innovate continuously. Consumers demand faster services, customized products, and seamless digital experiences, pushing organizations to reimagine business models and service delivery mechanisms (Hossain, 2023). In this context, digital platforms and data analytics have empowered firms to anticipate trends, personalize offerings, and co-create value with users. Third, globalization has intensified competition and expanded markets, encouraging firms to innovate to remain relevant and expand their global footprint. Through global value chains and cross-border collaborations, businesses are exposed to new ideas, business practices, and consumer needs (OECD, 2023). Fourth, sustainability pressures and regulatory environments also drive innovation, particularly in areas such as green technologies, circular economy models, and ethical business practices (Schroeder et al., 2022). These challenges require organizations to innovate responsibly while meeting compliance standards and

social expectations. Finally, the rise of open innovation ecosystems has democratized access to knowledge and talent. Companies now collaborate with startups, research institutions, and even customers to accelerate innovation cycles and leverage external expertise (Chesbrough, 2022). These drivers collectively shape the innovation agenda in the digital era, making adaptability, agility, and technology integration essential components of modern business strategies.

Strategic Importance of Innovation in Business

Innovation is not merely a technical or operational function; it is a strategic imperative that directly influences long-term organizational survival, competitiveness, and growth. In an era of digital transformation, innovation determines a firm's power to seize emerging opportunities, respond to disruptive changes, and deliver differentiated value to customers (Lindgren & Taran, 2022). Firms that prioritize innovation tend to outperform peers in profitability, customer satisfaction, and market share (Kaplan et al., 2023). From a strategic standpoint, innovation enables businesses to reposition themselves within their industries or even create entirely new markets. The concept of disruptive innovation proposed by Christensen (2020), illustrates how innovative firms can unseat incumbents by introducing solutions that are simpler, cheaper, or better aligned with emerging customer needs. GenAI technologies—by reducing costs, enhancing productivity, and enabling mass personalization—have the potential to serve as disruptive tools in various sectors.

Furthermore, innovation strengthens organizational resilience, allowing firms to anticipate and navigate economic shocks, technological changes, and evolving consumer behaviors. Companies that foster a culture of innovation are more agile, more adaptive to change, and better equipped to pivot in response to external challenges (Teece et al., 2023). Another critical aspect is strategic differentiation. Through innovation, businesses can develop unique value propositions that distinguish them from competitors. Whether through novel product features, superior customer experiences, or optimized business models, innovation becomes a key source of sustainable competitive advantage (Porter & Heppelmann, 2022). In the context of the digital economy, innovation helps to attract investment, enhance brand reputation, and improve internal efficiencies. With technologies like GenAI, organizations are positioned to scale innovation efforts more effectively and strategically align technological capabilities with business goals. Thus, innovation is no longer optional—it is central to strategic planning, value creation, and organizational success in the 21st century.

The Intersection of GenAI and Business Innovation

The convergence of GenAI and business innovation represents a transformative development in the digital economy. As organizations seek to redefine their strategies, operational models, and customer engagement approaches, GenAI emerges as a powerful enabler of innovation across products, processes, marketing, and organizational structures. By leveraging its capabilities to generate new content, simulate complex scenarios, and support decision-making, GenAI facilitates not only incremental improvements but also radical innovation that can disrupt entire industries (Bommasani et al., 2022., Kaplan et al., 2023).

A prominent intersection of GenAI and business innovation is in product and service development. Generative models such as GPT-4 and DALL·E allow businesses to prototype digital products, design user interfaces, and personalize service offerings at scale. For instance, AI-generated design mockups and personalized chat interfaces reduce development time and improve customer satisfaction by aligning products more closely with individual preferences (OpenAI, 2023). In industries such as retail and fashion, GenAI tools are being used to forecast trends, generate new design ideas, and automate catalog creation, significantly accelerating product innovation cycles (Zhou et al., 2024).

GenAI also transforms business processes, enabling automation of tasks that traditionally require human intelligence. In content-driven industries such as media, education, and marketing, AI tools are used to generate articles, promotional materials, and instructional contents with minimal human intervention (Luccioni & Viviano, 2023). In operations and finance, GenAI supports the creation of reports, budget forecasts, and scenario analyses, contributing to more agile and data-informed decision-making (Dwivedi et al., 2023). These capabilities allow firms to re-engineer workflows for higher efficiency, consistency, and responsiveness. In the domain of marketing innovation, GenAI has revolutionized how companies communicate with consumers. AI models can craft tailored advertisements, write persuasive copy, generate product descriptions, and even create virtual brand influencers. The personalization enabled by GenAI enhances consumer engagement and drives conversion rates, as content can be rapidly adjusted for different audience segments and marketing channels (Kaplan et al., 2023). Tools such as Jasper AI and Copy.ai illustrate how businesses are automating creative writing tasks while maintaining brand voice and coherence.

GenAI also enables organizational innovation in its support for new forms of collaboration and knowledge management. AI-powered platforms assist in internal communication, automate routine documentation,

support brainstorming processes, and help organizations to operate more flexibly, and creatively. For example, AI-generated meeting summaries, ideation tools, and planning assistants improve team productivity and innovation culture (Tegmark et al., 2023). Furthermore, organizations use GenAI to support training and upskilling by delivering customized learning content to employees, based on individual's performance profiles and learning needs (Liu & Sundararajan, 2024).

Across sectors, GenAI is able to analyze vast data, learn from context, generate original outputs, and functions as a strategic co-creator, not just a productivity tool. This role is especially critical in environments where innovation requires continuous ideation, iteration, and adaptation. For instance, in the pharmaceutical industry, GenAI accelerates drug discovery by simulating molecular structures and identifying promising candidates for development, thereby shortening time-to-market and reducing research costs (Zhang et al., 2023).

Despite its benefits, the adoption of GenAI for business innovation is not without challenges. Issues related to data security, model bias, and ethical use raise concerns about reliability, accountability, and trust. Therefore, integrating GenAI into innovation strategies requires not only technical readiness but also governance frameworks that align with regulatory standards and organizational values (Luccioni & Viviano, 2023). GenAI represents a paradigm shift in how businesses conceive, develop, and deliver innovation. Its capacity to generate new ideas, automate knowledge work, and enhance customer-centricity aligns directly with the strategic objectives of modern enterprises. As businesses continue to explore and refine their digital transformation agendas, GenAI will increasingly serve as a cornerstone of innovation across industries and functions.

Strategic Advantages of GenAI in Business Innovation

GenAI offers a range of strategic advantages that are reshaping how businesses create value, operate, and compete in a rapidly evolving digital economy. Its capabilities extend beyond task automation to creative generation, personalization, and strategic decision-making, enabling organizations to pursue innovation with greater speed, accuracy, and scale (Kaplan et al., 2023). This section examines the key advantages GenAI brings to business operations, including enhanced speed and efficiency, scalability, cost savings, and data-driven decision-making. Harjika and Kamuinho (2025) found that GAI can be "leveraged to drive innovation and gain a competitive advantage by personalizing customer experiences and optimizing resource allocation in the Canadian industrial sectors of

healthcare and telecommunications]". According to Aagaard and Tucci (2024, pp297), "AI and Industry 4.0 have engendered a strategic shift towards data-driven, customer-centric, and flexible business practices by giving way a new era of competitive advantage and innovation. They are reshaping business model innovation, and redefining the market landscapes (Pearlson et al., 2024) by introducing advanced strategies such as "Bolt-On" AI systems that enhance existing CRM or ERP frameworks, and enabling real-time data analysis and insights". "GenAI has created new content frontiers for business development, facilitated hyper-personalization and instant customization and alignment of products and services to customers'. Moreover, Industry 4.0 introduces servitization and autonomous IoT services, such as Kespri drones for insurance inspections, transforming traditional business models into agile, responsive, and technologically integrated frameworks"

One significant strategic benefit of GenAI is the ability to increase speed and efficiency in executing both routine and complex tasks. Generative models, such as GPT-4 or Google Gemini, can rapidly draft documents, generate marketing content, design product prototypes, or simulate customer interactions-tasks that traditionally take significant time and human resources (Dwivedi et al., 2023). In content-heavy industries such as media, publishing, and advertising, this translates to faster campaign deployment, quicker revisions, and shorter production cycles (Luccioni & Viviano, 2023). Additionally, internal processes such as report generation, proposal writing, and email responses are now being accelerated through AI-driven tools, reducing workflow bottlenecks.

Another major advantage is scalability. GenAI enables businesses to scale content creation, customer service, and product innovation across geographies and demographics without proportional increases in human labor. For instance, AI chatbots can manage thousands of customer queries in multiple languages simultaneously, ensuring consistent service delivery around the clock (Zhou et al., 2024). Similarly, generative design tools allow businesses to launch multiple variations of product designs or advertisements tailored for different markets, enhancing global responsiveness and local relevance. Cost reduction is a compelling motivator for many enterprises adopting GenAI. By automating creative and analytical tasks, companies can reduce reliance on specialized labor, cut development costs, and streamline operations. For example, GenAI in the fashion and e-commerce sectors has lowered design and merchandising expenses by producing virtual samples and automated catalog entries (Zhang et al., 2023). In customer support, AI reduces the cost per

interaction while improving speed and quality, enabling organizations to reinvest resources into higher-value activities.

Furthermore, GenAI enhances data-driven decision-making by generating actionable insights from unstructured and structured data sources. AI models can synthesize large datasets, identify patterns, and propose solutions in natural language, enabling faster and more informed decisions across departments. In finance, for example, GenAI assists in predictive modeling, fraud detection, and automated financial reporting, helping decision-makers respond to market shifts in real-time (Liu & Sundararajan, 2024). In product development, AI-generated simulations and customer feedback analysis provide early validation, reducing risks associated with innovation. Collectively, these strategic advantages position GenAI not merely as a technological upgrade, but also as a transformative business capability. It allows firms to experiment with new ideas, iterate faster, reduce time-to-market, and maintain a competitive edge in fast-changing environments. As businesses seek to navigate increasing complexity and customer expectations, those that successfully integrate GenAI into their innovation strategy are likely to realize significant strategic gains.

Ethical, Legal, and Managerial Considerations of Gen AI

As GenAI becomes increasingly embedded in business operations, it raises a series of ethical, legal, and managerial concerns that must be tackled to ensure responsible and sustainable adoption. While Gen AI models offer transformative potentials, the misuse and unethical use of GenAI introduces complex risks concerning data privacy, algorithmic bias, intellectual property rights, workforce implications, and regulatory compliance. Organizations must adopt a holistic approach that integrates ethical governance and risk management frameworks alongside technical implementation (Floridi & Chiriatti, 2020).

One of the foremost concerns is data privacy and security. GenAI models trained on vast datasets often scraped from public and proprietary sources. When these datasets include sensitive or personally identifiable information (PII), there is the risk of inadvertently generating outputs that compromise privacy or expose confidential data (Luccioni et al., 2023). Furthermore, adversarial actors may exploit generative models to produce misleading or harmful content, thereby creating new cybersecurity challenges. Business leaders must ensure that the data used for training and fine-tuning generative models comply with data protection regulations such as the General Data Protection Regulation (GDPR) and similar local frameworks (Crawford et al., 2023).

Another major ethical concern is algorithmic bias and fairness. Generative models often reflect the biases present in their training data, leading to outputs that can reinforce stereotypes, marginalize certain groups, or produce discriminatory results. For instance, AI-generated content may exhibit gender, racial, or cultural bias, which can damage brand reputation and alienate customers (Binns, 2023). Organizations must invest in model auditing, diverse training datasets, and inclusive design practices to promote fairness and accountability to mitigate these risks.

Intellectual property (IP) and content ownership represent additional legal grey areas. Since GenAI can produce text, images, music, and other creative works, questions arise regarding the originality, authorship, and ownership of such outputs. Legal systems in many jurisdictions are still evolving in response to these challenges. For example, there is debate whether AI-generated content can be copyrighted, and if so, whether the creator of the model, the user, or the AI system itself, holds the rights (Gervais, 2023). Therefore, businesses using GenAI must exercise caution to avoid plagiarism or unauthorized replication of existing works, and they should develop clear internal policies regarding content usage and attribution. Workforce displacement and role transformation also warrant close managerial attention. While GenAI can augment productivity, it also threatens to disrupt traditional job roles, particularly in creative industries, customer service, and administrative functions. Automation of these tasks may lead to job losses or significant shifts in required skill sets (Kaplan et al., 2023). Responsible implementation should prioritize human-AI collaboration, reskilling programs, and the creation of new roles that leverage AI capabilities rather than replace human workers.

Finally, the regulatory landscape for GenAI is still emerging but evolving rapidly. Governments and international regulatory bodies are drafting policies to address transparency, accountability, explainability, and safety in AI development and deployment. For instance, the European Union (EU) AI Acts seeks to classify and regulate AI systems based on risk categories, while other jurisdictions are exploring AI ethics boards, compliance audits, and labeling systems (Butcher & Beridze, 2023). Businesses must stay abreast of regulatory developments and incorporate legal risk assessments into their AI strategy. While GenAI holds vast potentials for innovation, businesses must navigate a complex web of ethical, legal, and managerial issues. Proactive governance, transparency, and ethical foresight are essential to ensure that GenAI contributes positively to business and society.

Challenges and Limitations of GenAIs

Despite its transformative potentials, the integration of GenAI in business innovation is faced with many challenges and limitations that organizations must carefully consider. These challenges span across technical, organizational, and socio-ethical dimensions, and significantly impact the reliability, sustainability, and inclusiveness of AI-driven innovation strategies. One of the most pressing concerns is the quality and reliability of GenAI outputs. While models such as GPT-4 and DALL·E can produce remarkably human-like content, they are not immune to generating inaccurate, misleading, or nonsensical results (OpenAI, 2023). This phenomenon commonly referred to as AI hallucination can undermine businesses' credibility, especially when used in customer-facing roles or content creation. Therefore, ensuring the factual consistency and context-appropriateness of generative outputs remains a significant technical hurdle (Ji et al., 2023). For instance, Deep fakes have numerous such as causing job losses, destroying reputation, image and trust of persons, professionals and corporations, biasing and manipulation of public opinion and market competition, and creation of false information (Marcus, 2022). The inundation of website like Stark overflow with incorrect codes can serious harm developers' productivity, professionalism and reputation. These risks call for more digital responsibility to address them (Lobschat et al., 2021).

Another major limitation lies in the dependence on vast and high-quality datasets. Generative models require extensive training on diverse and representative datasets to perform effectively. However, acquiring, cleaning, and labeling such datasets could be expensive and time-consuming. Additionally, models trained on biased or skewed data are likely to reproduce those biases, raising concerns about fairness and inclusivity (Bommasani et al., 2021). This reliance on data quality and quantity also makes smaller firms and startups less competitive in leveraging GenAI due to limited access to such resources. The challenge of human-AI collaboration also presents significant complexity. While GenAI can enhance productivity, it cannot fully replace human intuition, context-awareness, and ethical judgment. Overreliance on automated tools may erode human creativity and critical thinking, especially in fields like journalism, law, and education (Shin et al., 2023). Organizations must therefore strike a balance by positioning GenAI as a collaborative assistant rather than a substitute for human expertise.

Technical barriers related to infrastructure, energy consumption, and model interpretability also limit the widespread adoption of GenAI. Training and deploying large-scale generative models is computationally intensive, requiring advanced hardware (e.g., GPUs, TPUs), cloud infrastructure, and high energy usage.

These requirements not only increase operational costs but also raise concerns about environmental sustainability (Patterson et al., 2022). Moreover, many generative models function as "black boxes," as the decision-making processes are not easily explainable, which pose risks in regulated industries such as finance and healthcare. Lastly, skills and talent shortages in AI development, deployment, and governance continue to hinder organizational readiness to adopting GenAI. There is a growing demand for professionals with expertise in data science, machine learning, and AI ethics, but the talent pool remains limited. Without the right human capital, organizations may struggle to effectively implement, supervise, and scale GenAI initiatives (McKinsey & Company, 2023).

Ferraro et al., (2024) have argued that Gen AI presents six paradoxes which include "(1) connected yet isolated, (2) lower cost yet higher prices (3) higher quality yet less empathy, (4).satisfied yet dissatisfied, (5).personalized yet introversive, and (6) powerful yet vulnerable". Also, GenAI may be biased against certain groups and individuals based on trained data and if there is no ethical control (Akter et al., 2021), thereby benefitting some stakeholders at the expense of others. To avoid this occurrence, firms should set up an AI ethics board to evaluate the trained data and algorithms (Fosso Wamba & Queiroz, 2021). While GenAI holds promise for driving business innovation, its adoption is not without significant hurdles. Addressing these limitations requires a proactive and multidisciplinary approach-combining technological refinement, ethical oversight, capacity building, and strategic foresight to ensure that the integration of GenAI into business processes is both effective and responsible.

The Future of GenAI in Business Innovation

The future of GenAI in business innovation is marked by increasing sophistication, broader accessibility, and deeper integration into core business strategies. As the technology continues to evolve, it is expected to play a transformative role not only in operational efficiency but also in reshaping business models, consumer engagement, and value creation. One significant trend shaping the future is the rise of multimodal GenAI systems, which combine text, images, audio, and video to produce rich, context-aware content. Tools like OpenAI's GPT-4o and Google's Gemini illustrate how AI is moving beyond single modalities to support more immersive and interactive applications (OpenAI, 2024; Google DeepMind, 2024). These developments are particularly relevant for sectors like marketing, entertainment, healthcare, and education, where complex content and human-like interactions are crucial for engagement and personalization.

Another key development is the emergence of autonomous agents powered by GenAI. These agents

are capable of performing complex tasks independently—such as executing customer support, managing inventories, or conducting financial analysis—while continuously learning from data and adapting to changing business environments (Park et al., 2023). Such capabilities could fundamentally shift how businesses operate, moving from human-centric task execution to AI-led decision-making and service delivery. From a strategic standpoint, GenAI is expected to drive business model innovation, particularly in areas such as on-demand content creation, AI-as-a-Service (AIaaS), and hyper-personalized product design. For example, businesses can offer custom-generated digital goods (like personalized music or art), AI-enhanced consulting services, or automated R&D prototyping. This evolution positions GenAI as a catalyst for new forms of entrepreneurship and enterprise, especially among digitally native firms and startups (Bughin et al., 2023). To fully leverage these opportunities, however, businesses must adopt a proactive and ethical approach to implementation. Key recommendations include: (1) Investing in AI literacy and talent development: Organizations must build internal capabilities through upskilling and reskilling programs, ensuring teams understand the strengths and limitations of GenAI tools (World Economic Forum, 2023), (2) Aligning AI strategies with business goals: Companies should integrate GenAI initiatives within their broader innovation agendas, with clear KPIs and governance structures to track impact and mitigate risks, and (3) Fostering ethical and inclusive AI ecosystems: Transparency, accountability, and fairness must be embedded in AI development pipelines, especially in light of concerns around misinformation, bias, and content ownership (Floridi, 2023).

Governments and regulatory bodies should play a more active role to shape the trajectory of GenAI adoption through legislation, standards, and international cooperation. The EU AI Act, and similar frameworks in the United States and Asia reflect growing efforts to ensure that AI is used responsibly, and in line with societal values (European Commission, 2024). In essence, the future of GenAI in business innovation will be shaped not only by technological progress but also by how businesses, regulators, and societies collectively navigate the associated opportunities and challenges. Companies and organizations that can responsibly harness GenAI stand to gain competitive advantages, while contributing to a more innovative, equitable, and sustainable business landscapes.

Aagaard, A., & Tucci, C. (2024). AI-Driven Business Model Innovation: Pioneering New Frontiers

Conclusion

GenAI models have emerged as transformative tools in the landscape of business innovation. Unlike traditional AI systems, these models do not simply analyze or automate, they create, enabling businesses to explore new frontiers in product development, service delivery, marketing, customer engagement, and decision-making. As explored throughout this paper, the convergence of GenAI and business innovation is fostering not only efficiency and scalability but also novel business models and markets. The conceptual overview of GenAI provided insights into its foundational technologies, including large language models, neural networks, and diffusion systems, which collectively underpin tools like ChatGPT, Gemini, and DALL-E. These technologies empower organizations to automate creative processes and enhance customer experiences in ways that were previously unattainable. Meanwhile, the understanding of business innovation highlighted the diverse types—incremental, disruptive, open, and radical, and showed how digital transformation is now deeply tied to AI capabilities.

At the intersection of the two concepts, GenAI is being deployed across industries to generate business value: from AI-powered design in fashion and product manufacturing to intelligent chatbots in customer support, and from automated medical reporting in healthcare to personalized recommendation engines in retail. These applications illustrate the broad and accelerating influence of GenAI on modern enterprises. Nevertheless, this innovation does not come without challenges. The ethical, legal, and managerial concerns such as; data privacy, algorithmic bias, intellectual property rights, and workforce disruption must be proactively managed. Moreover, businesses must overcome technical limitations and maintain human oversight to ensure quality, fairness, and accountability in AI-generated outputs. Looking to the future, trends such as multimodal AI, autonomous agents, and real-time AI integration will likely redefine how businesses operate, create value, and compete. Firms must invest in AI literacy, align AI initiatives with strategic goals, and embrace ethical principles and regulatory compliance to remain relevant, and responsible in this evolving environment. In sum, GenAI is not merely a technological upgrade; it is a fundamental shift in how innovation is conceived and executed in the business world. Organizations which can successfully integrate these technologies while maintaining ethical and strategic clarity will be best positioned to thrive in the era of AI-driven innovation.

University of Benin

Publication Date: 2025/11/28

Abstract

The study empirically examined the relationship between conflict management styles and performance of secondary schools in South-South geographical zone of Nigeria from the viewpoint of teachers. The conflict management styles examined include avoiding, accommodating, competing, compromising and collaborating conflict management styles. Cross-sectional survey research design was adopted for this study. The population of the study comprises all the teachers in secondary schools in the South-South Geographical Zone of Nigeria. 384 teachers were randomly selected in the different states and copies of questionnaire administered to them. Out of the 385 copies of questionnaire administered to teachers of the selected secondary schools, 345 copies were completed and used for data analyses. The data were analysed using descriptive and inferential statistics using Statistical Package for the Social Sciences (SPSS version 24) software. All hypotheses were tested at 5% level of significance. The finding revealed that avoiding, accommodating, compromising and collaborating conflict management styles significantly impact secondary school performance in South-South Nigeria. However, there is no significant relationship between competing conflict management style and performance of secondary schools in South-South Nigeria. The study recommends that schools should invest in teacher training and professional development programmes to provide them with effective conflict management skills. This could include conflict resolution workshops, seminars, and courses that emphasize teamwork and constructive communication.

Keywords: Conflict management, Performance, Secondary school, South-South zone, Teachers.

Introduction

Secondary schools play a fundamental role in shaping individuals by providing formal education, imparting essential knowledge and skills, and fostering socio-economic advancement (Abulencia, 2021; Okeke-James, Igboke, Anyanwu, & Obineme, 2020). However, concerns about the declining quality of secondary education in Nigeria have been widely documented (Okeke, Adepoju, & Adetarami, 2024). Reports indicate that many secondary school graduates struggle with basic literacy skills, particularly in writing and effective communication, which significantly affects their academic and professional prospects.

Several factors have been identified as contributors to the deterioration of secondary school education in Nigeria. Among these are inadequate physical infrastructure, insufficient learning resources, low teacher motivation, insecurity, and a generally hostile school environment (Obeze, 2023). Another critical but often overlooked factor is ineffective conflict management within schools, particularly among administrators. Poorly managed conflicts disrupt the

learning environment, lower teacher morale, and hinder student academic progress (Obizue, Chukwudebelu, & Onuoha, 2020). These conflicts may arise among students, between students and teachers, among teachers, between teachers and school administrators, and even between educators and parents. If left unresolved, they create a negative school climate that discourages teacher engagement and contributes to declining student enrollment, as parents may perceive such schools as unstable or unfit for learning (Maxwell & Deo, 2024; Dike, 2020; Abdulazeze, 2022).

While numerous studies have assessed the relationship between conflict management and organisational performance, most have focused on industries such as oil and gas industry Achi & Ezekiel-Hart, (2024), ICT industry Rudziah (2024), manufacturing (Oluwasegun and Adebayo (2014), and healthcare Kuazaqui, (2023); Binyanya, (2021), banking industry Agajelu (2024). The educational sector, particularly secondary schools in Nigeria, has received comparatively little attention in this regard. Given the persistent challenges facing the sector, an

in-depth investigation into the role of conflict management in school performance is essential. This study aims to assess the impact of different conflict management styles, avoiding, accommodating, competing, compromising, and collaborating on the performance of secondary schools in Nigeria's South-South geopolitical zone. By understanding the effectiveness of these strategies, the study seeks to provide empirical evidence on how conflict resolution can enhance the overall quality of education and foster a more conducive learning environment.

LITERATURE REVIEW

Nature and Types of Conflict in Secondary Schools

Conflict is an inevitable feature of organisations, resulting from the clash of incompatible goals, interests or values between individuals or groups. It is a social process that arises due to the diversity of organisational members, who have distinct backgrounds, perspectives, and communication styles (Ikemefuna, Kibikiwa, & Zoakah, 2023). Consequently, conflicts are bound to occur within secondary schools and other organisations. To effectively address these conflicts, it becomes essential to comprehend their nature and underlying causes. This understanding helps in creating strategies and interventions that can promote positive resolution and foster a harmonious and productive organisational environment (Egerová & Rotenbornová, 2021).

School conflict can be depicted as a discord between individuals or groups within the school community, arising from differences in ideas, interests, principles, and values (Valente, Afonso, & Németh, 2022). Even though the parties involved may feel excluded, it is important to note that their interests may not actually be excluded (Omodan & Skosana, 2023; Parashar, & Sarma, 2020). The most common conflicts in schools tend to occur between students, as well as between students and teachers (Onyinyechi & Wichendu, 2021). These conflicts can be classified based on their causes and the parties involved. According to Valente (2022), conflicts among teachers typically stem from various factors such as inadequate communication, personal interests, past conflicts, power dynamics, or differences in political and ideological beliefs. Further research also suggests that the majority of conflicts arise from basic miscommunication, misunderstandings, unintended interpretations, inconsequential differences, ineffective decision-making, ambiguous roles and responsibilities, unrealistic expectations, varying standards, and changing economic circumstances (Omodan & Skosana, 2023; Jones, 2021; Adewuyi, Salami, & Dogara, 2021).

Onolemhemhen and Akpede (2022) have identified some noteworthy factors that contribute to conflict in the Nigerian secondary education system. Principals' administrative ineptitude, the theft and misuse of

school funds, staff and student indiscipline, personality issues, role conflicts, and the influence of youthful exuberance are a few of these. In addition, conflicts between students can arise from misunderstandings, physical altercations, group rivalries, instances of discrimination, and incidents of bullying. These factors contribute to the overall conflict landscape in Nigerian secondary schools. Disputes between parents, teachers, and administrators can arise from incidents involving students or conflicts between teachers. These conflicts can be triggered by issues such as the loss of educational materials, problems in the school cafeteria or similar areas, teacher shortages, inadequate pedagogical support from teachers, assessment criteria and decisions, as well as failure to fulfill administrative and bureaucratic requirements set by the management. (Oloore, 2023).

Conflict Management Styles

Conflict management is the act of diagnosing and dealing with conflicts that occur within a company or between people or groups (Zakiah, 2023). It involves understanding the conflict, finding out the reasons behind it, and creating plans to resolve the issues and achieve a solution that benefits everyone involved. Reducing conflict's detrimental impacts is the aim of conflict management as well as to encourage positive results, such as better communication, increased teamwork, and stronger connections (Ronquillo, Ellis, & Toney-Butler, 2023).

Avoiding conflict management style: This is characterised by individuals or organisations choosing to ignore or avoid conflicts rather than addressing them directly (Hocker, Berry, & Wilmot, 2021). In other words, it involves evading confrontation, suppressing emotions, and maintaining a superficial harmony. This approach frequently results in withdrawal since the person utilizing it is unable to address both his or her own problems as well as the worries of the other party (Maiti & Choi, 2021). This approach is frequently taken when engaging the opposing side seems to have more negative consequences than beneficial effects (Filsecker et al., 2020). While avoiding conflicts may seem like a convenient approach in the short term, it can have detrimental effects on individuals and organisations in the long run (Adilo, 2019). One of the main drawbacks of this style is that it does not address the underlying issues causing the conflict. By avoiding conflicts, the root causes remain unresolved, leading to a build-up of tension and potential escalation of the conflict later on. This can result in increased animosity, decreased trust, and a toxic work or school environment (Ronquillo et al, 2023).

Accommodating conflict management style: This style has to do with a low assertiveness coupled with a higher degree of cooperativeness (Binyanya, 2021). The accommodating conflict management style is characterised by individuals or organisations giving precedence to the needs and concerns of others over

their own. It involves a willingness to collaborate, cooperate, and find common ground in order to maintain relationships and harmony (Hocker, Berry, & Wilmot, 2021). One of the main advantages of this style is that it promotes goodwill and fosters positive relationships (Anyakie, 2018). By accommodating the needs and concerns of others, individuals or organisations demonstrate empathy, understanding, and a willingness to compromise (Maore, Mmbwanga, & Were, 2021). This helps to build trust, strengthen relationships, and create an accommodating and harmonious environment. In the context of secondary schools, accommodating conflict management style can promote a positive school climate and culture, enhancing overall performance. While accommodating conflicts may seem like a selfless approach, it can have both positive and negative implications. When individuals consistently prioritize the needs of others over their own, their own concerns and interests may be neglected. This can result in feelings of frustration, resentment, and a lack of personal fulfilment.

Collaborating conflict management style: The style is characterised by employees or organisations working together to find mutually beneficial solutions to conflicts (Tabassum, 2020). It involves active participation, open communication, and a willingness to understand and integrate different perspectives. The collaborating style is often considered the most constructive and effective approach to conflict resolution (Yusuf, Musa, & Abubakar, 2024). One advantage of this style is that it encourages creativity and innovation (Hocker, et al, 2021). By synthesising diverse viewpoints and ideas, individuals can tap into a broader range of possibilities and develop more comprehensive solutions.

Competing conflict management style: The style is also known as the assertive or aggressive style, and it is considered a high concern for personal goals and a low concern for the goals and needs of others involved in the conflict (Maiti, & Choi, 2021). The style is often associated with a win-lose mentality, where one group seeks to dominate and attain their desired outcome at the expense of others. In the context of secondary schools, the competing style can be detrimental to the overall educational environment due to the fact that it can create power struggles among staff members, hinder cooperation between teachers and students, and impede the development of a positive and supportive learning environment. To effectively manage conflicts using the competing style, it is important to consider the long-term consequences and seek opportunities for compromise or collaboration whenever possible. It may also be helpful to engage in active listening, empathy, and assertive communication to ensure that all groups feel heard and understood (Yusuf et al, 2024).

Compromising conflict management style: This strategy is often used when confronting the opposition seems to have more unfavourable results than favourable ones (Parashar & Sarma, 2020; Onyinyechi, & Wichendu, 2021). This style involves seeking a solution that partly satisfies the needs and goals of all parties involved in the conflict. It requires a willingness to sacrifice some of one's own desires in order to reach a mutually acceptable agreement. The compromising style can be beneficial in situations where maintaining relationships and finding a middle ground are important. It allows for a fair distribution of resources, promotes cooperation, and helps to prevent the escalation of conflicts (Maiti & Choi, 2021), and it is particularly useful when time constraints or external pressures necessitate a quick resolution.

Concept of School Performance

Performance in these secondary schools context refers to the measurement and evaluation of how well these educational institutions are achieving their goals and objectives (Ahmed, & Tariq, 2020). It encompasses various aspects, including student enrolment, staff turnover, leadership effectiveness, school climate, and stakeholder satisfaction.

School enrolment: This refers to the total number of students registered in a secondary school. It is an important proxy for measuring the performance of secondary schools as it indicates the level of demand and popularity of the school among students and parents (Ihugba & Okoroafor, 2024). Conflict management styles can impact school enrolment by influencing the school's reputation and perceived quality of education. Schools that effectively manage conflicts, such as by promoting open communication and resolving issues promptly, are more likely to attract and retain students.

Employee turnover: This denotes the rate at which employees exit an organisation and are replaced by new hires (Chukwu, Uzochukwu, & Adanso, 2024). High turnover can be detrimental to a teacher's performance as it disrupts continuity, affects staff morale, and increases recruitment and training costs. Conflict management styles play a significant role in employee turnover because schools that adopt collaborative and cooperative conflict management styles, for example mediation and problem-solving, are more likely to create a positive work environment, reduce conflicts, and retain talented staff.

Staff satisfaction: This measures the level of contentment and fulfilment among the school's employees (Omoz-Oarhe, Yusuf, & Shuaibu, 2022). It is an essential proxy for school performance as satisfied staff members tend to be motivated, productive, and engaged in their work. Conflict management styles can impact staff satisfaction by promoting a wholesome and supportive work environment. Schools that encourage open communication, respect diverse perspectives, and provide opportunities for staff to resolve conflicts

constructively are more likely to have higher levels of staff satisfaction.

Leadership effectiveness: The concept refers to the ability of school managers to guide, inspire, and lead the school community towards achieving its goals (Opatunde, & Oredein, 2023). Effective leadership is vital for the overall performance of a secondary school. Conflict management styles influence leadership effectiveness by shaping the leader's approach to handling conflicts. Leaders who adopt a collaborative and inclusive conflict management style, such as involving stakeholders in decision-making and seeking win-win solutions, are more likely to gain trust, build resilient relationships, and effectively lead the school community.

School climate/culture: It refers to the overall atmosphere, values, and norms within an institution (Yusuf & Amzat, 2020). It encompasses factors such as the level of trust, communication, respect, and shared purpose among students, staff, and parents. A positive school climate/culture is associated with improved academic performance, student engagement, and overall well-being (Wuletu, Hussein, & Bareke, 2024). Conflict management styles significantly impact school climate/culture. Schools that prioritize constructive conflict resolution, promote empathy and understanding, and foster a sense of belonging are more likely to cultivate a positive and inclusive school climate/culture.

Theoretical Review

This study is built on the social exchange theory propounded by the sociologist George C. Homans in 1958. The theory is based on five assumptions. First, rationality, which implies that individuals are assumed to be rational in their behaviour and actions. Secondly, self-interest, which implies that people are inspired by self-interest and seek to boost their rewards while minimising their costs. Thirdly, interdependence, which implies that individuals rely on each other to achieve their goals. Fourthly, comparison level, which means that individuals have a comparison level, which is a standard against which they evaluate the outcomes of their relationships. This idea holds that people interact with others and form connections when they believe the advantages outweigh the disadvantages. In social relationships, the idea highlights the significance of reciprocity, trust, and mutual dependency.

Any conflict management styles that prioritize constructive and collaborative approaches, such as problem-solving or compromise, can contribute to positive social exchanges between stakeholders in secondary schools. When conflicts are managed effectively, it enhances trust, cooperation, and reciprocity among students, teachers, administrators, and parents. This positive social exchange can lead a sense of mutual support, ultimately enhancing schools' performance. On the other hand, conflict management styles that are destructive or avoidant,

such as competition or withdrawal, can lead to negative social exchanges and strained relationships among stakeholders. This can result in decreased trust, increased animosity, and a lack of cooperation, which can hinder organisational performance in secondary schools.

Methodology

The study utilised the cross-sectional survey research. This is because the data needed on variables were collected from the sampled respondents at a specific point in time using questionnaire. Cross-sectional investigations are relatively cheap and prone to minimal bias (Wang & Cheng, 2020). The time horizon for collecting data on the variables of interest from the sampled respondents ranged from July to September, 2024.

355 and 384 principals and teachers

The population of the study comprised all the 3087 secondary schools in the South-South Geographical Zone of Nigeria. The zone is made up of six states, namely, Akwa-Ibom, Bayelsa, Cross River, Delta, Edo, and Rivers states. The population is gotten from the Ministry of Basic and Secondary Education of the states that constitute the South-South zone. Out of the 739 copies of questionnaire administered to principals and teachers of the selected secondary schools, 665 copies were validly completed and utilised for data analyses.

The sampling method adopted for this study is a blend of simple random sampling and stratified sampling, involving the division of the population into homogeneous subgroups and random selection of samples from each stratum. Using both stratified and simple random sampling techniques jointly provides increased precision, enhanced representation, efficient resource allocation, flexibility in analysis, and increased generalizability. In this case, the strata were federal government colleges, state government secondary schools, and privately secondary schools. By ensuring representations, stratified sampling helps to capture the diversity and variations within the population. It assisted in obtaining a sample that accurately reflects the characteristics and the diversity of the population, hence enhancing the generalisability of the finding of the study.

The study employed structured survey questionnaire as data pooling instrument. The instrument items were drawn from extant studies. The questionnaire was partitioned into three sections. Section A amassed data on demographic variables, such as age, gender, education level, marital status, and years of experience. Section B gathered data about the different conflict management styles, namely avoiding, accommodating, competing, compromising, and collaborating. Section C obtained information on the dependent variables, namely School performance. A structured questionnaire developed by Rahim and Magner (1995) was adopted and used to collect information on the independent variables. The instrument comprises 28 items which is cast on a 5-

point Likert scale, varying from Strongly Agree (SA) to Strongly Disagree (SD), (a higher value represents greater use of a conflict style). A structured questionnaire created and validated in conjunction with the project supervisor and experts in the Department of Business Administration, was used to collect data about school performance, the dependent variable. The questionnaire contains 15 items cast on a 5-point Likert scale, varying from Strongly Agree (SA) to Strongly Disagree (SD).

Descriptive statistics was first completed for all the variables of interest. The descriptive analysis was used to determine the teachers and principals' perceptions on the variables of interest while the correlation analysis was used to detect if there is

Table 1: Questionnaire distribution and retrieval

S/N	State	Questionnaire		Response Rate
		Administered	Retrieval	
1	Akwa-Ibom	41	40	97.6
2	Cross-River	82	65	79.3
3	Delta	81	74	91.4
4	Edo	73	73	100.0
5	Rivers	63	59	93.7
6	Bayelsa	44	34	77.3
Total		384	345	89.8

Table 1 shows that 384 copies of the questionnaire were administered to teachers. However, 345 copies were validly filled them. The response rates for the different states are: Akwa-Ibom State (Teachers – 97.6%), Bayelsa State (Teachers – 77.3%), Cross-

auto-correlation among the variables. Multiple regression analysis and independent sample t-test were used to attest relationship among the research variables. All tests were achieved at a 5% level of significance using SPSS software.

RESULTS AND DISCUSSION

Description of respondents' demographic information

This section contains the summary of questionnaire administration and respondents' demographic information such as age, gender, marital status, educational qualification, and working experience . The results are presented in Table 1 below:

Rivers State (Teachers – 79.3%), Delta State (Teachers – 91.4%), Edo State (Teachers – 100%), and Rivers State (Teachers – 93.7%). The overall response rate for teachers is 89.8%.

Table 2: Respondents' demographic information

Demographics	Category	Frequency	Percent
Gender	Male	179	51.9
	Female	166	48.1
	Total	345	100.0
Age	35 & Below	104	30.1
	36 – 45	112	32.5
	46 – 55	111	32.2
	Above 55	18	5.2
	Total	345	100.0
Educational Qualification	NCE & Equivalent	70	20.3
	First Degree	172	49.9
	Postgraduate	103	29.9

Demographics	Category	Frequency	Percent
	Total	345	100.0
Working Experience	1 – 10	104	30.1
	11 – 20	86	24.9
	21 – 30	109	31.6
	Above 30	46	13.3
	Total	345	100.0
Marital Status	Married	154	44.6
	Single	155	44.9
	Widow/er	36	10.4
	Total	345	100.0

Table 2 shows that 179 of the teachers are male which accounts for 51.9% while 166 (48.1%) of the teachers are female. This shows that more male teachers participated in completing the research instrument. Table 2 also shows that for respondents that are teachers, 104 (30.1%) of them are 35 years and below, 112 (32.5%) are between 36 and 45 years old, 111 (32.2%) are between 46 and 55 years old while 18 (5.2%) are above 55 years old. 70 (20.3%) respondents had NCE and its equivalent as their highest qualification. 172 (49.9%) of the respondents had first degree while 103 (29.9%) of the respondents had postgraduate qualifications. From Table 2, majority of the respondents have worked between twenty-one and thirty years which account for 31.6% of the total respondents, while 24.9% have worked for eleven to twenty years. Respondents who

have worked for between one and ten years account for 30.1%. Respondents who have worked for more than thirty years are 46 which amounts to 13.3% of the total respondents. Table 2 shows that 154 of the teachers are married which accounts for 44.6% while 155 (44.9%) of the teachers are single. Only 36 (10.4%) of the respondents are widows or widowers.

Model Estimation and Interpretation

Pearson's correlation coefficient and multivariate regression analyses were used to approximate the relationship between the variables of interests. These statistical tools are used to establish the relationship between the dependent and independent variables and test the stated hypotheses. The results are shown as follows:

Table 3: Pearson's sorrelation coefficient

Variables	SSPERF	AVCM	ACCM	CMPT	CMCM	COLM
SSPERF	1					
AVCM	.434**	1				
ACCM	.332**	.575**	1			
CMPT	-.054	-.072	-.174**	1		
CMCM	.460**	.700**	.655**	-.014	1	
COLM	.512**	.702**	.677**	-.192**	.731**	1

Table 3 displays the Pearson's correlation coefficients for each pair of variables. The Pearson's correlation coefficient (r) should not be greater than 0.80; otherwise, it may be assumed that multi-collinearity exists for independent variables that have a correlation coefficient greater than 0.80 (Bryman & Cramer, 1997). Results in Table 3 showed that none of the variables are higher than 0.80, ruling out the possibility of multi-collinearity in the model.

Table 3 shows that secondary school performance (SSPERF) is positively and significantly related to AVCM [$r = 0.434$, $p < 0.05$], ACCM [$r = 0.332$, $p <$

0.05], CMCM [$r = 0.460$, $p < 0.05$], and COLM [$r = 0.512$, $p < 0.05$]. However, the results show that there negative and non-statistically significant relationship between secondary school performance (SSPERF) and CMPT [$r = -0.054$, $p > 0.05$].

Table 4: Estimated model of the relationship between conflict management styles and secondary school performance

Independent Variables	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Hypothesis Testing
	B	Std. Error	Beta			
(Constant)	2.338	0.161	-	14.568	0.000	
AVCM	0.153	0.054	0.215	2.820	0.005	Reject H ₀₁
ACCM	0.167	0.045	0.296	3.677	0.000	Reject H ₀₂
CMPT	0.002	0.035	0.003	0.069	0.945	Do Not Reject H ₀₃
CMCM	0.099	0.046	0.158	2.163	0.031	Reject H ₀₄
COLM	0.293	0.051	0.473	5.790	0.000	Reject H ₀₅

$R^2 = 0.310$; Adj $R^2 = 0.299$; F-Statistic = 30.400; F-Statistic (Prob) = 0.000; Durbin-Watson = 1.736; Number of Observation = 345

Dependent Variable: School Performance (SSPERF)

Table 4 shows that secondary school performance (SSPERF) is positively and significantly related to AVCM [$\beta = 0.153$, $t = 2.820$, $p = 0.005$], ACCM [$\beta = 0.167$, $t = 3.677$, $p = 0.000$], CMCM [$\beta = 0.099$, $t = 2.163$, $p = 0.031$], and COLM [$\beta = 0.293$, $t = 5.790$, $p = 0.000$]. However, the results show that there is a positive but non-statistically significant relationship between secondary school performance (SSPERF) and CMPT [$\beta = 0.002$, $t = 0.069$, $p = 0.945$]. The R^2 of 0.310 indicates that the independent variables account for 31% of the variations in the dependent variable. The Adjusted R^2 of 0.299 suggests that the independent variables jointly explained 29.9% of the variation in the dependent variable. The Durbin-Watson statistic of 1.736 exposes the absence of first order serial correlation. The F-statistic of 30.4 is significant at $p = 0.000$ inferring that the overall regression model explains a considerable percentage of the variability in the dependent variable.

Discussion of Findings

Firstly, the study found that there is a positive and significant relationship between avoiding conflict management style and performance of schools (secondary) in South-South Nigeria. This finding disagrees with the outcome of the works of Adetunji and Adetunji (2018), Ekechukwu and Ifeanyichukwu

(2021), Kalkan et al (2020), Owan (2018) that showed avoidance conflict management style impact performance. This study reiterates that conflict avoidance in schools can have a negative impact on the overall effectiveness of educational institutions. When disagreements and concerns go unresolved, they tend to persist and fester, disrupting the peaceful learning environment that schools aim to create. Persistent avoidance of conflict can present itself in a variety of ways. It may result in a persistent culture of quiet and avoidance, in which people stop from discussing concerns openly.

Secondly, the study found that there is a significant relationship between accommodating conflict management style and performance of secondary schools in South-South Nigeria. Accommodating conflict management is a management approach that prioritizes relationship maintenance over dispute resolution (Yusuf,Musa, & Abubakar, 2024). This indicates that, in the context of secondary schools in Nigeria, accommodating style entails a proclivity to give in or compromise during confrontations in order to prevent hurting relationships and maintain a pleasant school atmosphere. The discovery of a substantial association between accommodating conflict management style and school achievement shows that

this approach to conflict resolution has major consequences.

Moreover, the study revealed that there is no significant relationship between competing conflict management style and performance of secondary schools in South-South Nigeria. This research outcome is supported by the outcomes of Brandebo (2020), Marshall, Roache and Moody-Marshall, (2020) that found that a substantial dependence on competing conflict management styles in a school setting can have far-reaching effects, particularly in terms of eroding relationships among members of the school community. As observed by Marshall et al. (2020), individual mistrust may arise as a result of the competitive nature of this strategy. In an environment where everyone is looking out for themselves, colleagues and students may become suspicious of one another's motivations thereby weakening the sense of belonging and shared purpose that should ideally define a school community. Furthermore, the study found that compromising conflict management style does significantly impact the performance of secondary schools in South-South Nigeria. The works of Omene, (2021), Soomro, Saraih and Ahmad (2023), Valente and Lourenço (2020) that found that compromise conflict management style that entails finding common ground and establishing agreements via mutual compromises plays a significant role in overall school achievement support the outcome of this study. The compromise strategy places an emphasis on finding common ground, which may lead to constructive problem-solving in schools. When disagreements are resolved by compromise, it is common for both sides to give up something in order to achieve an agreement.

Lastly, there is a significant relationship between collaborating conflict management style and performance of secondary schools in South-South Nigeria. This research outcome is supported by the outcomes of Chandolia and Anastasiou (2020), Ebeguki et al. (2019), Larasati and Raharja (2020) and John-Eke and Akintokunbo (2020) that found that collaboration encourages open conversation, trust, and a sense of togetherness among school stakeholders, including teachers, administrators, students, and parents, and promotes a healthy school culture. When school stakeholders resolve issues collectively, it develops a sense of togetherness and shared responsibility. Collaboration in conflict resolution has the potential to improve teacher-student relationships. When principals include teachers and students in

conflict resolution, trust and mutual respect are fostered (Yusuf, Musa, & Abubakar, 2024; Maxwell & Deo, 2024). Therefore, by incorporating all stakeholders in the conflict resolution process, secondary schools can have access to a greater range of ideas and perspectives that may result in further innovation and growth of teaching approaches, curriculum, and educational procedures as a whole.

CONCLUSION AND RECOMMENDATIONS

Poor understanding of conflict management has had a negative impact on school administration and performance. Due to lack clear-cut strategies for dealing with conflicts, most school administrators relied on trial-and-error approach to resolve them. Conflicts among teachers, between teachers and principals, or even among students have had detrimental effects on the overall functioning and performance of secondary schools in Nigeria. In line with this, this study shed light on the complex link between conflict management styles used within educational institutions and their subsequent influence on school performance. The study investigated conflict management styles in secondary schools in the South-South geographical zone of Nigeria which is made up of six states, namely, Akwa-Ibom, Bayelsa, Cross River, Delta, Edo, and Rivers states. The study concludes that the implementation of appropriate conflict management strategies will remain pivotal in achieving excellence performance in secondary schools in South-South Nigeria.

Based on the findings of this study, the following recommendations are suggested:

- Schools should invest in teacher training and professional development programmes to provide them with effective conflict management skills. This could include conflict resolution workshops, seminars, and courses that emphasize teamwork and constructive communication.
- The non-significant relationship between competing conflict management style and performance of secondary schools in South-South Nigeria suggests that educators and administrators should take a more comprehensive approach to school development. Rather than concentrating on conflict resolution techniques, efforts should be widened to incorporate a broader range of aspects such as curriculum quality, teacher training, parent engagement, and student support networks to improve school performance.

Publication Date: 2025/11/28

Abstract

This study sought to investigate the impact of climate change factors, specifically temperature change, rainfall variability, extreme weather events, and environmental degradation, on the return on equity (ROE) of Nigerian banks. The study employed panel regression analysis on data gathered over a 10-year period, focusing on four key variables: temperature change (TEMP), rainfall variability (RAIN), extreme weather events (EWE), and environmental degradation (ENV). The results revealed significant effects of temperature change, extreme weather events, and environmental degradation on banks' ROE, with temperature change and environmental degradation showing a positive and significant relationship. Rainfall variability, however, did not significantly impact ROE. These findings underscore the critical role of climate change and environmental factors in shaping the financial performance of banks, particularly in economies like Nigeria, where such factors are becoming increasingly prevalent. The study also applied diagnostic tests, including unit root tests, variance inflation factor analysis, and heteroskedasticity tests, to ensure the robustness of the regression results. Based on the findings it was recommended that banks should integrate climate risk into their strategic planning and risk management frameworks to ensure sustainable growth and profitability. Banks should increase their focus on green financing and environmental sustainability initiatives, banks should invest in climate risk assessment tools and data analytics to better understand and manage the financial risks associated with climate change.

Key Words: *Temperature Change, Rainfall Variability, Extreme Weather Events, Environmental Degradation, Banks Return on Equity,*

Introduction

Climate change is a worldwide issue that significantly affects the environment, economies, and human societies at large (Agbloyor, 2021). It describes the gradual rise in global temperatures over time, primarily driven by human-induced actions such as the burning of fossil fuels, deforestation, and alterations in land usage (Agbloyor, 2021). The outcomes of climate change are severe and widespread, manifesting in rising sea levels, more frequent extreme weather events, droughts, heat waves, and reduced water availability. In Nigeria, the effects are also evident in the economic sector, especially in banking, where it is estimated that the country may have experienced up to 11% GDP loss

by 2020 due to climate-related challenges (CBN, 2019). The financial sector, particularly banks, faces rising threats linked to credit, market, and operational risks due to climate variability. Reports by the Nigerian Meteorological Agency (NIMET, 2020) show that the nation's temperature has increased by between 1 and 2 degrees Celsius over recent decades. This temperature rise contributes to frequent and intense climate events like flooding, drought, and extreme heat, which adversely affect agriculture, public infrastructure, and health outcomes (Adejuwon, 2022). Consequently, these environmental shifts are impacting banking operations by raising exposure to climate-related financial disruptions and operational costs.

Recognizing the growing threat, the Central Bank of Nigeria has introduced various measures to foster environmentally responsible banking and reduce the carbon emissions associated with financial sector operations (CBN, 2019).

Climate-related threats such as droughts, floods, and extreme heat events have the potential to damage physical infrastructure, interrupt supply networks, and hinder economic activities, thereby affecting the overall performance of the banking industry. In addition, climate change may trigger shifts in consumer behavior, lead to stricter regulatory expectations, and prompt technological innovations, all of which could influence banks' operational frameworks and their profitability (Deloitte, 2020). The Nigerian banking sector's performance is deeply interconnected with the broader economic environment, and as such, climate-induced disruptions can significantly affect the quality of banks' assets, their liquidity levels, and capital sufficiency (CBN, 2019). Also, climate change poses new challenges to risk management practices, compelling banks to respond to evolving threats including climate-related credit, market, and operational risks. Nigeria's banking industry is also exposed to direct physical climate risks, such as potential harm to banking infrastructure—like branches and ATMs—which may interrupt financial services and undermine public trust. Furthermore, climate change can hinder the sector's capacity to deliver financial services, particularly to at-risk groups such as low-income earners and small-scale farmers, who often bear the brunt of climate-related disruptions (IFAD, 2020).

The performance of Nigeria's banking sector serves as a crucial measure of the overall strength and resilience of the country's financial system, with far-reaching implications for national economic stability (CBN, 2020). Various stakeholders—including financial managers, regulators, and investors—pay close attention to banking performance, given its role in maintaining systemic financial health and influencing broader economic trends (CBN, 2020). For banks in Nigeria to remain viable in the long term, it is important to identify the key factors driving their performance and to implement strategies that enhance these determinants (Podder, 2022). Several elements

have contributed to shifts in banking performance in the country, ranging from macroeconomic dynamics and evolving regulatory frameworks to the influence of technological progress (Adelegan, 2019). To uphold efficiency and support financial system stability, the Central Bank of Nigeria has introduced a range of policies and supervisory measures aimed at ensuring sound banking practices (CBN, 2020). The significance of the banking sector's performance extends beyond institutional interests, given that banks play a fundamental role in promoting investment, facilitating transactions, and advancing economic development (Levine, 2020). However, climate change now presents a growing challenge to banking operations in Nigeria, as it raises exposure to credit, liquidity, and operational risks—factors that may undermine both profitability and systemic stability (CBN, 2019).

Objectives Of The Study

The general objectives of this study are to examine the impact of climate change on Nigeria Banking sector performance. Specific objectives are as follow;

1. To investigate the effect of temperature change on banks return on equity in Nigeria.
2. To examine the impact of rainfall variability on bank return on equity in Nigeria.
3. To analyze the effect of frequency of extreme weather events on return on equity in Nigeria.
4. To examine the effect of Environmental Degradation on banks return on equity in Nigeria :

REVIEW OF RELATED LITERATURE

Concept of Climate Change

Climate change is a complex and interdisciplinary phenomenon that has been thoroughly investigated by researchers from multiple academic fields. According to the Intergovernmental Panel on Climate Change (IPCC, 2023), climate change refers to a long-term and statistically significant shift in climatic patterns. Watson (2022) describes it as changes in the statistical characteristics of the climate system, such as alterations in averages, variability, and the occurrence of extreme weather events. Hulme (2019) views climate change as a concept that is shaped through social interpretation, influenced by cultural, political, and economic contexts. Jasanoff (2020) further asserts that climate change

emerges from the joint influence of natural systems and societal processes, emphasizing the interconnectedness of science, governance, and cultural perspectives. On the other hand, Mann (2023) focuses on the scientific basis of climate change, stressing the role of human activity and greenhouse gas emissions in accelerating global warming. Researchers from varying disciplines continue to explore the multidimensional nature of climate change and its implications.

Schneider and Oppenheimer (2023) have examined the environmental and biological dimensions of climate change, emphasizing its adverse effects on ecosystems and biodiversity. From an economic standpoint, Stern and Nordhaus (2023) have evaluated the financial implications of climate change, weighing the benefits and costs associated with both mitigation and adaptation efforts. Giddens (2019) addressed the sociocultural dynamics of climate change, analyzing how it both influences and is influenced by human societal structures. In the realm of global governance, Bodansky and Rajamani (2022) have focused on the international climate regime and its ability to respond effectively to the climate emergency. The banking industry, in particular, holds a pivotal role in combating climate change by mobilizing financial resources toward renewable energy initiatives, climate-resilient infrastructure, and sustainable agricultural practices. Furthermore, banks can strengthen their response to climate risks by embedding these risks into their risk management systems and offering transparent climate-related financial reporting to relevant stakeholders. Through such measures, banks can play a vital role in lessening the negative effects of climate change and in promoting a shift toward a low-carbon global economy..

The role of the banking sector in addressing climate change extends beyond offering capital for renewable energy and sustainable infrastructure projects. Banks are also well-positioned to influence the adoption of sustainable practices among their clients and broader stakeholder groups. Through advocacy and leadership, banks can contribute to advancing environmental sustainability and responsible development. For instance, they can engage in collective industry efforts focused on establishing principles and frameworks for sustainable finance or participate in policy discussions

to emphasize the importance of environmental stewardship and sustainable economic practices. Moreover, banks have the opportunity to collaborate with a diverse range of actors—including non-governmental organizations, academic institutions, and government bodies—to champion sustainability. Such partnerships may include financing environmentally responsible projects with NGOs, working with academic institutions to develop new sustainable technologies, or supporting governments in formulating and enforcing environmental policies and regulations that encourage sustainable growth (Steffen, 2020)

Temperature Change

Temperature change refers to fluctuations in the Earth's average surface temperature over time. The Intergovernmental Panel on Climate Change (IPCC, 2019) describes it as a statistically meaningful shift in climate indicators across an extended timeframe. Hansen (2019) views it as the difference between present-day temperatures and a baseline average, typically measured over a specific historical period such as the last 100 years. According to Rohde (2020), temperature change can be quantified by the rate at which the global mean surface temperature evolves, often expressed in degrees Celsius per decade. Santer (2020) categorizes temperature changes into "external," which result from influences like solar variability or volcanic activity, and "internal," stemming from factors such as ocean circulation patterns or ice sheet behavior. Marvel (2020) further distinguishes between "fast" temperature shifts, which unfold over years or decades, and "slow" shifts, which occur over centuries or even millennia. These temperature variations carry significant consequences for ecosystems and human populations, with predictions indicating continued warming throughout the 21st century. This trend is expected to increase the frequency and severity of extreme weather events—such as heatwaves, droughts, and storms (Seneviratne, 2021)—and to contribute to rising rates of illness and death due to heat stress, respiratory diseases, and the broader spread of infectious vectors. These outcomes stress the urgency of addressing temperature change, with the banking sector playing a crucial role by financing renewable energy projects, supporting sustainable infrastructure,

and promoting climate-resilient agricultural initiatives (Clark, 2023).

The banking sector holds a vital position in addressing temperature change by channeling financial resources toward environmentally sustainable projects and encouraging responsible practices among its clientele. As noted by the United Nations Environment Programme Finance Initiative (UNEP FI, 2020), banks can contribute to the reduction of greenhouse gas emissions by funding renewable energy ventures, supporting improvements in energy efficiency, and promoting sustainable land use strategies. In addition, banks can influence client behavior by integrating environmental, social, and governance (ESG) criteria into their credit assessments and investment policies. These actions not only aid in mitigating the adverse effects of temperature change but also foster long-term sustainable economic development (Batten, 2018). Moreover, fluctuations in temperature have important consequences for the way banks manage risk. The occurrence of extreme heat and severe weather events can heighten the likelihood of loan defaults, lower the value of secured assets, and interfere with normal business functions (Nguyen, 2020). In response, financial institutions must embed climate-related risks into their overall risk management systems and design effective strategies to cope with them. These strategies may include diversifying lending activities, backing infrastructure projects that are resilient to climate stress, and encouraging sustainability-focused behavior among borrowers (Campiglio, 2018). Such measures can help banks limit their vulnerability to climate-induced risks while contributing to broader efforts aimed at achieving sustainable economic resilience.

Concept of Rainfall variability

Rainfall variability refers to the irregularities in precipitation patterns across both time and geographic locations, encompassing shifts in the intensity, frequency, duration, and spatial distribution of rainfall events. The Intergovernmental Panel on Climate Change (IPCC, 2023) identifies rainfall variability as a fundamental element of climate change, given its wide-ranging effects on ecosystems, biodiversity, and human communities. Nicholson (2023) characterizes it as the

fluctuations in rainfall that occur from year to year and across decades, often influenced by atmospheric circulation, sea surface temperatures, and alterations in land use. In a similar vein, Dai (2023) defines it as the variation in rainfall patterns observed across multiple temporal scales, from intra-seasonal to inter-annual and decadal changes. These fluctuations in rainfall can severely impact agriculture, water resource planning, and human habitation by increasing the frequency and intensity of droughts, floods, and other extreme weather phenomena (Karl et al., 2020). Additionally, rainfall variability is increasingly attributed to global climate change, as many areas around the world are witnessing significant shifts in precipitation patterns due to the rise in global temperatures (Trenberth, 2021).

The origins and outcomes of rainfall variability are intricate and influenced by a diverse range of interacting factors. Trenberth (2021) explains that rainfall fluctuations are shaped by elements such as atmospheric circulation dynamics, variations in sea surface temperatures, and transformations in land usage. Similarly, Dai (2023) identifies major contributors to rainfall variability, including climate phenomena like the El Niño-Southern Oscillation (ENSO), the Pacific Decadal Oscillation (PDO), and the North Atlantic Oscillation (NAO). These shifts in rainfall patterns exert profound effects on both natural ecosystems and human populations, altering vegetation growth, reducing water accessibility, and diminishing agricultural yields. Moreover, rainfall variability has been associated with broader social and economic issues, including population displacement, conflict escalation, and uneven development outcomes (Barrios et al., 2010). The financial sector—particularly banks—plays a pivotal role in addressing these challenges by offering funding for infrastructure that is resilient to climatic shocks, promoting sustainable agricultural practices, and supporting disaster preparedness and risk reduction measures (Clark, 2023). Gaining a thorough understanding of rainfall variability and integrating that knowledge into financial planning and investment strategies is vital for fostering resilient and sustainable communities amidst ongoing climate change.

Frequency of Extreme Weather Events

The frequency of extreme weather events refers to the rising occurrence of intense and uncommon climate phenomena such as heatwaves, droughts, floods, and storms—conditions that are increasingly intensified by ongoing climate change (IPCC, 2019). As noted by Smith (2020), this upward trend is projected to persist as global temperatures continue to rise, posing significant threats to both ecosystems and human populations. Rahmstorf and Coumou (2019) emphasize the strong correlation between climate change and the escalation of extreme weather patterns, predicting a continuation of this trend throughout the 21st century. Nevertheless, scholars like Sun et al. (2020) highlight the complexity of this relationship, pointing out that other contributing factors—including land-use transformations and expanding urbanization—also influence the frequency of such weather anomalies. Research conducted by Zhang and Chen (2022) further reveals that recurring extreme weather conditions have pronounced consequences on public health, such as increased instances of heat-related illnesses, respiratory complications, and the proliferation of disease-carrying vectors. Beyond health, these climate extremes carry substantial economic ramifications, such as infrastructure destruction, diminished labor productivity, and disruptions to agriculture and food supply chains (Easterling, 2020; Hsiang, 2022). Given these wide-ranging impacts, the banking sector has a pivotal responsibility in mitigating the effects of extreme weather by financing climate-resilient infrastructure, supporting sustainable farming systems, and investing in disaster risk reduction initiatives (Clark, 2023).

The involvement of the banking sector in responding to the growing incidence of extreme weather events goes beyond merely financing climate-resilient infrastructure and sustainable agricultural initiatives. Banks are strategically positioned to foster climate-resilient behaviors among their clients and associated stakeholders. One approach is by offering financial incentives, such as reduced interest rates on loans directed toward climate-resilient ventures, or by providing advisory services to support the adoption of environmentally sustainable practices. Moreover, banks can collaborate with external partners—including

governmental agencies, non-governmental organizations (NGOs), and research institutions—to further climate adaptation efforts and reduce disaster risks. These partnerships may take the form of co-developing public infrastructure projects with government bodies, financing resilience-focused programs in marginalized communities with NGOs, or supporting innovation through academic collaborations on climate adaptation technologies. Additionally, the rising frequency of extreme weather events carries important implications for the risk management strategies of banks.

Environmental Degradation

Environmental degradation represents a deeply layered and multifaceted process, encompassing a wide range of ecological harms such as deforestation, habitat loss, water contamination, and soil erosion—most of which are driven by anthropogenic activities including industrial pollution, unsustainable land use, and the broader impacts of climate change. As emphasized by Rockström et al. (2009) and Steffen et al. (2020), such degradation not only undermines biodiversity and disrupts vital ecosystem functions, but also accelerates the pace of global climate instability. Beyond the ecological sphere, environmental degradation has profound economic implications. Stern (2021) highlights that the deterioration of natural systems leads to resource depletion, infrastructure vulnerabilities, and adverse health outcomes—all of which impose significant costs on national economies and public welfare. Kumar (2018) further asserts that this degradation is often exacerbated by systemic drivers such as widespread poverty, income inequality, and patterns of consumption that disregard environmental limits. Moreover, the social dimensions of environmental harm are equally pressing. As noted by Alier (2022), environmental degradation frequently contributes to population displacement, the erosion of cultural heritage, and the deepening of social disparities—particularly in vulnerable communities. Addressing such a complex challenge necessitates a multidimensional strategy that integrates environmental, social, and economic perspectives in line with the guidance provided by the Intergovernmental Panel on Climate Change (IPCC, 2019). Within this context, the

banking sector has an increasingly crucial role to play. Financial institutions can contribute to mitigating environmental degradation by channeling capital into sustainable infrastructure, renewable energy initiatives, and environmentally friendly technologies. As Clark (2023) suggests, banks should embed environmental considerations into their enterprise risk frameworks and enhance transparency through environmental-related financial disclosures. Moreover, banks can serve as catalysts for sustainable development by supporting projects that prioritize biodiversity preservation, sustainable agricultural practices, and eco-tourism ventures. In collaboration with governmental bodies and civil society stakeholders, banks are well-positioned to influence policy formation and regulatory development aimed at safeguarding environmental resources and promoting sustainability, as highlighted by the World Bank (2020).

Theoretical framework

Stakeholder theory

The stakeholder theory, developed by Freeman (1984), posits that organizations have a responsibility to various stakeholders, including shareholders, customers, employees, and the environment. In the context of climate change, banks have a responsibility to manage climate-related risks and opportunities, not only for their own financial sustainability but also for the benefit of their stakeholders (Amaeshi A, 2017). This means that banks must consider the impact of climate change on their customers, employees, and the environment, and develop strategies to mitigate these impacts (Porter & Kramer, 2006). For example, banks can provide financing for climate-resilient infrastructure, offer climate-related insurance products, and develop sustainable investment strategies (Clark, 2023). By doing so, banks can reduce the risks associated with climate change, while also creating opportunities for growth and development. Furthermore, the stakeholder theory suggests that banks have a moral obligation to act in the best interests of their stakeholders, including those who may be impacted by climate change (Donaldson & Preston, 1995). This means that banks must prioritize the needs of their stakeholders, including the environment, and

develop strategies that balance economic, social, and environmental considerations.

The stakeholder theory is particularly relevant to banks, which are highly vulnerable to climate-related risks (Akinlo, 2018). Nigeria is a country with a diverse geography and climate, and is highly dependent on agriculture, which is a sector that is highly vulnerable to climate change (Adejuwon, 2006). As a result, banks must develop strategies to manage climate-related risks, including credit risk, where climate-related events such as droughts, floods, and heatwaves may impact borrowers' ability to repay loans, leading to increased defaults and credit losses. Market risk as it's related to climate-related policies and technological changes may impact the value of banks' investments. The stakeholder theory suggests that banks have a responsibility to manage these risks, not only for their own financial sustainability but also for the benefit of their stakeholders (Amaeshi A, 2017). This means that banks must prioritize the needs of their stakeholders, including farmers, small business owners, and individuals, and develop strategies that balance economic, social, and environmental considerations.

The impact of climate change on banks' return on equity (ROE) can be explained through the lens of stakeholder theory. According to stakeholder theory, banks have a responsibility to manage climate-related risks and opportunities, not only for their own financial sustainability but also for the benefit of their stakeholders. Temperature change, rainfall variability, frequency of extreme weather events, environmental degradation, and drought frequency can all have significant impacts on banks' financial performance, including their ROE. For example, temperature change can lead to increased operating expenses, reduced revenue, and decreased asset values, all of which can negatively impact banks' ROE. Similarly, rainfall variability, frequency of extreme weather events, environmental degradation, and drought frequency can also have significant impacts on banks' financial performance, including their ROE. By prioritizing the needs of their stakeholders and developing strategies that balance economic, social, and environmental considerations, banks can mitigate the negative impacts

of climate change on their ROE and ensure long-term financial sustainability.

Risk Management Theory:

The Risk Management Theory, which was first introduced by Knight (1921), emphasizes the importance of identifying, assessing, and prioritizing risks in business operations. In the context of climate change, this theory suggests that banks must adopt a proactive approach to managing climate-related risks as it's affect banks related risk such as credit risk, market risk, and operational risk (Kumar et al., 2016). By doing so, banks can minimize the potential negative impacts of climate change on their financial performance and ensure long-term sustainability (Campiglio, 2016). Furthermore, the Risk Management Theory highlights the need for banks to develop effective risk management strategies that take into account the interests of all stakeholders, including shareholders, customers, employees, and the environment (Carroll & Buchholtz, 2014).

In the Nigerian banking sector, the application of the Risk Management Theory is crucial for mitigating the impacts of climate change. Given the country's vulnerability to climate-related risks, banks in Nigeria must prioritize the development of effective risk management strategies that address the unique challenges posed by climate change (Akinlo, 2018). This may involve conducting regular climate-related risk assessments, developing climate-resilient financial products, and implementing sustainable banking practices (Ojo, 2019). By adopting a proactive and stakeholder-focused approach to risk management, banks in Nigeria can reduce their exposure to climate-related risks and contribute to the country's sustainable development (Amaeshi & Adi, 2017).

Empirical Review

Akinlo (2018) carried out an empirical investigation into the connection between climate change and the financial outcomes of Nigerian banks. Utilizing panel data from 10 commercial banks covering the period 2005 to 2015, the study established that climate-induced hazards—particularly flooding and drought—exert a considerable influence on the liquidity and profitability levels of these institutions. The findings

indicated that such environmental risks contribute to reductions in key financial metrics such as Return on Equity (ROE) and Return on Assets (ROA), thereby threatening the broader financial health of the sector. Based on these outcomes, Akinlo emphasized the urgency for Nigerian banks to adopt robust climate risk management frameworks to cushion the impact of environmental disruptions on their operational performance.

Ojo (2019) explored the influence of climate variability on the financial performance of Nigeria's banking industry. This study focused specifically on the effects of shifts in temperature, irregular rainfall patterns, and the incidence of extreme weather conditions on banks' ROE. Drawing on time series data from 1990 to 2018, the research applied a Vector Autoregression (VAR) model to evaluate the dynamic interrelationships between climatic variables and financial performance. The analysis showed that rising temperatures and more frequent extreme weather episodes were associated with a significant decline in ROE. Interestingly, variations in rainfall had a marginally positive effect. The study concluded by advocating for the integration of adaptive risk management mechanisms within banks to address climate-related vulnerabilities and sustain long-term financial viability.

Oduntan, Salami, and Adeyemi (2020) conducted a comprehensive study on how climate change influences the financial resilience of banks operating in Nigeria. Drawing on data from 20 leading banks over a 15-year period (2005–2019), the study adopted an integrative methodological framework that combined panel regression, Vector Autoregression (VAR), and impulse response analysis. The primary aim was to explore the dynamic interplay between climate variables—such as changes in temperature and levels of precipitation—and key banking performance metrics, including Return on Equity (ROE), Return on Assets (ROA), and Non-Performing Loans (NPLs). The empirical results showed that fluctuations in temperature were linked to notable declines in ROE, while extreme rainfall conditions were found to be positively associated with an increase in NPLs. The study also revealed that the adverse financial effects of climate change were more

acute among banks with higher risk exposure, particularly those heavily involved in agricultural lending. Additionally, macroeconomic variables like inflation and foreign exchange instability were found to intensify the financial vulnerability of banks facing environmental stressors. These findings underscore the systemic nature of climate-related risks within the Nigerian banking sector. As a result, the authors recommended that banks prioritize the integration of climate risk considerations into their overall strategic planning. This includes improving climate-related disclosures, strengthening internal risk management systems, and making targeted investments in infrastructure and technology that support resilience against environmental threats.

Goldstein and colleagues (2020) investigated how climate change influences the financial outcomes of Japanese banks, focusing on 15 of the country's leading financial institutions over a 19-year period from 2000 to 2019. Utilizing panel regression techniques, the study assessed how shifts in climate-related indicators—specifically temperature and precipitation—affect core financial metrics such as Return on Equity (ROE), Return on Assets (ROA), and Non-Performing Loans (NPLs). The research uncovered that rising temperatures are linked to declining ROE and ROA, indicating a direct negative effect on profitability, while increased precipitation was associated with a rise in NPLs. These effects were most evident in banks with significant exposure to climate-sensitive sectors, suggesting that vulnerability to environmental factors is not evenly distributed across the banking industry. In response to these findings, the authors proposed several recommendations to strengthen climate resilience in the sector. These include formulating and implementing robust climate risk management frameworks, improving transparency through climate-focused disclosures, investing in infrastructure and technologies that can withstand environmental shocks, and strategically diversifying lending portfolios to reduce risk concentration.

RESEARCH METHODOLOGY

Research Design

This study adopts an ex-post facto research design. As noted by Asika (2017), this design is used when the researcher seeks to identify cause-and-effect relationships between variables without manipulating the independent variable. The rationale for using this design lies in the nature of the data—specifically historical time-series and panel data on climate change indicators and bank performance metrics, such as Return on Equity (ROE)—which cannot be controlled or altered by the researcher. Therefore, the ex-post facto design provides a suitable and objective framework for analyzing the causal relationship between climate-related risks and financial outcomes in the banking sector.

Method of Data Collection

The study relies solely on secondary data obtained from reputable and verifiable sources. Financial performance data (ROE) were sourced from the annual financial statements of the selected banks, as well as from the Central Bank of Nigeria (CBN) annual reports and the Nigerian Stock Exchange (NSE). Climate-related data—including average temperature, rainfall volume, incidence of extreme weather events, drought frequency, and indicators of environmental degradation—were obtained from the Nigerian Meteorological Agency (NiMet), the World Bank Climate Data Portal, and the National Environmental Standards and Regulations Enforcement Agency (NESREA).

Method of Data Analysis

To examine the relationship between climate change indicators and the return on equity of Nigerian banks, the study applies panel regression analysis. Both fixed effects and random effects models are estimated, and the Hausman specification test is used to determine the more appropriate model for the analysis. All statistical estimations and diagnostic tests are conducted using EViews statistical software. Prior to model estimation, diagnostic checks are performed to test for stationarity, multicollinearity, and heteroskedasticity in the data to ensure the robustness and validity of the regression outcomes.

Model Specification

The general panel regression model for this study is specified as follows:

$$ROE = \beta_0 + \beta_1TEMP + \beta_2RAIN + \beta_3FWE + \beta_4ENV + \mu + \varepsilon$$

Results and Discussion

Where:

ROE = Return on Equity of bank i at time t; TEMP = Temperature change; RAIN = Rainfall variability; FWE = Frequency of extreme weather events; ENV = Environmental degradation index; μ = Bank-specific unobserved effect; ε = Stochastic error term

Environmental Indicators	Environmental Degradation Rates	Pollution Levels	Rainfall Variability
Year	Annual Change (%)	Air Quality Index	Annual Change (%) ⁹

Source: E-view7.0 (2025)

Table 4.3 provides a summary of the descriptive statistics for the study variables, namely Return on Equity (ROE), Temperature Change (TEMP), Rainfall Variability (RAIN), Frequency of Extreme Weather Events (EWE), and Environmental Degradation (ENV). The average ROE stands at 0.0649, reflecting relatively modest profitability levels across the sampled banks. The standard deviation of 0.3034 indicates notable dispersion in performance. The positive skewness value of 2.3909 and a high kurtosis score of 63.3936 suggest the presence of significant outliers and a heavy-tailed distribution. These departures from normality are statistically confirmed by the Jarque-Bera test, which indicates a non-normal distribution at the 1% significance level. In the case of TEMP, the mean value is 0.04395, with relatively minimal variation (standard deviation = 0.0601). However, the distribution is markedly skewed to the right (2.8621) and leptokurtic (15.9587), indicating the occurrence of sporadic extreme temperature changes. Similarly, RAIN has a very low mean of 0.01443, but displays

extremely high skewness (15.7602) and kurtosis (253.3415), suggesting rare but intense fluctuations in rainfall.

The variable EWE records a mean of 1.5603, but is characterized by high volatility and extreme values, as shown by its skewness (16.1544) and kurtosis (261.9767). Environmental Degradation (ENV) follows a similar pattern, with a low average value (0.1370) accompanied by substantial dispersion and the presence of extreme outliers, indicated by a skewness of 15.5092 and kurtosis of 247.6523. For all the variables under study, the Jarque-Bera statistics are statistically significant ($p < 0.01$), reinforcing the conclusion that the distributions deviate significantly from normality.

Stationarity Test

Panel unit root tests (such as Levin-Lin-Chu and Im-Pesaran-Shin tests) were conducted to assess the stationarity of the variables. All variables were found to be stationary at level, suggesting that they are suitable for regression analysis without differencing.

Table 4.3 Panel Unit Root test result

Variable	LLC(Levin, Chut*)	Lin & Shin W-stat	LPS(Im, Pesaran and Integration	Order of	Remarks
	Statistics	p-value	Statistics	p-value	
ROE	-6.12411	0.0000	-2.48152	0.0065	I(0) Stationaryat level
RAIN	-13.9791	0.0000	-5.98683	0.00000	I(0) Stationaryat level
EWE	-6.31463	0.0079	-2.97528	0.0015	I(0) Stationaryat level
ENV	-17.8788	0.0000	-8.93847	0.00000	I(0) Stationaryat level
ROE	-9.16390	0.0000	-4.27973	0.0000	I(0) Stationaryat level

Source: E-view7.0(2025)

The results of the panel unit root tests for the study variables—Temperature Change (TEMP), Rainfall Variability (RAIN), Frequency of Extreme Weather Events (EWE), Environmental Degradation (ENV), and Return on Equity (ROE)—are summarized in Table 4.2, using both the Levin, Lin & Chu (LLC) and Im, Pesaran and Shin (IPS) methodologies. For each variable, the test statistics were significantly negative, with p-values less than 0.01, indicating strong rejection of the null hypothesis of a unit root and confirming stationarity at level. Specifically, TEMP recorded LLC and IPS values of -6.12411 ($p = 0.0000$) and -2.48152 ($p = 0.0065$) respectively, while RAIN showed even stronger stationarity with LLC at -13.9791 ($p = 0.0000$) and IPS at -5.98683 ($p = 0.0000$). Similar patterns were observed for EWE, ENV, and ROE, all of which also had highly significant p-values across both tests. These outcomes confirm that all variables are integrated of

order zero, $I(0)$, and therefore meet the preconditions for inclusion in the panel regression model without requiring differencing or transformation.

Multicollinearity Test

It is important to check for multicollinearity among the independent variables. We will consider two recognized tests that can detect multicollinearity. These tests are: the tolerance test and the variance inflation factor test (VIF). According to Menard (2002), a tolerance value of less than 0.1 indicates a certain and serious collinearity problem. On the other hand, Myers (1990) indicated that VIF value of greater than 10 must call for a concern of multicollinearity. Table 4 shows the results. We could see that none of the tolerance level is below 0.1 and the VIF values are well below 10. Therefore, multicollinearity is not a problem or concern for this study

	VIF	1/VIF
RAIN	2.02	0.495
EWE	3.06	0.326
ENV	3.13	0.319
TEMP	1.01	0.991

The Variance Inflation Factor (VIF) results indicate that multicollinearity is not a concern among the independent variables, as all VIF values are below the commonly accepted threshold of 10. Specifically, RAIN, EWE, and ENV have VIF values of 2.02, 3.06, and 3.13 respectively, while TEMP has the lowest VIF at 1.01, suggesting minimal correlation with the other variables. The corresponding 1/VIF values further support the absence of severe multicollinearity, confirming the reliability of the regression estimates.

Heteroskedasticity Test

Heteroskedasticity occurs when the standard deviations of a predicted variable, monitored over different values of an independent variable, are non-constant (Adam, 2022). The heteroscedasticity test aims to determine whether the data is homogeneous or not, in other words, **Table 4.4. Heteroskedasticity Test: Breusch-Pagan-Godfrey**

the data do not have any heteroscedasticity problems (Almeyda, & Darmansya, 2019). If heteroskedasticity exists, it implies that the population used in the regression contains unequal variance, and the analysis results may be invalid. The presence of heteroscedasticity tends to produce p-

F-statistic.	0.453354.	Prob.F(2,7).	0.6529
Obs*R-squared.	1.146758.	Prob.Chi-Square(2)	0.5636
Scaled explained SS	0.453594	Prob.Chi-Square(2)	0.7971

SOURCE: E-view 7.0 (2025)

The Breusch-Pagan-Godfrey test results reveal no evidence of heteroskedasticity, as indicated by the F-statistic probability of 0.6529 and the Obs*R-squared probability of 0.5636, both of which are greater than the 0.05 significance level. This suggests that the variance of the residuals is constant, confirming the homoskedasticity assumption of the regression model.

The panel regression results show that temperature (TEMP), extreme weather events (EWE), and environmental degradation (ENV) have a statistically significant positive impact on return on equity (ROE) at the 5% level, as indicated by their low p-values (0.0051, 0.0003, and 0.0020 respectively). Rainfall (RAIN), however, is not statistically significant with a p-value of 0.2377. The model exhibits a very high explanatory power, with an R-squared of 0.9859 and an adjusted R-squared of 0.9812, suggesting that approximately 98% of the variation in ROE is explained by the independent variables. The F-statistic of 210.0756 with a probability of 0.0000 confirms the

overall significance of the model, while the Durbin-Watson statistic of 2.1557 suggests no major autocorrelation problem in the residuals.

Test of Hypotheses

H01: Temperature change does not have any significant effect on banks' return on equity.

From the regression result, the p-value for TEMP is 0.0051, which is less than 0.05. Therefore, the null hypothesis is rejected. Therefore temperature change has a significant effect on banks' return on equity.

H02: Rainfall variability does not significantly affect Nigeria banks' return on equity.

The p-value for RAIN is 0.2377, which is greater than 0.05. Thus, we fail to reject H02, meaning that rainfall variability does not have a significant effect on banks' return on equity.

H03: Extreme weather events do not have any significant impact on Nigeria banks' return on equity.

The p-value for EWE is 0.0003, which is less than 0.05. Therefore, we reject H03 and conclude that extreme weather events have a significant impact on banks' return on equity.

H04: Environmental degradation does not have any significant effects on banks' return on equity in Nigeria.

The p-value for ENV is 0.0020, which is less than 0.05. Hence, we reject H04 and conclude that environmental degradation significantly affects banks' return on equity.

Discussion of Findings

Effect of temperature change on banks return on equity in Nigeria

The findings of the study revealed that temperature change has a statistically significant effect on banks' return on equity (ROE) in Nigeria. Based on the regression output, the coefficient for temperature change was positive (8262.137) and the corresponding p-value (0.0051) was less than the 5% level of significance, thus leading to the rejection of the null hypothesis. This implies that variations in temperature exert a considerable influence on the profitability of banks, indicating that as temperature patterns shift, they create economic and operational pressures that affect the financial outcomes of banking institutions. This result corroborates the findings of Ghosh (2020) who reported that changes in climatic variables, particularly temperature, directly affect loan performance and operational risk profiles of financial institutions. Similarly, Battiston and Monasterolo (2019) found that banks exposed to sectors vulnerable to physical climate risks, such as agriculture and real estate, face heightened volatility in their equity returns due to temperature shocks. In the Nigerian context, the significance of temperature change can be linked to its cascading effects on key economic sectors supported by banks, leading to higher default rates, reduced asset values, and increased credit risks, which ultimately erode return on equity. Thus, temperature change emerges as a critical environmental factor that financial institutions must increasingly incorporate into their risk management and strategic planning frameworks.

The study's findings are further supported by the work of Fiedler, Nolte, and Steudle (2021), who emphasized that temperature-induced shocks could significantly impair the performance of banks by increasing operational costs, destabilizing investment portfolios, and elevating the probability of systemic liquidity challenges. De Greiff and Munoz (2022) also highlighted that marginal fluctuations in temperature significantly distort financial performance metrics, especially in emerging economies where financial resilience mechanisms are relatively weak. In the Nigerian banking sector, the sensitivity of loan portfolios to weather-dependent industries such as agriculture, manufacturing, and energy amplifies the transmission of temperature shocks into reduced profitability. Furthermore, as banks increasingly engage in long-term financing and infrastructural development projects, the risks posed by climate variability become more entrenched in their balance sheets. Consequently, the study underscores the urgent need for Nigerian banks to adopt climate-responsive strategies, including stress testing for temperature-related risks and integrating environmental factors into credit appraisal processes, to safeguard their profitability and ensure long-term sustainability in the face of a changing climate.

Impact of Rainfall Variability on Bank Return on Equity in Nigeria

The results from the panel regression analysis indicated that rainfall variability does not exert a statistically significant effect on banks' return on equity (ROE) in Nigeria. Although the coefficient of rainfall variability was positive (1170.912), the p-value associated with the variable (0.2377) was greater than the conventional 5% significance level, thus leading to the acceptance of the null hypothesis. This suggests that, within the sampled period, fluctuations in rainfall levels did not produce material changes in the profitability performance of banks. One plausible explanation for this outcome lies in the structural diversification of Nigerian banks' loan portfolios across sectors less immediately sensitive to rainfall patterns, thereby diluting the potential transmission channels through which rainfall shocks could affect financial returns. In line with this finding, Akinsanmi and Akinbobola (2021) observed that in the broader African context, financial sector returns demonstrate relative insulation from singular climatic factors such as rainfall variability when economic exposure is spread across both rain-dependent and rain-independent industries.

Moreover, existing literature supports the idea that although rainfall variability introduces environmental uncertainty, its impact on banks' financial indicators is often indirect, mediated through lagged economic variables. For instance, Lawal, Izevbigie, and Oyeibanji (2019) emphasized that agricultural sector volatility arising from rainfall irregularities may affect rural credit markets but has minimal immediate effect on the profitability ratios of urban-centered commercial banks. Complementarily, the work of Okorie and Uchenna (2022) on climate change and Nigerian financial institutions indicated that rainfall changes primarily affect microfinance and agricultural banks more severely than large commercial banks, whose asset bases and income streams are more diversified and less directly tied to rainfall-dependent sectors. Therefore, in the Nigerian banking landscape, the resilience to rainfall variability could be attributed to the increasing sophistication of financial products and the sector's gradual shift towards digital and service-based transactions that are less vulnerable to climatic fluctuations.

In addition, it is crucial to consider that the intensity and immediacy of climate factors such as rainfall on financial outcomes are often context-specific, depending on the interplay between environmental exposure, institutional risk management capacity, and government policy responses. The findings of the current study resonate with the conclusions drawn by Bello and Sanusi (2023), who argued that in middle-income economies like Nigeria, environmental risks linked to rainfall tend to manifest through secondary macroeconomic variables, such as inflation and GDP growth, rather than through direct impacts on bank profitability. As a result, although rainfall variability is a significant climatic concern for broader economic stability, its isolated impact on return on equity within Nigeria's banking sector appears muted and statistically insignificant over the observed period. This underscores the importance of adopting multi-dimensional risk assessment frameworks that capture the complex, indirect pathways through which climate variability may eventually influence banking sector performance over a longer horizon.

Effect of the Frequency of Extreme Weather Events on Return on Equity in Nigeria

The findings from the regression analysis reveal that the frequency of extreme weather events (EWE) has a statistically significant and positive effect on the return on equity (ROE) of Nigerian banks, with a coefficient of 0.000380 and a highly significant p-value (0.0003).

This suggests that the more frequent the extreme weather events, the higher the profitability of banks, as reflected by their return on equity. Such a result may initially seem counterintuitive, as extreme weather events are typically associated with negative environmental and economic shocks. However, it is plausible that banks operating in regions prone to extreme weather may have adapted to these risks over time, developing more robust disaster response frameworks and diversifying their portfolios to minimize the impact of such events on their operations. For instance, banks may have adjusted their lending practices, focusing on more resilient sectors or offering products that mitigate financial risks posed by extreme weather. The findings of Aslam and Choi (2019) support this interpretation, as they observed that banks in disaster-prone areas often experience a boost in profitability due to the increased demand for credit facilities to support rebuilding and recovery efforts following extreme weather events.

Moreover, the positive relationship between extreme weather events and ROE can also be seen as a result of the increased awareness and investment in climate risk management by Nigerian banks. In recent years, many financial institutions in Nigeria have integrated climate-related risks into their risk management frameworks, resulting in enhanced preparedness to deal with the economic fallout from extreme weather. Banks have also capitalized on the rising demand for insurance products and investment opportunities related to climate resilience, thereby improving their profitability in the face of increasing weather events. This is consistent with the findings of Okereke and Adeyemi (2021), who reported that Nigerian banks with well-developed environmental risk management strategies were able to leverage opportunities created by climate adaptation projects, such as green financing and environmental insurance, to enhance their returns. Consequently, the relationship observed between extreme weather events and return on equity aligns with the broader trend of banks turning climate risks into business opportunities, thereby mitigating potential losses and improving their financial performance.

Effect of Environmental Degradation on Banks' Return on Equity in Nigeria

The analysis of environmental degradation (ENV) indicates a positive and significant effect on the return on equity (ROE) of Nigerian banks, with a coefficient of 7819.632 and a highly significant p-value of 0.0020. This suggests that as environmental degradation intensifies, the return on equity for banks also increases.

A possible explanation for this finding is that banks may benefit from increased demand for financing solutions related to environmental recovery and infrastructure improvement in areas facing environmental degradation. As regions experience the adverse effects of environmental degradation, there may be greater investments in environmental rehabilitation, green technology, and sustainability projects, leading to higher demand for loans and financial products. This trend aligns with the findings of Abiola and Mbah (2020), who highlighted that financial institutions in regions affected by environmental degradation often see higher loan demand as businesses and individuals seek financial support for mitigation and adaptation strategies.

Furthermore, the positive impact of environmental degradation on bank profitability could be attributed to the growing interest in sustainable finance and environmental projects within Nigeria. As environmental concerns escalate, there is a rising awareness among banks of the importance of integrating sustainability into their financial offerings. Nigerian banks have increasingly funded projects aimed at reducing the impacts of environmental degradation, such as renewable energy investments, pollution control projects, and climate adaptation efforts. This increased focus on sustainability has allowed banks to tap into new markets, leading to improved profitability and enhanced ROE. Similar findings were noted by Akinlo and Akinboboye (2019), who observed that banks investing in green and sustainable projects in Nigeria not only contributed to environmental improvement but also experienced improved financial performance due to growing demand for such initiatives. Therefore, the positive relationship between environmental degradation and ROE can be interpreted as an opportunity for Nigerian banks to align their financial strategies with the need for environmental remediation, thereby enhancing both their societal impact and profitability.

Summary

This study sought to investigate the impact of climate change factors, specifically temperature change, rainfall variability, extreme weather events, and environmental degradation, on the return on equity (ROE) of Nigerian banks. The study employed panel regression analysis on data gathered over a 10-year period, focusing on four key variables: temperature change (TEMP), rainfall variability (RAIN), extreme weather events (EWE), and environmental degradation (ENV). The results revealed significant effects of

temperature change, extreme weather events, and environmental degradation on banks' ROE, with temperature change and environmental degradation showing a positive and significant relationship. Rainfall variability, however, did not significantly impact ROE. These findings underscore the critical role of climate change and environmental factors in shaping the financial performance of banks, particularly in economies like Nigeria, where such factors are becoming increasingly prevalent. The study also applied diagnostic tests, including unit root tests, variance inflation factor analysis, and heteroskedasticity tests, to ensure the robustness of the regression results.

The analysis found a positive and significant effect of temperature change on banks' return on equity. This suggests that higher temperatures correlate with better financial performance in the banking sector, possibly due to increased demand for financing related to climate adaptation and mitigation projects.

Rainfall variability was not found to significantly affect banks' ROE in Nigeria. While this might seem counterintuitive given the significant impact of rainfall on agriculture and the economy, it suggests that banks may have adopted risk management strategies that mitigate the financial risks associated with rainfall fluctuations.

Extreme weather events exhibited a strong positive effect on ROE, indicating that Nigerian banks may benefit from increased demand for financial products and services related to disaster recovery and adaptation projects. This highlights the growing need for financial products tailored to climate-related risks.

Environmental degradation was found to have a positive and significant effect on ROE. This result suggests that banks in Nigeria could capitalize on the growing demand for financing solutions to address environmental challenges, such as green projects, renewable energy initiatives, and environmental remediation efforts.

Conclusion

The study concludes that climate change factors, including temperature change, extreme weather events, and environmental degradation, significantly influence the return on equity (ROE) of Nigerian banks. This underscores the need for banks to consider environmental factors in their risk management and investment strategies. The positive impact of temperature change and environmental degradation on ROE could indicate a growing market for financing

environmental sustainability initiatives. On the other hand, the insignificant effect of rainfall variability suggests that its impact on bank profitability may be mediated by other factors, such as effective risk management strategies.

Recommendations

1. Nigerian banks should integrate climate risk into their strategic planning and risk management frameworks to ensure sustainable growth and profitability. This can be done by developing financial products and services tailored to climate change adaptation and mitigation projects.
2. Banks should increase their focus on green financing and environmental sustainability initiatives. This can include offering loans for renewable energy projects, funding for climate resilience, and promoting sustainable investments, which could not only benefit the environment but also improve the banks' financial performance.
3. Nigerian banks should invest in climate risk assessment tools and data analytics to better understand and manage the financial risks associated with climate change.

Abstract

This study investigated the effect of green knowledge management strategies on employees' green performance of selected Small and Medium Enterprises (SMEs) in Anambra State, Nigeria. The study is grounded in the knowledge-based view theory, which emphasizes the generation of knowledge within the organization for gaining a competitive advantage. The research design method adopted was descriptive survey design. With a total population of 1,200 staff of 10 selected SMEs, the sample size of 291 was drawn applying the Krejcie and Morgan (1970) table of sample size determination. The research instrument applied was a structured questionnaire, and a simple random sampling technique was adopted in the administration of the questionnaire. The instrument's reliability was confirmed with a Cronbach Alpha (α) index. Data analysis was conducted using Pearson correlation and Ordinary Least Squares (OLS) multiple regression via SPSS version 22. Findings revealed strong, positive, and statistically significant relationships between all green knowledge management components and employees' green performance. Notably, green knowledge acquisition had the most substantial effect ($\beta = 0.592$), followed by knowledge sharing ($\beta = 0.226$) and knowledge creation ($\beta = 0.138$). The study concludes that green knowledge management significantly enhances employees' green performance in SMEs and recommends policies that will encourage green knowledge management practices among SMEs in Anambra State.

Keywords: Green Knowledge Management, Green Knowledge Creation, Green Knowledge Acquisition, Green Knowledge Sharing, Employee Green Performance. Small and Medium Enterprises (SMEs)

Introduction

Recently, employee green performance has become a burning issue in environmental management and sustainable economic development (Hien, 2025). As the world struggles to combat the challenges posed by environmental degradation, organizations are desirous, including individuals making frantic efforts to improve their green knowledge and skills and to come up with innovative ideas to solve the myriads of environmental issues and implement eco-friendly initiatives for business continuity. This requires creativity and collaborative efforts, as technological development has evolved to aid or complement human efforts (De Barros et al., 2025).

Employee performance is a multifaceted concept that has no clear-cut definition (Ghalem et al., 2016). It refers to the effective and efficient use of experiences, knowledge, skills, and talents to carry out specified tasks and to achieve organizational objectives (Alghamdi, 2021). Performance is perceived in terms of commitment to achieving eco-friendly objectives and sustainable development (Gomes et al., 2024). An employee's performance cannot be evaluated unless there is a standard of measurement. This standard is usually set by the organization to enable it to appraise the workers. This becomes very important since employee performance to a great extent determines organizational performance (Yang & Li, 2023). Employee job performance is mainly measured by

quantity (amount of work) and quality (how well they do compared to peers), using self-reported performance data (Arulrajah et al., 2016). The quantity and quality of work done to preserve the environment for sustainable development is referred to as employees' green performance.

In today's fast-changing world, knowledge is the key driver of organizational operations, ensuring a firm's survival and profitability (Wyszkowska-Kuna, 2020) and promoting innovation, productivity, sustainability, and overall organizational success (Ngoc Huynh et al., 2024). To achieve success and guarantee sustainability, organizations are expected to focus on improving the performance of employees, as it determines the overall success of the organization (Alghamdi, 2021). This requires effective knowledge management practices such as knowledge creation, acquisition, and sharing. Green knowledge management (GKM) has become crucial for gaining a competitive edge, as it impacts employees' environmentally friendly performance (Khan et al., 2024). According to El-Kassar and Singh (2019), as referenced by Polas et al. (2021), the key knowledge management factors influencing SMEs' adoption of green innovations are knowledge acquisition, sharing, and responsiveness. Al-Faouri (2023) identified five dimensions of the green knowledge management process, which include knowledge acquisition, storage, dissemination, utilization, and creation. A situation whereby tacit knowledge, which is a personalized and undocumented knowledge (Gamble, 2020), is formalized, communicated, and made understandable through some form of documentation or explanation, creates knowledge (Corcione et al., 2024). To achieve organizational objectives, knowledge needs to be acquired by individuals and groups within the organization. Knowledge acquisition is the process of acquiring and disseminating information on environmentally sustainable methods, concepts, and technologies (Baquero, 2024). Its sources could be internal or external (Wyszkowska-Kuna, 2020). The knowledge acquired is expected to be disseminated among critical stakeholders in the organization for the implementation of environmental protection objectives. Sharing knowledge is all about putting into practice the knowledge about environmental protection (Widyanti et al., 2024). This knowledge must be nurtured, properly organized, and preserved for ease of retrieval. This, according to Abu Rumman and Hiasat (2023), is referred to as knowledge storage. According to Al-Faouri (2023), ecological information and technologies have to be utilized for the purpose of protecting the ecosystem.

Despite the role of SMEs in driving the economy (Gherghina et al., 2020), many now struggle to enshrine green practices into their operations, perhaps

due to a dearth of green knowledge management strategies. This makes it difficult for employees to practice eco-friendly behavior, thereby affecting organizational sustainability and competitiveness. Against this backdrop, this study examines the relationship between green knowledge management strategies and employees' green performance in selected SMEs in Anambra State, Nigeria.

REVIEW OF RELATED LITERATURE

Theoretical Underpinning- Knowledge Based-View (KBV) Theory

The theory of knowledge-based view (KBV) of the firm was rooted in the stakeholder theory, resource-based view (RBV) of the firm, and organizational theory (Parekh & Wright, 2024). Leveraging the RBV theory, KBV proposed that knowledge generated within the organization is a veritable asset that can be used as a source of competition within the industry (Khan et al., 2024) since knowledge, particularly tacit knowledge, can't be easily imitated or copied by the competitors (Gamble, 2020). Furthermore, knowledge resources in SMEs are built over the years, thereby enhancing their performances, sustainability, and maintenance of competitive advantage (Olubiya et al., 2024). The knowledge held in an organization is an important resource that influences organizational success—performance, competitive advantage, and sustainability (Igbakoyi et al., 2024). This presupposes a nexus between organizational capacity to retain competitive advantage and effective resource (knowledge) management. According to KBV, enterprises are structures that synthesize knowledge resources and coordinating mechanisms into profitable tasks of the firm's core abilities (Parekh & Wright, 2024). The deployment of information technologies and its linkage with knowledge management practices have been found to improve knowledge creation, acquisition, and sharing, thus improving their performances (Alemu, 2025).

Conceptual Review of Literature & Hypotheses Formulation

Green Knowledge Management

An organization's capacity to learn, retain, and apply knowledge is crucial for its growth, innovation, and sustainability (Widyanti et al., 2024). In literature, organizations leverage Knowledge Management (KM) to enhance customers' satisfaction and gain a competitive advantage in the market (Khan et al., 2024). Knowledge management (KM) plays a vital role in enhancing organizational success (Al-Faouri, 2023). In this context, Green Knowledge Management (GKM) is the deliberate effort to tap into and utilize the valuable knowledge embedded within an organization's social framework, promoting eco-friendly practices and

sustainability (Sahoo et al., 2024). Moreover, the focus of GKM is to integrate environmental awareness into knowledge management practices, thereby promoting sustainability and green initiatives (Ghorbani, 2023). It is imperative to note that GKM goes beyond just environmental information, encompassing a wide range of strategies and practices that promote sustainable development across ecological, social, and economic dimensions (Yu et al., 2022). In the opinion of Iliescu (2024), GKM evolves from researchers' endeavors to expand the knowledge management discipline by incorporating environmental sustainability goals, thereby broadening its scope and impact. Meanwhile, GKM facilitates decision-making by providing useful environmental information (Al-Husain, 2025). Detailed information about the environment, such as pollution, waste, etc., and their impact on society tends to empower the management in decision-making. Knowledge management supports innovation, resulting in sustainable development (Qadeer & Rafi, 2024). The study of Abdelwahed et al. (2025) revealed that GKM constructs, including green knowledge acquisition, green knowledge dissemination, and green knowledge responsiveness, are positively and significantly correlated with green innovation. Furthermore, it was found that knowledge management influences green innovation and corporate sustainable development (Abbas & Sagsan, 2019). Effective knowledge management boosts green innovation, leading to sustainable performances (Cong, 2024). The study conducted by Weina and Yanling (2022) showed that knowledge management practices are closely linked to environmental sustainability, environmental awareness, and green technology adoption. This implies that knowledge management is crucial in supporting eco-friendly initiatives.

Employee Green Performance

Employee performance has grown in importance in modern organizations, especially where knowledge-based work is key (Berisha et al., 2025). Performance is a multidimensional concept that is often used without a clear definition (Ghalem et al., 2016). It refers to achieving specific tasks like accuracy, completeness, cost, and speed (Soressa & Zewdie, 2021). Therefore, employee green performance measures the level of involvement and commitment of employees in achieving cleaner production and environmental protection within an organization (Arulrajah et al., 2016). According to Hoang et al. (2025), it is referred to as the extent to which employees achieve their assigned environmental task. The commitment of organizational members toward environmental protection and sustainability is referred to as green employee performance (Gomes et al., 2024). Encouraging green creativity is important in the

evaluation of employees' green performance and organizational competitiveness (Saleem et al., 2024). The factors identified as affecting employees' green performance include organizational citizenship behavior for the environment (OCBE), green performance appraisal, and green compensation and rewards (Ardiza et al., 2021). Other factors include green training and development (Olaiya & Olaosebikan, 2022) and knowledge sharing and green organizational commitment (Yang & Li, 2023). This suggests that employee performance measures the behaviors or actions relevant to the attainment of an organization's green initiatives. Doing what an employee is paid for in an organization at the right time suggests performance (Ranta & Ylinen, 2024).

Green Knowledge Creation and Employee Green Performance

Knowledge has been recognized as an intangible asset that can be used as a source of competition in the market (Corcione et al., 2024; Ramírez et al., 2011). The success and/or the failure of any organization depends on the kind of knowledge created and shared within the organization (Abbas & Khan, 2023). Knowledge is a complex idea with different meanings (Agrifogli et al., 2021). Knowledge, or information that has been processed (Bratianu, 2015), can be classified into two types: explicit and tacit knowledge (Ibojo & Mobolade, 2023). Tacit knowledge is personal and held in individual minds, not documented or formalized (Gamble, 2020). It is the knowledge that exists but is not formalized or written down (Corcione et al., 2024). On the other hand, explicit knowledge is the type of knowledge that is codified and can be found in documents, manuals, or databases (Abbari et al., 2019). This kind of knowledge has been formalized, communicated, and made understandable through some form of documentation or explanation (Corcione et al., 2024). However, it is believed that the knowledge possessed by individuals in the organization, both explicit and tacit, serves as a source of creating knowledge if shared. Transforming an individual's tacit knowledge into explicit knowledge at a group or organizational level leads to knowledge creation. Hence, green knowledge creation involves coming up with a fresh idea, thought, or information on environmental protection (Cong, 2024). Developing new ideas, discovering trends that were originally unidentified, combining different fields, and creating new processes are all examples of knowledge creation (Olubiyi et al., 2024). According to Lyles (2014), cited in Nonaka et al. (2014), businesses can create knowledge internally through research and development or by coming up with novel approaches to problems. Three essential components of the knowledge management cycle are the generation of knowledge,

transmission, and application (Adewuyi, 2021). The empirical study carried out by Ngoc Huynh et al. (2024) revealed that green knowledge management has a positive and significant effect on green innovation. Green knowledge sharing improves organizational performance (Khan et al., 2023).

H01: There is no significant positive relationship between knowledge creation and employees' green performance.

Green Knowledge Acquisition and Employee Green Performance

Knowledge acquisition is an important aspect of knowledge management (Brewster, Ciravegna & Wilks, 2001). This is because of its role in promoting innovation (Ngoc Thang & Anh Tuan, 2020) and green performance in the organization (Baquero, 2025). Information is a key; its proper management can enhance innovative ideas and a firm's sustainable competitive advantage (Nyuga & Tanova, 2024). SMEs require useful environmental information that aids strategic decision-making (Krakauer, 2016). These can be obtained from different sources: internal and external (Indris & Primiana, 2015). The capacity of a company to tap into different information sources to create green business insights that employees can use for strategic decision-making is referred to as green knowledge acquisition (Sahoo et al., 2022). It involves gaining and distributing knowledge focused on eco-friendly practices, principles, and technologies (Baquero, 2024). It is a process of obtaining knowledge from sources, organizing it, and disseminating it to a knowledge base and maybe into a system that uses it for reasoning (Aronson, 2003).

According to Gamble (2020), tacit knowledge helps organizations maintain a sustainable competitive edge since competitors can't easily duplicate it in their own context. Green knowledge acquisition has a positive impact on green knowledge management and technological innovation (Sahoo et al., 2022). There is a positive and significant effect of green acquisition on organizational performance (Ibojo & Mobolade, 2023). Acquiring technical knowledge from outside and gaining market knowledge both positively impact corporate green innovation (Guo, 2023). The study of Abu Rumman and Hiasat (2023) revealed that there is no positive significant influence of knowledge acquisition on green performance in private hospitals in Amman. Conversely, Ibojo and Mobolade (2023) posited that knowledge acquisition positively and

significantly influences the organizational performance of selected manufacturing firms in Oyo State, Nigeria. Knowledge management dimensions such as knowledge acquisition, dissemination, and application were found to positively influence sustainability development practices (Shahzad et al., 2021; Al-Faouri, 2023).

H02: There is no significant positive relationship between knowledge acquisition and employees' green performance.

63200Green Knowledge Sharing and Employees' Green Performance

The goal of many businesses is the promotion of eco-friendly practices for organizational sustainability (Ansong et al., 2024). This requires dissemination of green knowledge. Green knowledge sharing is akin to knowledge application that enables employees to apply what they have been taught (Yu et al., 2022). In a green context, knowledge sharing means exchanging ideas, experiences, and best practices related to sustainability and protecting the environment among people in an organization (Ansong et al., 2024). Cross-sector partnerships and collaborative platforms play a big role in sharing knowledge, which is crucial for innovation in things like renewable energy and reducing waste (Saleem et al., 2024). Sharing knowledge entails individuals and groups exchanging knowledge and skills, which promotes a cooperative and learning-focused culture that is essential for creativity and problem-solving (Nazim & Mukherjee, 2016). Green knowledge sharing represents the extent to which eco-friendly information is being propagated (Khawaja & Janjua, 2025). The process of exchanging knowledge results in mutually dependent outcomes for both parties (Bratianu, 2015). By sharing knowledge about sustainable practices, organizations can innovate more efficiently, cutting down on time and resources needed for new green technologies or processes (Saleem et al., 2024). The result of the study carried out by Agrifogli et al. (2020) revealed that the implementation of green human resource management practices produces a positive effect on eco-friendly behavior and green performance with commitment mediating their relationships. Green performance is positively and significantly influenced by knowledge sharing with green creativity mediating (Saleem et al., 2024).

H03: There is no significant positive relationship between knowledge sharing and employees' green performance.

Conceptual Framework of Variables

~~Conceptual Framework: Figure 1 shows the link between green knowledge management strategies and employees' green performance.~~

Figure 1: Researcher's Model

MATERIALS AND METHODS

This study adopted the descriptive survey design method. As Siedlecki (2020) notes, descriptive surveys aim to accurately capture the characteristics of specific individuals, situations, or groups.

The population of this study is drawn from ten (10) selected SMEs in Anambra State. The total population of the employees in the firms was 1200. Applying the Krejcie and Morgan table (1970), 291 employees were selected from sampled SMEs in Anambra State. To collect primary data from the respondents, structured questionnaires made up of sections A and B were administered. Section A captured information relating to the respondent's biographical data, while Section B captured questions relating to the research hypotheses. Cronbach's alpha analysis was administered to obtain the reliability of the study instrument. Inferential analysis assists in understanding relationships between the study variables. In order to meet the research objectives of the study, all valid responses were assessed using Ordinary Least Square (OLS) multiple regression via the use of Statistical Package of Social Sciences (SPSS) version 22. OLS multiple regressions were used to predict whether there is any significant effect of the independent variables (knowledge creation,

knowledge acquisition, and knowledge sharing) on the dependent variable (employee's green performance).

3.1. Model Specification and Estimation Strategy

This study is concerned with Green Knowledge Management Strategies (GKMS) and Employees' Green Performance (EGP).

$$EGP = f(GKMS) \text{-----} (1)$$

Green knowledge management strategies (GKMS) include; Green Knowledge Creation (GKC), Green Knowledge Acquisition (GKA) and Green Knowledge Sharing (GKS).

$$EGP = f(GKC, GKA, GKS) \text{-----} (2)$$

The multiple variate equation model is specified as;

$$EGP = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_n X_n + \mu \text{-----} (3)$$

The regression form of the models is stated as;

$$EGP = \beta_0 + \beta_1 GKC + \beta_2 GKA + \beta_3 GKS + \mu \text{-----} (4)$$

RESULT AND ANALYSIS

A total number of 291 questionnaires were distributed. Out of which, 230 was fully completed and retrieved accounting for 79% return rate.

Table 1:
Socio-Economic Attributes of Participating Employees

Participants' Bio-Data	Responses	Rate (%)
Sex:		
Male:	144	63
Female:	86	37
Total:	230	100
Marital Status:		
Single:	115	50
Married:	110	48
Others:	5	2
Total	230	100
Qualifications:		
O'Level	34	15
ND/Equivalent:	65	28
B.Sc./Equivalent	120	52
Post Graduate	11	5
Total	230	100

Source: Field Survey, 2025

The data in table 1 above revealed that the number of males was 144, which accounted for 63%, while the number of females was 86, representing 37%. Their marital status showed that 115, which is 50%, were single; 110 were married, which is 48%; and 5 were either divorced or widowed, which represents 2%. On

qualifications, 34 were O'Level certificate holders, which is 15%; 65 were ND or its equivalent holders, representing 28%; 120 held a B.Sc. degree, which is 52%; and the number of postgraduate certificates was 11, which represents 5%.

Table 2: Multiple Regression Table

Coefficients ^a					
Model		Unstandardized Coefficients		Standardized Coefficients	Sig.
		B	Std. Error	Beta	
1	(Constant)	.846	.125		6.740
	Green Knowledge Creation	.138	.036	.153	3.820
	Green Knowledge Acquisition	.592	.055	.611	10.719
	Green Knowledge Sharing	.226	.060	.234	3.736

a. Dependent Variable: Employee Green Performance

Table 2 shows the multiple regression analysis results of the coefficient for the components of the effect of Green Knowledge Management Strategies on Employees' Green Performance of Small and Medium Enterprises (SMEs) in Anambra State. The results showed that green knowledge creation ($\beta = 0.138$, $t = 3.820$, and $p\text{-value} = 0.000 < 0.05$), green knowledge acquisition ($\beta = 0.592$, $t = 10.719$, and $p\text{-value} = 0.000 < 0.05$), and green knowledge sharing ($\beta = 0.226$, $t = 3.736$, and $p\text{-value} = 0.000 < 0.05$) all have a positive and significant effect on employees' green performance of small and medium enterprises (SMEs) in Anambra State.

Discussion of Findings

This study's objectives, as well as the hypotheses, have been tested using the appropriate statistical tools, and the findings are discussed below.

Hypothesis One

In line with the study's objective, which is to investigate the relationship between green knowledge creation and employees' green performance, a null hypothesis stating that there is no significant positive relationship between green knowledge creation and employees' green performance of selected SMEs in Anambra State was formulated. However, the result of

the regression analysis ($\beta = 0.138$, $t = 3.820$, and $p\text{-value} = 0.000 < 0.05$) showed that there exists a positive and significant relationship between green knowledge creation and employees' green performance of SMEs in Anambra State. This invalidates the null hypothesis, thereby accepting the alternative hypothesis. By implication, the more green knowledge is being created, the more employees' green performance is being enhanced by 1.4%, since the beta value is $\beta = 0.138$. The reverse is the case of not creating green knowledge in the system. Therefore, an increase in the creation of green knowledge correlates with improved employees' knowledge, capacity to make informed decisions, problem-solving, and most importantly, innovation. This study conforms to the empirical study of Ngoc Huynh et al. (2024), who posited that knowledge management has a positive significant effect on green innovation. By creating knowledge, SMEs are equipped with the capacity to gain competitive advantage, creative and innovative ideas, and adaptation to changing business environments.

Hypothesis Two

The second objective examined the relationship between knowledge acquisition and employees' green performance, accompanied by the null hypothesis stating that there is no significant positive relationship between knowledge acquisition and employees' green performance of selected SMEs in Anambra State. However, the regression result ($\beta = 0.592$, $t = 10.719$, and $p\text{-value} = 0.000 < 0.05$) revealed that there is a positive and significant relationship between green knowledge acquisition and employees' green performance of selected SMEs in Anambra State. This led to the decision of rejecting the null hypothesis and the acceptance of the alternative hypothesis, which states that there is a positive and significant relationship between green knowledge acquisition and employee green performance. This indicates that an increase in green knowledge acquisition in the organization correlates with improved employee green performance output, suggesting that extra green knowledge acquired by employees will lead to improvement in their green performance by 5.92% since the beta value is $\beta = 0.592$, and vice versa. This aligns with the study carried out by Ibojo and Mobolade (2023), who posited that knowledge acquisition positively and significantly influences the organizational performance of selected manufacturing firms in Oyo State, Nigeria. Similarly, knowledge management dimensions such as knowledge acquisition, dissemination, and application were found to positively influence sustainability development practices (Shahzad et al., 2021; Al-Faouri, 2023).

Hypothesis Three

Objective three evaluated the relationship between green knowledge sharing and employees' green performance. This was followed by the null hypothesis stating that there is no significant positive relationship between green knowledge sharing and employees' green performance in selected SMEs in Anambra State. Meanwhile, the regression result ($\beta = 0.226$, $t = 3.736$, and $p\text{-value} = 0.000 < 0.05$) revealed that there exists a positive and significant relationship between green knowledge sharing and employees' green performance. This led to a decision to reject the null hypothesis and accept the alternative hypothesis, which states that a significant positive relationship exists between green knowledge sharing and employees' green performance. By implication, an increase in green knowledge sharing within the organization correlates with improved employees' green performance output, suggesting that extra green knowledge shared within the organization will lead to a 2.3% improvement in employees' green performance and vice versa. This study is in agreement with the study carried out by Agrifogli et al. (2020), who opined that the implementation of green human resource management practices will produce a positive effect on eco-friendly behavior and green performance. Green performance is positively and significantly influenced by knowledge sharing with green creativity mediating (Saleem et al., 2024).

Summary of findings

1. Green knowledge creation has a significant influence on employees' green performance of SMEs in Anambra State. The result of green knowledge creation ($\beta = 0.138$, $t = 3.820$, and $p\text{-value} = 0.000 < 0.05$) showed that for each unit increase in green knowledge creation, employees' green performance is estimated to increase by 0.138 units.
2. Green knowledge acquisition has a significant impact on employees' green performance at SMEs in Anambra State. The result of green knowledge acquisition ($\beta = 0.592$, $t = 10.719$, and $p\text{-value} = 0.000 < 0.05$) showed that for each unit decrease in green knowledge acquisition, employees' green performance is estimated to decrease by 0.592 units.
3. There is a significant relationship between green knowledge sharing and employees' green performance of SMEs in Anambra State. The result of green knowledge sharing ($\beta = 0.226$, $t = 3.736$, and $p\text{-value} = 0.000 < 0.05$) showed that for each unit increase in green knowledge sharing, employees' green performance is estimated to increase by 0.592 units.

Conclusion

Knowledge is a resource within the organization that can be used to gain a competitive advantage. This is because of its inability to be imitated. As

environmental challenges persist, green knowledge management is required of organizations, particularly SMEs in Anambra State, to enhance their employees' green performance for sustainable economic development.

Based on the findings of this study, green knowledge management strategies, such as green knowledge creation, green knowledge acquisition, and green knowledge sharing, all have a positive significant effect on employees' green performance at SMEs in Anambra State. Therefore, the government should formulate policies that will encourage SMEs to create, acquire, and share green knowledge. This will lead to employees' innovation, which results in eco-friendly practices and sustainability of the business and its environment.

Business Attitude and Innovation in Enhancing Apprentices' Growth and Commitment

NWABUEZE, Nnneaka Judith

Department of Business Administration
Delta State University Abraka

Abstract

This study explored how entrepreneurial mindset and innovation contribute to students' growth and engagement within Nigeria's higher education system. Employing a qualitative content analysis of 25 peer-reviewed articles published between 2015 and 2025, and guided by the PRISMA framework, the research ensured methodological rigor and relevance. The findings indicated that an entrepreneurial mindset enhances students' self-efficacy, motivation, and resilience, while innovation promotes creativity, critical thinking, and active participation in learning. Notably, the integration of both elements yielded synergistic benefits, significantly improving students' overall development and readiness for post-graduation opportunities. The study concludes that embedding entrepreneurship and innovation into university curricula is vital for bridging educational and socio-economic gaps in Nigeria. Consequently, it recommends mandatory entrepreneurship-innovation modules, curriculum restructuring, and adequate institutional funding to sustain student engagement and drive national development.

Keywords: Business attitude, Apprentices, commitment, innovation, growth.

Introduction

Entrepreneurial mindset and innovation are vital to fostering student growth, engagement, and employability in the 21st century. Globally, countries such as Finland, Singapore, China, and South Korea have successfully integrated entrepreneurship education into higher education, leading to enhanced creativity, problem-solving, and innovation-driven economies. In contrast, Nigeria faces persistent challenges including underfunded programs, weak institutional support, and outdated pedagogies, resulting in low student engagement and poor entrepreneurial outcomes. Empirical evidence from Nigeria shows that while students often express interest in entrepreneurship, their self-efficacy, readiness, and innovative capacity remain low due to inadequate institutional frameworks and limited exposure to practical learning. Consequently, graduate unemployment and dependency on government jobs persist. Comparative studies from Malaysia and Indonesia demonstrate that effective entrepreneurship education can strengthen innovation behavior and engagement, offering reform models for Nigeria, Malathi (2025). Despite growing recognition of entrepreneurship's importance, research in Nigeria has largely focused on entrepreneurial intentions rather than on how mindset and innovation directly enhance student engagement and personal development. This study, therefore, addresses this gap by examining how entrepreneurial mindset and innovation can strengthen student growth and engagement within Nigerian higher

education. It aims to generate empirical insights that inform curriculum reforms, institutional strategies, and policy initiatives to produce innovative, self-reliant, and globally competitive graduates capable of driving socio-economic transformation.

Problem Statement

Entrepreneurship and innovation are widely recognized as key drivers of student growth, engagement, and employability; however, Nigeria's higher education system continues to struggle in these areas. With graduate unemployment reaching 40.1% (NBS, 2023), many Nigerian graduates lack the entrepreneurial and innovative skills needed for success in a competitive, knowledge-driven economy. Despite the inclusion of entrepreneurship courses in universities and polytechnics, their impact remains minimal due to inadequate funding, theoretical teaching methods, and weak innovation ecosystems. In contrast, nations like South Korea and Singapore have successfully embedded entrepreneurship education into their curricula, producing more employable and engaged graduates. The persistence of disengaged and underprepared graduates in Nigeria reflects deep systemic gaps between curriculum intentions and actual outcomes. While existing research has examined entrepreneurial intentions and institutional challenges, little attention has been paid to how entrepreneurial mindset and innovation directly influence student engagement and personal development. Since engagement serves as a key mediator between

entrepreneurship education and meaningful learning outcomes, this oversight is significant. To address this gap, the present study investigates how entrepreneurial mindset and innovation can enhance student growth and engagement in Nigerian higher education, offering empirical insights to guide effective curriculum reforms and policy interventions.

Research Questions

1. How does entrepreneurial mindset influence students' growth and engagement?
2. In what ways does innovation contribute to enhancing students' growth and engagement?
3. What combined effect do entrepreneurial mindset and innovation have on students' growth and engagement?

Research Objectives

1. To assess the influence of entrepreneurial mindset on students' growth and engagement.
2. To evaluate the contribution of innovation in enhancing students' growth and engagement.
3. To determine the combined effect of entrepreneurial mindset and innovation on students' growth and engagement.

Literature review

Conceptual Review

Conceptualizing the Entrepreneurial Mindset in Higher Education

The entrepreneurial mindset refers to a set of cognitive, emotional, and behavioral orientations that enable individuals to identify opportunities, take calculated risks, and create value in dynamic environments (Daspit, D'Souza, & Ambos, 2023). In higher education, entrepreneurial mindset has been associated with problem-solving, adaptability, and creativity, skills that are crucial for student development and long-term employability (Wardana et al., 2020). Research indicates that this mindset not only shapes entrepreneurial intentions but also strengthens students' learning engagement and resilience (Jiang, Ning, & Wang, 2021). For example, Nigerian students with stronger entrepreneurial self-efficacy tend to set ambitious career goals and are more inclined to pursue innovative ventures after graduation (Osadolor et al., 2021). Achieving conceptual clarity on entrepreneurial mindset, therefore, lays the groundwork for exploring how it can transform student engagement in Nigerian universities.

Within Nigeria, however, limited emphasis on entrepreneurial orientation has weakened graduates' ability to navigate economic instability and persistent unemployment (Adeniyi, 2022). This stands in sharp contrast to global best practices, as seen in countries

such as Finland and Singapore, where entrepreneurial thinking is woven into mainstream curricula to foster innovation and adaptability (Korhonen, Ketonen, & Toom, 2024). Scholars argue that embedding entrepreneurial mindset into Nigeria's higher education system could shift learning away from rote knowledge acquisition toward creativity, initiative, and employability (Oyinlola et al., 2024). Thus, defining entrepreneurial mindset in this study is both a conceptual and contextual necessity, representing a key step toward reshaping Nigerian education to meet the demands of the 21st century.

Innovation as a Driver of Student Growth and Engagement

Innovation in education has been increasingly recognized as a driver of student growth, learning outcomes, and long-term adaptability. It refers not only to technological tools but also to pedagogical models, curricula, and institutional practices that foster creativity and problem-solving (Shadiev, Hwang, & Huang, 2022). Globally, innovative entrepreneurship pedagogy has been associated with opportunity discovery and improved study engagement among nascent entrepreneurs (Lyu, 2024). Liu et al. (2023) further highlighted that entrepreneurship programs that integrate innovation through project-based learning increased both study engagement and entrepreneurial competence. These findings affirm that innovation in higher education transcends technological integration—it fundamentally reshapes student learning experiences.

However, in Nigeria, innovation in entrepreneurship education has been largely underexplored, leaving students less prepared for real-world challenges (Oyinlola et al., 2024). Unlike Asian economies such as China, where entrepreneurial pedagogy has consistently raised entrepreneurial intentions among university students (Sun, 2023), Nigerian universities still face barriers of outdated curricula, limited resources, and poor alignment with labor market realities. Adelowo (2025) emphasized that without embedding innovation in Nigerian entrepreneurship education, graduate entrepreneurship propensity remains unsustainable. Therefore, focusing on innovation as a catalyst for growth and engagement highlights the urgent need to re-engineer Nigerian higher education to align with global standards.

Linking Entrepreneurial Mindset, Engagement, and Self-Efficacy

Student engagement has been described as the extent of students' involvement in their academic, social, and emotional learning processes, which significantly influences academic success and personal development (Amerstorfer, Huber, & Gasteiger-Klicpera, 2021).

Research has consistently shown that entrepreneurial mindset enhances student engagement by fostering proactive learning, resilience, and creativity (Knox, 2022; Korhonen, Ketonen, & Toom, 2024). Jiang, Ning, and Wang (2021) demonstrated that entrepreneurial self-efficacy plays a mediating role between entrepreneurship education and entrepreneurial mindset, linking classroom experiences directly to entrepreneurial intentions. Thus, the combination of entrepreneurial mindset and self-efficacy serves as a motivational framework for enhancing engagement. In Nigeria, however, most entrepreneurship education initiatives have not adequately emphasized self-efficacy and its role in sustaining engagement (Nwibe & Ogbuanya, 2024). Students often report disengagement due to poor curriculum relevance and inadequate institutional support, which reduces their motivation to translate entrepreneurial education into practical outcomes (Adeniyi, 2022). Comparatively, in Europe and Asia, entrepreneurial mindset development has been integrated into study engagement strategies with measurable outcomes in student creativity and entrepreneurial activity (Pham, 2023; Lyu, 2024). Addressing this gap in Nigeria is essential, as enhanced student engagement through entrepreneurial mindset and self-efficacy can directly influence graduate employability and long-term social impact.

The Nigerian Higher Education Context and the Need for Reform

Nigeria's higher education system is confronted with persistent challenges such as high graduate unemployment, weak innovation capacity, and low student participation in entrepreneurial activities (Adelowo, 2025; Oyinola et al., 2024). Although entrepreneurship education has been mandated by the government, its implementation has often been fragmented and poorly aligned with labor market needs (Adeniyi, 2022). Oyinola et al. (2024) observed that while several universities have established entrepreneurship centers, their effectiveness remains limited due to resource shortages and weak student engagement. This has contributed to the widening gap between educational outcomes and graduate employability, further deepening the unemployment crisis.

By contrast, countries such as Finland, South Korea, and Singapore have successfully integrated entrepreneurship and innovation into their education systems, resulting in stronger graduate employability and increased startup creation (Korhonen, Ketonen, & Toom, 2024; Malathi, 2025). Nigeria, however, risks widening its developmental gap if reforms are not prioritized. A major research gap exists in the limited empirical work linking entrepreneurial mindset, innovation, and student engagement in the Nigerian

higher education landscape. Addressing this gap is essential to ensure that universities produce not only graduates with theoretical knowledge but also individuals equipped with creativity, resilience, and an entrepreneurial orientation capable of driving socio-economic transformation.

Theoretical Foundation

Theories provide the conceptual lens for analysing how entrepreneurial mindset and innovation influence student development and engagement. While existing studies on entrepreneurship education in Nigeria have often been descriptive, the use of robust theoretical perspectives helps uncover the mechanisms that shape student outcomes. This study adopts two frameworks—Human Capital Theory and the Job Demands–Resources (JD-R) Theory to explain how entrepreneurship education and innovation promote student engagement, resilience, and employability.

Human Capital Theory

Proposed by Gary Becker in 1964, Human Capital Theory emphasizes that education and skills acquisition represent investments that yield returns in the form of enhanced productivity, innovation, and broader economic growth. It argues that the knowledge, competencies, and experiences gained through education strengthen both individual and societal outcomes (Becker, 1964). Within this study, Human Capital Theory highlights how entrepreneurial mindset and innovation-oriented education prepare students for self-employment while also enabling them to contribute creatively within organisations. For example, Adeniyi (2022) found that Nigerian TVET students with higher entrepreneurial readiness and self-efficacy were more likely to pursue viable ventures, illustrating the tangible returns of investing in entrepreneurial education.

In Nigeria, the relevance of this theory is clear. Universities have historically emphasized theoretical knowledge while neglecting practical entrepreneurial competencies, creating a disconnect between graduate skills and labor market expectations (Adelowo, 2025). By framing entrepreneurial mindset and innovation as key forms of human capital, this study reinforces the need for innovative pedagogies in Nigerian higher education that can produce adaptive, resilient graduates equipped to drive socio-economic transformation.

Job Demands–Resources (JD-R) Theory

The Job Demands–Resources (JD-R) Theory, developed by Demerouti, Bakker, Nachreiner, and Schaufeli in 2001, explains how job demands (such as workload and academic challenges) interact with resources (such as support, autonomy, and opportunities for skill-building) to influence motivation,

engagement, and performance (Demerouti et al., 2001). The theory argues that resources not only buffer the negative impact of high demands but also foster long-term motivation and growth. Applied to education, entrepreneurship programs that provide access to innovation hubs, mentorship, and project-based learning have been shown to enhance engagement and entrepreneurial competence, even in demanding academic contexts (Liu et al., 2023).

This theory is particularly relevant in Nigeria, where many students operate in resource-constrained environments with limited exposure to entrepreneurial ecosystems. The absence of adequate resources contributes to disengagement and low levels of innovation (Oyinlola et al., 2024). By applying the JD-R framework, this study underscores the importance of creating supportive educational environments that can sustain student motivation and foster entrepreneurial outcomes. For example, Khodor et al. (2024) found that student engagement increased significantly when family, institutional, and peer support were present, aligning with the JD-R emphasis on resources as enablers of motivation. Therefore, this theory highlights the need for Nigerian higher education institutions to strategically provide entrepreneurial resources that enhance growth, engagement, and resilience, particularly in resource-scarce environments.

Empirical Review

Daspit, D'Souza, and Ambos (2023) identified the lack of definitional clarity as a key problem in entrepreneurial mindset scholarship, noting that fragmented conceptualizations hindered progress in research and practice. Their purpose was to propose an integrated definition and set a future research agenda. Drawing on institutional and cognitive perspectives, they applied a systematic review method to synthesize over 180 articles. Findings revealed that entrepreneurial mindset encompasses opportunity recognition, resilience, and adaptability, but only 27% of the reviewed studies employed a longitudinal approach, limiting understanding of mindset development. The implication was that without a coherent framework, entrepreneurship education struggles to deliver measurable outcomes. The gap lies in the absence of contextual applications of their integrated framework in African higher education settings, particularly Nigeria, where entrepreneurship has been mandated into the curriculum since 2007.

De la Gala-Velásquez and colleagues (2024) investigated the misalignment between entrepreneurship curricula and the real-world needs of university students, highlighting that outdated course structures undermined mindset development. The study aimed to analyse how curriculum relevance and adequacy influence entrepreneurial orientation. Using

human capital theory, they conducted surveys across multiple Spanish universities. Results showed that 62% of students perceived entrepreneurship courses as outdated, and only 18% felt the curriculum adequately prepared them for entrepreneurial ventures. The implication was that curriculum reform directly impacts student engagement and entrepreneurial readiness. However, the research gap is that their study was limited to European contexts, neglecting Nigeria where curriculum reform is ongoing but understudied in terms of entrepreneurial mindset outcomes.

Jiang, Ning, and Wang (2021) examined the problem of weak translation of entrepreneurship education into actual entrepreneurial intentions. Their purpose was to test whether entrepreneurial self-efficacy mediated the relationship between entrepreneurship education, entrepreneurial mindset, and entrepreneurial intention. Using Bandura's social cognitive theory, they applied a structural equation modeling (SEM) approach with 1,046 Chinese university students. Findings showed that entrepreneurial education significantly influenced mindset ($\beta = 0.52$, $p < 0.001$), which in turn impacted intention, with self-efficacy serving as a full mediator. This highlighted that confidence in entrepreneurial ability is central to turning mindset into action. However, the gap is that the mediating role of self-efficacy has not been empirically tested among Nigerian students, where cultural and institutional barriers differ.

Khodor et al. (2024) addressed the challenge of declining entrepreneurial engagement among adolescents despite increased access to entrepreneurship programs. Their purpose was to explore how individual, family, and school-level factors shape entrepreneurial intentions. Grounded in the theory of planned behavior, they surveyed 2,143 adolescents across Lebanon. Findings showed that family support accounted for 39% of variance in intention, while school support accounted for 22%, with gender moderating the relationship. The implication was that multi-level support systems are critical in fostering engagement. Yet, the gap is that the role of institutional and socio-economic factors in Nigeria, where family obligations and economic instability are distinct, remains underexplored.

Malathi (2025) focused on the persistent gap between entrepreneurial education and actual entrepreneurial engagement among management students in India. The purpose was to test the mediating role of entrepreneurship education. Using the theory of planned behavior, SEM was applied to data from 738 respondents. Findings indicated that entrepreneurship education explained 48% of the variance in entrepreneurial intention, with engagement serving as a partial mediator. The implication was that curriculum design and delivery significantly shaped

entrepreneurial participation. The gap lies in the absence of cross-country validation, particularly in Nigeria, where entrepreneurial engagement rates among graduates remain below 20%.

Nwibe and Ogbuanya (2024) addressed the lack of clarity on how emotional intelligence impacts entrepreneurial intention in Nigeria. Their study aimed to explore the mediating role of self-efficacy domains. Using the social cognitive career theory, they surveyed 814 undergraduates. Findings showed that emotional intelligence predicted 29% of entrepreneurial intention variance through general and task-specific self-efficacy. The implication was that psychological attributes are critical for entrepreneurship education outcomes. The gap is that engagement factors were not integrated, leaving an incomplete picture of mindset formation.

Oyinlola et al. (2024) addressed systemic challenges in entrepreneurship and innovation in Nigerian universities, including underfunding, poor pedagogy, and low graduate entrepreneurial activity. Their study aimed to identify trends, challenges, and opportunities. Using qualitative case study methods across six Nigerian universities, findings showed that only 23% of students pursued entrepreneurship-related activities, while infrastructural deficiencies remained a major barrier. The implication was that Nigeria's higher education sector requires systemic reforms to achieve entrepreneurship education goals. The gap lies in the absence of micro-level analysis on how entrepreneurial mindset and student engagement can improve outcomes within this system.

Pham (2023) explored the problem of limited understanding of e-entrepreneurial intentions in digital economies. The study aimed to test how entrepreneurship knowledge and technological innovativeness impacted e-intentions. Using the resource-based view (RBV), SEM was applied to 476 Vietnamese undergraduates. Findings revealed that technological innovativeness explained 38% of e-intention variance, while knowledge accounted for 27%. The implication was that integrating digital innovation into entrepreneurship curricula is critical. The gap is that similar empirical tests are scarce in Nigeria, where digital entrepreneurship adoption among students is growing.

Methods and Materials

The study employed a qualitative research design based entirely on secondary data to examine the relationship between entrepreneurial mindset and student engagement in Nigerian higher education. Guided by the PRISMA framework, the research ensured rigor and transparency in data identification, screening, eligibility, and inclusion. The study focused on peer-reviewed articles, conference papers, and institutional reports published between 2015 and 2025—a decade marked by Nigeria's mainstreaming of entrepreneurship education and global emphasis on youth employability. A systematic search across databases such as Scopus, Web of Science, Google Scholar, and ScienceDirect yielded 302 records. After applying the PRISMA four-phase process and excluding duplicates and low-quality studies, 25 relevant papers were selected for analysis. These studies, drawn from Nigeria and comparable developing countries, incorporated theoretical frameworks like the Theory of Planned Behavior, Social Cognitive Theory, and the Job Demands–Resources Model to provide conceptual grounding. Data were analyzed through qualitative content analysis using NVivo software, involving coding, categorization, and thematic synthesis. Key emerging themes included curriculum relevance, self-efficacy, digital engagement, and social support. The approach enabled cross-contextual comparisons and offered valuable insights into how entrepreneurial mindset and innovation influence student engagement, providing practical implications for improving Nigeria's higher education system.

Analysis and Discussions

Out of the 32 papers initially selected during the systematic review, only 25 met the inclusion criteria and were deemed relevant for analysis. The excluded papers either fell outside the 2015–2025 timeline, lacked empirical grounding, or did not address entrepreneurial mindset and innovation within higher education contexts. The 25 studies formed the final dataset for qualitative content analysis, ensuring thematic alignment with the study's objectives.

Table 1: Selection of Papers for Analysis

Stage of Review	Number of Papers	Description
Initially identified	302	Records identified through database search (2015–2025)
Screened after duplicates	150	Duplicates and irrelevant titles removed
Selected for eligibility	32	Full texts assessed against inclusion and exclusion criteria
Excluded at eligibility	7	Lacked empirical evidence or relevance to mindset/innovation
Final papers analysed	25	Used for full content analysis and answering research questions

The table demonstrates the systematic narrowing down of papers to ensure rigor and alignment. By focusing on

25 studies, the analysis retained sufficient breadth for

comparative insights while maintaining depth to address the study's research questions effectively.

Analysis of Research Question 1

How does entrepreneurial mindset influence students' growth and engagement?

To address this question, the 25 papers were classified according to the databases from which they were retrieved. The distribution is presented below.

Table .2: Sources of Papers on Entrepreneurial Mindset and Student Growth

Database	Number of Papers	Percentage (%)
DOAJ	5	20%
Google Scholar	8	32%
Scopus	6	24%
Web of Science	4	16%
ScienceDirect	2	8%

The findings showed that entrepreneurial mindset significantly enhanced student self-efficacy, motivation, and academic engagement. Studies such as Jiang, Ning, & Wang (2021) revealed that self-efficacy mediated the link between education and entrepreneurial intention, reinforcing that mindset drives confidence and active participation. Similarly, Daspit, D'Souza, &

Ambos (2023) emphasized the role of mindset as an integrative construct shaping persistence and adaptability among students. These results suggest that students with a stronger entrepreneurial mindset exhibited higher levels of growth and engagement across both academic and extracurricular contexts.

Analysis of Research Question 2

In what ways does innovation contribute to enhancing students' growth and engagement?

Table 3: Sources of Papers on Innovation and Student Engagement

Database	Number of Papers	Percentage (%)
DOAJ	4	16%
Google Scholar	9	36%
Scopus	5	20%
Web of Science	5	20%
ScienceDirect	2	8%
Total	25	100%

The analysis showed that innovation contributed through digital platforms, problem-based learning, and collaborative pedagogies that improved student creativity and engagement. For instance, Knox (2022) demonstrated that virtual learning environments increased entrepreneurial creativity and collaboration among students. Likewise, Lyu (2024) found that innovation-driven pedagogy improved opportunity

recognition and deepened learning engagement. Across the reviewed studies, innovative teaching methods were directly linked with improved problem-solving, critical thinking, and sustained interest in academic activities. This indicates that innovation acts as a catalyst that strengthens the effectiveness of entrepreneurship education in driving student growth.

Analysis of Research Question 3

What combined effect do entrepreneurial mindset and innovation have on students' growth and engagement?

Table 4: Sources of Papers on Combined Influence of Mindset and Innovation

Database	Number of Papers	Percentage (%)
DOAJ	3	12%
Google Scholar	10	40%
Scopus	6	24%
Web of Science	4	16%
ScienceDirect	2	8%
Total	25	100%

Findings indicated that the combination of entrepreneurial mindset and innovation generated the strongest outcomes in student growth and engagement. Liu et al. (2023) showed that entrepreneurship programs incorporating innovative pedagogies alongside mindset development improved competence and study engagement by up to 35%. Similarly, Malathi (2025) found that entrepreneurial education, when infused with innovation, significantly predicted students' entrepreneurial intention and sustained engagement. Collectively, the evidence revealed that mindset provides the internal drive while innovation supplies the external tools and methods, together producing synergistic effects on student growth and engagement.

Conclusion

This study demonstrates that entrepreneurial mindset and innovation are interdependent drivers of student growth and engagement in higher education. Entrepreneurial mindset fosters self-efficacy, resilience, and motivation, while innovation enhances creativity, problem-solving ability, and active learning participation. When combined, these attributes create a reinforcing effect that equips students with both the confidence and the practical skills needed to thrive in an increasingly dynamic and competitive environment. Beyond personal development, the findings highlight the broader significance of nurturing these qualities to produce graduates who can contribute meaningfully to national development and Nigeria's transition into a knowledge-driven economy.

Recommendations and Policy Implications

The study based on findings recommends with policy implications as follows:

- i. Curriculum Integration and Pedagogical Innovation: embed entrepreneurial mindset training in all academic programs and adopt innovative teaching methods (problem-based learning, digital collaboration, experiential projects).
- ii. Policy and Institutional Support: introduce entrepreneurship and innovation as core, compulsory modules and develop policies and incentives that encourage universities to implement effective frameworks.
- iii. Sustainability and Socio-Economic Impact: ensure adequate funding and monitoring mechanisms for continuity and promote job creation, self-reliance, and national socio-economic transformation through graduate empowerment.

Abstract

Virtual marketplace, web market or electronic marketplace is an ecommerce web site that engages buyers and sellers with a variety of products and service offerings. The increasing activities on these web market is the impact increase in working hours, convenience and logistic cost associated with mortal and stone marketplaces. Therefore, the need to create a web marketplace to suit specific requirements and preferences of Federal University of Petroleum Resources, Effurun FUPRE market environment. The idea for creating this web site is to enhance and leverage a unique and effective market hub for the university marketplace. The participants were selected from students and staff of the Federal University of Petroleum Resources, while data collected were sourced from observation, interview and questionnaire methods to obtain information about their needs, behaviour patterns, product and services they purchase. To analyse the data, waterfall technique was used while Technology Acceptance Model was the bases for better understanding of the model adoption. The result revealed that a customized web marketplace will position FUPRE to take advantage of ecommerce benefits to compete favourably in this digital age and standout among equals. This study therefore, recommends policy implantation at all institutional level to promote collaboration, resource sharing and digital inclusiveness.

Keywords: Academic Collaboration, Information Dissemination, Centralized Marketplace, University Community, Web Marketplace.

Introduction

Digital technology is transforming the education sector and in particular the university landscape due to global inclusiveness and paradigm shift brought about by the internet. These marketplace platforms go beyond business transaction but also has become a community involvement for knowledge sharing, collaboration and an information hub (Brown, 2020). This paper reflects how a unique university web market for Federal University of Petroleum Resources (FUPRE) can foster and engage positive academic sharing community relation. Besides, the 21st century students are becoming digital native relying on mobile devices to achieve academic excellency (Gomez & Martinez, 2019). Thus designing a customize web marketplace for students and staff that accounts user preferences and

behaviour needs will enhance users' engagement. Some prominent ecommerce web marketplace popular in Nigeria are Jumia, Konga and Jiji (Smith and Jones, 2018). These ecommerce giants have transformed virtual shopping in Nigeria and taking advantage of web marketing for personalised regional solutions (Brown & White, 2017). Other web markets such as PayPorte and DealDey focuses on niche segment for fashion, and a variety of products and services that are affordable at discounted prices (Gomez & Martinez, 2019).). These online markets enhance users satisfaction, technology usage and an increasing embrace of digital solutions for daily requirements. (Okofu et al., 2025a; Okofu et al., 2025b). At the Federal University of Petroleum Resources, Effurun, the creation of an online marketplace for the campus community is significant for

improving a number of facets of academic life. By creating a strong information center for the prompt distribution of announcements and scholarly materials, it tackles issues pertaining to information exchange. Below are examples of some various web marketplace:

Jumia: Often called the "Amazon of Africa," Jumia is influencing Nigeria's web marketplace. Electronic commerce in Nigeria and Africa has grown as a result of the company's dedication to catering to a variety of markets (Chimezie et al., 2025; Harris, 2025). Jumia founded in 2012, is a one shop to improve online marketing, offer variety of customer products at convenience with easy accessible transactional processes. Jumia has extended her offering by lunching JumiaPay, a cutting edge technology Harris, 2025.

Konga: Konga is an ecommerce marketplace that offers a complete house hold items, it has effective logistic system and customer satisfaction as a key priority which has positioned the web site positively in the minds of Nigeria. Konga equally incorporated various payment options encouraging ecommerce engagement in Nigeria (Ibam et al., 2018).

Jiji is a popular ecommerce site that has positioned and niched itself as a hub for new and second hand products from employment, services, real estate and many more. Jiji encourages buyers and sellers to participate in online transaction due to its easy navigation user interface and free classified ads. (Brown & White, 2017; Nuhu et al., 2023). This user centric environment encourages local transactions between buyers and sellers within certain proximity to negotiate and communicate before final payment (Nuhu et al., 2023).

Amazon: Amazon popularly known as The Everything Store is a multinational ecommerce known for her divest global goods and service offerings (Hansen, 2021).)

Alibaba: The Asian market is dominated by the Chinese e-commerce giant. Alibaba studies on the "Alibaba Effect" investigate how it impact on the inequality of geographical consumption (Wang et al., 2020).

eBay: eBay remains a pioneer in online auctions and sales, and a significant player in the consumer-to-consumer (C2C) marketplace. Economic insights from internet auctions are discussed in the literature (Chinedu, 2019).

Etsy: Etsy is well-known for its specialized emphasis on antique, handcrafted, and distinctive products. Sangeet Paul Choudary's book on "Platform Scale" examines its model in light of new business models (Choudary, 2015; Choudhury & Sabouri 2020).

Uber: Linking drivers and passengers worldwide, Uber is a prominent example of the sharing economy. A Harvard Business Review article discusses ride-hailing's platform business model (Eisenmann et al., 2016).

Airbnb: By offering a platform for short-term lodging, Airbnb has revolutionized the hospitality sector. Study like Zervas et al. (2017), explore how Airbnb affects the hotel sector.

Related Works

Web marketplaces have revolutionize ecommerce by connecting buyers and sellers in virtual spaces for the exchange of goods, services, and or information (Akazue, et al. 2024a; Okofu et al. (2024a). These platforms are distinguished by their varied product offers, that promote user-friendly interfaces and interactive features (Eisenmann et al., 2016; Johnson et al., 2020). Commission-based arrangements, subscription fees, and advertising revenue are some of the business models that support online markets growth in a volatile environment (Choudary, 2015; Choudhury & Sabouri, 2020; Ehiedu et al., 2020; Okofu et al., 2025; Parker et al., 2016). The marketplaces platform's sustainability and profitability are greatly impacted by the business model that is selected (Eisenmann et al., 2009), and web marketplace success frequently depends on network reliability, which determines the platform's value to rise as user participation increases (Hagiu & Wright, 2015; Ojugo et al., 2023).

In order to maintain growth, elements including user engagement, supply-demand balance, and marketplace dynamics are essential (Akazue et al., 2024b; Nuhu et al., 2023). Researchers have emphasis that the success of web marketplace depends on users trust, system reliability and acceptance (Ehiedu et al., 2021; Okofu et al., 2023; Okofu et al., 2024). Trust promotes system continuous usage and ecommerce growth (Akazue & Aaghaular, 2015; Okofu et al., 2025a). Despite positive impacts of web marketplaces, it encounters challenges such as fraud, data security and substandard product delivery (Akazue & Onyekweli, 2019; Ikem & Akazue, 2025; Ojugo et al., 2023). These web market issues arise due to its nature of globalization which have necessitated the establishment of international and national regulations to protect ecommerce buyers and merchant (Chang & Lee 2018).

Regardless of the issues in web marketing, factors as perceived benefits, easy navigation, promotes engagement and users experience (Okofu 2023; Okofu et al., 2025a; Okofu et al., 2018). However, the future of ecommerce is focus on augmented reality (AR) and decentralised financing (DeFi), with emphasis on design and implementation (Choudary, 2018; Lee & Lee, 2020). To leverage improve cooperation and resource sharing in the university marketplace. Zhang & Wang (2022), revealed that students active involvement showed better goal achievement and an added value to transactional activities. According to Diehl et al. (2022), web market design should focus on user friendly interface, implementation challenges and solutions and experiences. Hesham & Amer (2025), investigated design components and its effects on university marketplace to enhance user experiences and institutional productivity.

Manca & Ranieri (2022), researched on increasing a safe, interactive learning and scalable web marketplace to leverage learning, by ensuring reliable network connectivity, supportive infrastructure functionality specifically for campus users.

Notwithstanding, Lemon & Verhoef (2016), investigated significant roles of university community web marketplace in encouraging sustainability and positive student behaviour outcome. In yet another study by Alamri (2021), the researcher focused on the need for pedagogical and technical implications in web design platforms for academic students and staff performances. Zhang & Wang (2022) provide insights into the integration of online marketplaces in educational environments. Although the design components that contribute to platform effectiveness are mentioned in their work, a more thorough analysis is required to fully grasp the subtleties of these design features.

Harris (2025), examined machine learning language and data analytics functionality in university web marketplace and the result reveals its encourages users trust, community engagement, and users' satisfaction. From the works of Choudary (2015), on web marketplace architectural design, the study acknowledges that educational marketplace's architectural design enhances user interaction and facilitates productive teamwork.

Theoretical Review

Recent studies have paid more and more attention to the investigation of web marketplace design and implementation in university communities. Although there are not many studies that only address this

particular subject, a review of relevant literature identifies a number of research gaps and recommends topics for additional study and contribution to the scholarly conversation. The theory used for this study is Davis's (1989) Technology Acceptance Model (TAM), which specifically identified perceived utility (PU) and perceived ease of use (PEOU) as factors influencing technology adoption. The TAM model only suggests that a technology is accepted when it is used with less effort, is user-friendly/centric, easy navigation, and has a nice interface (PEOU), and enhances results through cooperation, knowledge, and resource sharing (PU). TAM also pointed out that elements like design can improve use. In order to influence inclusiveness, forecast behaviour, and explain theoretical implementation and explanation this study utilize five phases to accomplish behaviour acceptable for the web marketplace developed.

Research Method

This research uses the waterfall methodology and is organized into five stages. Data collection, analysis, design, execution, and assessment are some of the discrete stages that comprise this process. The complicated and constantly changing university marketplace serves as justification for this study, which aims to maximize involvement in a digital setting, as depicted in Figure 1.

Figure 1. Flowchart of the proposed system (Source: Okofu et al., 2025)

Data collection methods include questionnaires, interviews, and observation. Academic literature is often used to examine fundamental market design ideas. The creation of an online marketplace for the university community is a cutting-edge approach to a 21st-century learning environment that will enhance communication, solve problems, and advance staff and student knowledge. Through observation, interviews, and

questionnaires, the behaviour process of the respondents was directly monitored in order to get information about the needs of the products and how to meet them. On the other hand, questionnaires ask about purchasing and selling behaviors as well as online shopping habits. Staff members and students make up the responses.

Analysis: Analyzing data is the first step in creating a functional and nonfunctional specification for the

application that will be developed for the campus stalls. At the analysis stage, data was examined to generate system requirements.

Design: The stage of system design is where the intended campus stall application system items are designed. Menu design, use case diagrams, database design, and system interface design are among the tasks involved in this design. The functional and non-functional system specifications produced by the preceding activity (analytical Phase) serve as the foundation for this design activity.

Implementation: The process of turning the design into a program (coding) is known as the implementation phase. The campus stall application system is the end product of this endeavor.

Evaluation: The evaluation: process involves determining if the developed system can function effectively and satisfy user requirements. Black box and usability testing are used for evaluation in order to generate high-quality criteria.

Analysis Requirement

Systems analysis is the process of breaking down a whole information system into its constituent elements. Identifying and assessing issues and requirements to ensure that the system is designed to meet expectations. At this point, waterfall analysis was used to identify the marketplace system's functional and nonfunctional requirements for meeting the demands of the students.

Functional Requirement: This is the requirement that relates to the features and procedures of the campus marketplace system

The system has the ability to show member data and accept input data.

2. Members' dashboard menus and submenus can be managed by the system.

A. Backend: Admin/Service Provider Panel:

3. The technology is able to display ad categories and collect data.

4. The system is able to show advertising photo data and other information after receiving input.

5. The system can display a large number of images from certain advertisements after receiving input.

Tools and Equipment Used

i. Xampp: Apache: An open-source Java Servlet Container, Apache, also referred to as Server, was created by the Apache Software Foundation.

ii. MySQL server: Compared to earlier systems, it manages big databases considerably more quickly. In addition to a variety of client apps and libraries, administrative tools, and application programming interfaces (APIs), it includes a multithreaded SQL server suited for Internet database access due to its connectivity, speed, and security.

iii. HyperText Markup Language. The standard markup language for texts meant to be seen in a web browser is. It can be beneficial to employ technology like Cascading Style Sheets (CSS), which we also use to style the pages on our website. The creation of web applications gave rise to

iv PHP, or Hypertext Preprocessor, is a programming language that is executed in a specific order, starting with a PHP interpreter and then moving on to a web server module is combined by the web server.

v. JavaScript: The abbreviation JS stands for a computer language, combined with HTML and CSS to develop websites.

Conclusion and recommendations

The creation of an online marketplace for Nigerian university communities provides a customized answer to the unique requirements of higher education. The platform acts as a digital hub that promotes community involvement, resource sharing, and teamwork. The web marketplace is becoming a useful tool for improving convenience and connectivity in the academic setting as colleges continue to adopt digital solutions. The technical functionality of this work and the beneficial effects it has on the everyday lives of university personnel, faculty, and students are what determine its success. The model shows that, in contrast to the conventional classroom setting, users are more likely to collaborate, share resources, and exhibit active and constructive behaviour. In a marketplace of learning, purchasing, and selling, this model supports the waterfall technique to improve students' academic goals. According to the model, the five actions taken have a favorable impact on staff and student performance as well as communication abilities in the university marketplace.

Additionally, our model shows that consumers of cashless payments, new business model efforts, and virtual marketplace interaction have a greater influence. In order to thrive, sustain, save costs, and compete in this era of growing e-commerce, the study suggests that universities throughout the state and the nation adopt particular behaviours using digital marketplace models. Once more, policymakers are urged to promote digital inclusivity across all industries in order to close the disparity in technology, support cash-lite universities, and move toward the advantages of e-commerce, cloud computing, and customer focus. In order to meet user preferences and changing consumer behaviour patterns that impact university environmental needs for improved contextual e-commerce sustainability models, more research is advised to assess students and staff in other university environments. Furthermore, it could be argued that smaller institutions may surpass larger ones in the correct digital marketplace if the appropriate models were used to meet the needs of new consumers and take advantage of the competitive advantages that e-commerce marketplaces provide.

Abstract

Local government autonomy and fiscal decentralization continue to be central themes in Nigeria's governance and development debates. While the 1999 Constitution designates local governments as the third tier of government, their independence is often eroded by state-level interference, limited institutional capacity, and heavy reliance on statutory allocations from the federation account. The continued operation of the joint state local government account, alongside constrained revenue-generation powers, has rendered most council financially weak and unable to effectively fulfill their developmental mandates. This study explores the historical and structural factors that undermine local government autonomy, with particular attention to fiscal frameworks, political interference, and accountability gaps. It also assesses how restricted fiscal decentralization affects service delivery, grassroots participation, and sustainable development. The findings indicate that although decentralization is theoretically designed to enhance local governance, in practice, Nigeria's system has fostered dependency and inefficiency. To tackle these challenges, the study proposes several reforms. First, constitutional amendments are needed to secure the financial autonomy of local councils. Second, abolishing the Joint Account would grant local government councils full financial independence and political autonomy. It would also make them responsible for the efficient management of schools, healthcare, social services, rural development, and other local functions. However, each council must be accountable for every kobo spent. Statutory allocations from the Federation Account intended for local governments should be transferred directly to them in accordance with the Supreme Court ruling. Thirdly, the federal system comprises three tiers of government, each with distinct responsibilities and powers; therefore, the constitutional provisions defining these powers must be strictly respected by politicians and state actors as it will help to stamp out political interference at the local government. Citizens and civil society organizations should serve as vigilant watchdogs whenever sections of the constitution are violated by contemporary politicians, thereby promoting effective social accountability and governance. As a matter of fact, meaningful fiscal decentralization, supported by institutional reforms and active citizen participation, is essential for enabling local governments to exercise real autonomy. In the absence of these measures, local councils will remain structurally constrained, weakening Nigeria's overall democratic progress and development goals.

Keywords: Local Government, Local Government Autonomy, Fiscal Decentralization, Intergovernmental Relations, Revenue Allocation.

Introduction

Local government plays a pivotal role in the governance framework of contemporary states, functioning as the level of administration closest to the people. Its effectiveness, however, depends largely on the extent of its autonomy and the degree of fiscal powers devolved from the central government. Autonomy implies the ability of subnational entities to make independent decisions, formulate policies, and manage resources within the boundaries of national

legislation (Abadan, 2023). Fiscal decentralization refers to the delegation of financial authority including revenue generation, resource distribution, and expenditure responsibilities from central institutions to local governments. Together, these elements form the backbone of a meaningful decentralization agenda aimed at strengthening accountability, responsiveness, and efficient service delivery (Abdull, 2022).

The increasing emphasis on decentralization reforms in both developed and developing nations stems from the

realization that centralized systems frequently fail to meet the varied needs of local communities, particularly in socially, economically, and culturally diverse settings. Advocates contend that enhanced fiscal autonomy enables local governments to craft policies aligned with local priorities, optimize resource mobilization, and promote participatory governance (Abdull, 2022). In Nigeria, the local government functions as the third tier of governance, constitutionally mandated to promote grassroots development and ensure proximity to the people. Yet, its effectiveness remains a subject of debate, especially concerning the level of autonomy it possesses and the degree of fiscal decentralization granted within the federal structure (Abiola, 2021).

Although Nigeria's constitution acknowledges local government autonomy and provides for a decentralized fiscal framework, the reality shows considerable constraints. State governments' dominance over local government finances most notably through the State Joint Local Government Account (SJLGA) has greatly undermined the fiscal independence of local councils. Moreover, governance in Nigeria is becoming increasingly centralized in the hands of a small group of influential aides, often referred to as cabals, whose interests and objectives are typically narrow and identity-driven (Afonughe, 2021).

In addition, factors such as limited revenue generation, heavy reliance on statutory transfers from the federation account, poor financial management, and persistent political interference have weakened the effectiveness of local governments (Abubakar & Afolabi, 2022). These challenges call into question whether fiscal decentralization in Nigeria truly strengthens local councils or merely sustains their subordination within the federal system. This research explores the nexus between local government autonomy and fiscal decentralization in Nigeria, assessing their impact on governance, development, and the consolidation of democracy.

The Concept of Local Government

The concept of local government has been defined in numerous ways by scholars, but a few key perspectives are highlighted here. Broadly, local government is regarded as the third tier of governance, positioned closest to the people. It serves as the primary channel through which citizens access public services and actively engage in local decision-making. Appadorai (1975), provides an early definition of local government, describing it as a form of governance rooted in the will of the electorate or local groups, entrusted with administering affairs, delivering services, and addressing matters of concern to the people within a specific locality.

Abubakar and Afolabi (2022) describe local government as a constitutional and conventional political sub-unit of a nation, vested with a certain level of authority over local and communal affairs, including the power to levy taxes and mobilize labor for designated purposes. Similarly, Mtasigazya (2019) defines local government as a public authority comprising both elected and appointed officials who operate at the grassroots level to advance democracy and foster community economic development. In essence, governance responsibilities are delegated to local residents to be carried out at the community level.

Local Government Autonomy

Adebayo (2022), observes that the core of the debate on local government autonomy lies in determining the scope of authority and responsibilities that national, regional, or state governments should devolve to local political units. The 1976 local government reform in Nigeria, however, not only provided a formal definition of local government but also laid the foundational principles of local government autonomy. The 1976 reform characterized local government as administration conducted at the grassroots level through a representative council, legally constituted to exercise specific powers within defined territorial boundaries (Abadan, 2023).

These powers are intended to give local councils substantial control over community affairs, along with authority over personnel, institutions, and finances, enabling them to deliver services, initiate projects, and implement programs of both state and federal governments within their jurisdictions. By assigning such responsibilities to local councils and engaging community members and traditional institutions, effective management of local affairs can be better ensured (Adeyemi, 2023).

The definition above underscores the key elements of local government autonomy. First, a local government must possess a distinct legal identity separate from state and federal authorities. Second, it should hold defined powers and responsibilities that differentiate it from higher levels of government. Third, it must operate independently in carrying out its functions, apart from the control of national and state governments (Agba, 2018).

Thus, local government should not be treated as a subsidiary or extension of either the national or state governments. Fourth, it must have the power to enact its own laws, rules, and regulations. Fifth, local governments should possess the authority to formulate and implement their own policies, as well as the autonomy to recruit, promote, and discipline their staff independently, without requiring approval from higher levels of government (Agbo, 2019).

Agwor and Akani (2017), argue that local governments in Nigeria have never attained the degree of autonomy described in the foregoing definitions. As noted earlier, the extent of autonomy granted to local units is often shaped by state-level politics across different political systems. For example, in the United States, local government autonomy is grounded in core ideals and values such as liberty, equality, democracy, individualism, unity, and diversity (Ahamba, 2017).

These ideals shape the character of state politics and constitute a core part of the American national identity. As Aisha et al. (2025), rightly observe, they also influence how Americans perceive the world. Deeply embedded in the national consciousness, these enduring values have profoundly shaped the formulation of public policies and legislation in the United States.

Ajayi (2021), further emphasizes that liberty has always been central to American political culture, with the dominance of liberty-centered discourse serving as clear evidence of this tradition. The U.S. Constitution's preamble reinforces this through its reference to securing "the Blessings of Liberty to ourselves and our Posterity," echoing the broader ideals of "Life, Liberty, and the Pursuit of Happiness" and symbolically represented by the Statue of Liberty. These principles continue to shape federal, state, and local government relations in the United States.

Ajiboye (2021), observes that the principle of liberty strongly influences the scope of powers and responsibilities that federal or state governments delegate to local authorities. Since the American Revolution, the nation's governance has been shaped by this guiding ideal of liberty. However, it is important to note that in every political system, local governments operate with some degree of oversight and interference from higher levels of authority.

Akinwale (2021), argues that federal and state governments have multiple avenues to enhance the financial stability of local governments within an intergovernmental framework. In mature federations such as Switzerland and the United States, higher levels of government often intervene in local council affairs through grants-in-aid and other support programs, ensuring that local authorities are able to discharge their responsibilities to the people effectively. Akpomivie (2017), notes that local governments in the United States have gained from the supportive involvement of federal and state authorities. Because this form of interference is constructive, it has not generated significant conflict or controversy.

The core argument is that federal and state interference in local government affairs can produce both beneficial and harmful outcomes. When such interference obstructs a local government's ability to fulfill its legal responsibilities or when the reverse occurs it becomes

problematic. The former often triggers conflicts, court cases, and academic debate. While constructive interference can strengthen local governance, harmful interference deepens federalism-related tensions at the subnational level. In the Nigerian federation, negative forms of interference are more prevalent (Alabi & Okunade, 2021).

The Types and Workings of Autonomy

In Nigeria's federal system, the notion of autonomy for each federating unit is closely tied to the Niger Delta region's struggle for resource control during Olusegun Obasanjo's civilian administration. The local communities are regarded as having the right to manage both the natural and human resources within their respective local governments (Anayochukwu & Ani, 2021). Such a degree of autonomy is essential for every local government in Nigeria and is exemplified in a federal system like that of the United States. However, local government scholars hold differing views regarding both the nature and practice of autonomy in the Nigerian context.

Ayuba (2022), defines autonomy as the degree of freedom local governments possess in managing their own affairs. However, complete autonomy is impossible, as it would effectively transform them into independent sovereign states. Within a federal system, autonomy instead implies that each level of government exists distinctly and operates independently of the direct control of others (Cornelius, 2022). Autonomy is only meaningful if a government unit is not constitutionally bound to obey directives from another. In a federal system, each tier of government must therefore possess a measure of independence.

This reflects the hallmark of a genuine democratic state, which must operate fully in line with the guarantees of the national constitution. According to Mukoro (2013), such autonomy should enable the effective exercise of decision-making, revenue generation, financial management, personnel administration, and other administrative functions. Eze (2019), however, contends that the hasty implementation of fiscal policies has deepened inequalities in wealth, opportunity, and fairness among the federating units. Eze and Muanya (2021) argue that in mature democratic societies practicing federalism, a harmonious balance is achieved among the federal, state, and local tiers of government. These societies effectively share available resources to enable each tier to perform the responsibilities assigned to it by their respective constitutions.

Contextualization of Autonomy in Nigeria Local Government

With respect to local government, autonomy denotes the freedom to perform constitutionally assigned functions without interference from higher authorities, similar to the independence exercised by a self-governing community or group in specific areas such as religion or education. Webster's Comprehensive Dictionary of the English Language (2006), defines autonomy as self-determination or freedom of will, while Fagbadebo and Adebayo (2021) describe it as the ability to act and make decisions independently, free from external control.

The issue of autonomy in Nigeria's local government system is complicated by historical precedents, many of which stand in direct conflict with the constitutional provisions noted earlier. Autonomy enhances decision-making by reinforcing self-determination, which involves making independent choices that ultimately serve broader societal interests (Faguet, 2021).

Nigeria operates as a constitutional federal state, with authority at the federal, state, and local levels deriving from the constitution. Ibrahim (2020), defines federalism as a system comprising two or more levels of government such as the national and local tiers that function autonomously and in coordination, each exercising authority within its own jurisdiction.

Before independence, local government in Nigeria functioned merely as a second tier of administration. This situation changed with the 1976 local government reforms, an initiative later reinforced by the 1979 Constitution. Over time, successive constitutions of the Federal Republic of Nigeria have sought to strengthen the local government system. For instance, Section 7(a) of the 1999 Constitution explicitly grants local councils exclusive legislative authority.

Eze (2019), argues that since local councils possess their own legislative framework and share comparable powers with state and federal governments, achieving autonomy at this level should not be difficult. The 1999 Constitution of the Federal Republic of Nigeria, in Section 3(6), specifies the number of local government councils. However, the degree of autonomy at this tier has been curtailed, particularly after the federal government invalidated attempts by several state governors to increase the number of councils in their states under a democratic regime.

Mukoro (2013), rightly contends that what the constitution guarantees is the system of local government, not the specific number of councils. Under Sections 8(3) and 8(5) of the 1999 Constitution of the Federal Republic of Nigeria, the creation of any local government council requires prior approval from the State House of Assembly, while the National Assembly retains the constitutional authority to ratify such a request.

In addition, the constitution empowers the government to determine the location of each council's local government offices. Section 8 explicitly requires every state government to comply with its provisions, which guarantee local governance through democratically elected councils. It further mandates the enactment of laws regulating their creation, structure, composition, funding, and functions (Faguet, 2021).

Section 8 of the constitution makes it clear that neither the state nor the federal government holds exclusive authority to establish local governments. In this regard, Adeyemo (2005), citing Omoruyi (1991), argues that earlier government reports on reforms failed to provide sufficient conceptual clarity on the actual extent of autonomy guaranteed by the constitution. Building on this debate, Ayuba (2022), laments the absence of genuine functional autonomy in the system, attributing this shortfall to both statutory and constitutional constraints.

Nigeria Health Watch (2023) observes that, since the colonial era, local government has never functioned as a truly distinct tier of government separate from the state and federal levels, but has instead remained subject to their control. Adeyemo (2005) similarly contends that genuine autonomy may be unattainable, since the existence of two sovereign authorities within a single state would create a counterproductive model of governance.

Noah (2017), argues that granting absolute independence to local governments would create a complex situation that could ultimately lead to systemic breakdown. He stresses that autonomy does not mean total freedom from state and federal oversight, but rather a balanced degree of independence that enables local governments to operate in line with constitutional and legal provisions.

Nwosu (2023), contends that the problem of autonomy is rooted in colonial legacies, which concentrated the nation's political, administrative, and supporting structures in the hands of a privileged few. This legacy, he argues, has fostered military elitism, thereby undermining the rule of law, accountability, and transparency in the evolution of local government.

The Nigerian political and economic elite have historically treated local governments as subordinates or mere extensions of state bureaucracies, a practice that has contributed to the current weakened state of local government autonomy. Jovanovich and Ogunleye (2021), in their comparison of local government autonomy in Nigeria and the United States, note that the 1976 reforms and the 1979 Constitution of the Federal Republic of Nigeria provided sufficient legal backing for local councils to operate independently, much like the states and the federal government, which also derive their authority from the constitution. Serving two masters at the same time is almost

impossible in practice, as it undermines organizational ethics and hinders effective communication.

Mard (2022), argues that the challenges of local government autonomy stem from the legal framework regulating them, which he describes as derivative in nature and constitutionally structured in ways that restrict councils from fully serving their local populations. He notes that these laws originate from three sources the Federal Constitution of Nigeria, periodically enacted state laws, and local government bylaws designed to promote good governance leaving local governments subject to the authority of all three.

According to Adeyemo (2005), local government autonomy within a federal system implies that each level of government operates independently, without interference from the others. However, this notion seems to create contradictions that hinder the practical realization of true autonomy. It is also important to note that this perspective overlooks the present reality, where the federal structure integrates all tiers of government and further complicates constitutional implementation.

This constitutional provision reflects the problematic practice, initiated by many state governors, of periodically removing elected local government officials from office and assuming control over their responsibilities. Despite this, local government autonomy remains highly significant for grassroots politics in Nigeria, particularly within the current democratic framework that seeks to reinforce national politics and foster integration.

Building on Jovanovich and Ogunleye (2021), autonomy at this level of government is meaningful only when local governments are not constitutionally required to follow directives from higher tiers. They define autonomy as the extent of discretion and independence local governments possess from state and federal interference, which can enhance the effectiveness of council management.

Local Government Autonomy in Nigeria

Various initiatives have been undertaken to reform local governments with the aim of promoting the socio-economic development of rural communities. The ongoing existence of local governments has made the question of autonomy increasingly prominent (Obisanya & Hassan, 2022). Consequently, the Nigerian local government system has experienced several reforms designed to strengthen its functionality and authority (Wilson, 2013).

Among various reforms, the 1976 local government reforms represented a pivotal moment in the administration of local governments within Nigeria's democratic framework. These reforms led to the establishment of 774 legally recognized local governments, with the main objective of bringing

governance closer to the people and enhancing the development of rural communities and their residents. Mard (2022), notes that the adoption of the Dansuki Report in 1984, aimed at addressing issues related to the financial and administrative independence of local governments, marked the start of local government autonomy in Nigeria. Since then, scholars have examined local government from multiple perspectives. Ogunyemi and Adegoke (2021), define local government autonomy as the degree of independence, authority, and control a local government can exercise in managing its affairs without interference from state or federal authorities. This perspective emphasizes local government autonomy in terms of the freedom to make and implement decisions regarding its own operations. According to Jamo (2018), local government autonomy refers to the freedom of a local government to exercise its authority within the limits set by the law or constitution. Ojo and Akinwunmi (2022), however, argue that the very law or constitution intended to grant local governments autonomy actually restricts them, effectively denying them true independence.

Section 7(6) of the 1999 Constitution, which grants the State House of Assembly the power to legislate on the administrative policies and operations of local government areas, highlights a gap that has contributed to the ineffectiveness of Nigeria's local government system. Furthermore, Section 162 allows state governments to operate through the State and Local Government Joint Account and Allocation Committee (JAAC), thereby undermining the financial and administrative autonomy of local governments.

However, the National Assembly has repeatedly failed to amend the relevant sections of the 1999 Constitution to enhance local government autonomy (Wilson & Sakiemi, 2019). Consequently, local governments have struggled to mobilize resources for the socio-economic development of rural communities. Based on this, Ogunyemi and Adegoke (2021) regard financial autonomy as the cornerstone of local government independence in Nigeria.

They further noted that the federal government increased its financial contributions to local governments from 10% in 1986 to 15% in 1992, and 20.60% in 2008 to the present in an effort to enhance their financial independence. However, this argument is limited, as it overlooks the significance of other forms of autonomy, including administrative, political, and legal, in promoting rural development.

From another perspective, Olawuyi (2020), contends that various local government reforms including the 1976 reforms and the provisions of the 1979, 1989, and 1999 constitutions were designed to provide Nigerian local governments with the autonomy needed for effective operation. However, due to the conflicting

constitutional provisions, local governments remain constrained, making the pursuit of genuine autonomy largely ineffective and unproductive.

Scholars such as Oloyede and Adeniran (2023), have echoed the shortcomings of local government reforms, arguing that the various reforms and constitutional provisions have been insufficient to secure effective local government autonomy in Nigeria. Local governments continue to face undue interference from other tiers of government, leading to administrative, political, and financial challenges.

The aforementioned claims were supported by Oluwatayo & Akanbi (2021), who asserted that local governments continue to lack practical autonomy despite the efforts made by the previous administration. According to President Buhari Muhammadu, the inability of local governments to operate autonomously creates the possibility for unwarranted state government interference in local government affairs, which results in inadequate local government performance in rural development in Nigeria (Jamo, 2018). In conclusion, local government autonomy must be protected if local government in Nigeria is to be effective in the development of rural communities.

Notwithstanding, In July 11, 2024, there was a landmark judgment by the Supreme Court of Nigeria which held that it is unconstitutional for state governments to intercept or withhold funds allocated to local government councils. The court, in a decision delivered by Justice Emmanuel Agim, emphasized that Section 162(3) of the 1999 Constitution affirming the financial autonomy and independence of the 774 Local Government Areas (LGAs) (Kingsley, 2024).

The Supreme Court's ruling affirmed that local governments have the right to receive their allocations directly from the Federation Account, thereby reinforcing the principles of local government autonomy, fiscal decentralization, and grassroots governance (Abadan, 2023). The federal government's renewed emphasis on local government autonomy arises amid widespread concerns regarding the management of local government funds by certain state governments, with reports alleging misappropriation of allocations and the consequent undermining of service delivery at the grassroots level.

Prior to this landmark ruling, states and local government areas operated a joint account under Section 162(6) of the 1999 Constitution, with states managing funds on behalf of local governments, awarding contracts without their input, and overseeing payments. This arrangement frequently resulted in inefficiencies, delayed salaries for local government staff, and neglect of essential services such as healthcare, roads, electricity, potable water, security, and education (Abubakar & Afolabi, 2022). These challenges have severely undermined good governance

and best practices, highlighting the urgent need for corrective measures.

Following this historic judgment, it is now unconstitutional for any state government to receive, withhold, or spend funds designated for local government areas. The learned jurist affirmed this ruling, ensuring the independence of local government administration in Nigeria. Henceforth, local governments will receive their allocations directly from the Federation Account, with each of the 774 local government accounts jointly signed by the local government chairman and the director of administration and finance, thereby guaranteeing financial autonomy (Ajim, 2024).

Following the landmark judgment, the federal government directed all 36 states to establish and operate dedicated bank accounts with the Central Bank of Nigeria (CBN) for each of their 774 local government areas. This measure aligns with ongoing efforts to implement full local government autonomy at the grassroots level and promote fiscal decentralization in Nigeria (Kingsley, 2024).

Despite the importance of the landmark judgment, its implementation has encountered significant challenges. Even a year later, state governors continue to control the allocation of funds intended for local governments. Additionally, with governors overseeing local government elections, councils remain firmly under their influence, making true autonomy and fiscal decentralization largely unattainable (Akinwale, 2021).

The Concept of Fiscal Decentralization

Fiscal decentralization refers to the transfer of fiscal powers such as revenue collection and expenditure decisions from the central government to lower-level subnational governments. Its goal is to enhance public sector efficiency, ensure greater responsiveness to local needs, and improve transparency in service delivery. Fiscal decentralization rests on key pillars, including expenditure assignment, which defines the functions and responsibilities of subnational governments, and revenue assignment, which determines their authority to generate funds and manage intergovernmental transfers (Rondinelli et al., 2018).

The flow of financial resources from the central to local levels is intended to promote equity and fund local services. As previously noted, local government autonomy entails granting local governments the independence to manage their internal affairs. In Nigeria, however, local governments cannot effectively exercise this autonomy if revenues are not properly decentralized to reach the grassroots level (Agbo, 2019).

Key Features of Fiscal Decentralization and Local Government Autonomy

• Nature of Transfers

These are financial transfers from a higher level of government to a lower one, made without any direct exchange of goods or services. At this level, local governments receive funds that are legally mandated and due to them according to established norms. The primary purpose is to empower local governments in the practice of governance (The White House, 2024). These transfers are intended to support local public spending, allowing local governments to deliver essential services such as infrastructure, education, and healthcare. By doing so, they help bridge governance gaps, with their benefits directly impacting the residents of the local jurisdiction.

• Expenditure Assignment

Expenditure assignment specifies which spending responsibilities are delegated to local governments, including services such as infrastructure, healthcare, and education areas often best managed at the local level due to regional needs. It promotes prudent use of funds and ensures that local resources are allocated effectively, emphasizing careful planning over wastefulness or self-interest in governance (Aisha et al, 2025).

• Revenue Assignment

Revenue assignment identifies the sources of funds available to subnational governments, including local taxes, user fees, and shared national taxes. This arrangement ensures that revenue generation is coordinated across federal (Obisanya & Hassan, 2022).

• Intergovernmental Transfers

Intergovernmental transfers are financial allocations from central to subnational governments within a decentralized fiscal system, allowing local governments to fund services such as education and policing despite differences in revenue-generating capacity. These transfers are a key component of fiscal decentralization and can be either unconditional (discretionary), providing local governments with flexibility, or conditional (earmarked), designated for specific purposes to ensure both equity and the funding of essential services (Adeyemo, 2005).

Roles in Local Government Autonomy and Fiscal Decentralization in Nigeria

Fiscal decentralization in Nigeria aims to strengthen local governments by granting them:

Reduce Disparities

Fiscal decentralization can address imbalances in local revenue-generating capacity, ensuring that all

subnational governments can provide a satisfactory level of services regardless of their economic base. In Nigeria, it would enable local governments to function effectively, generate their own resources, and promote development within their communities (Rondinelli et al., 2018).

Support Local Responsiveness

Fiscal decentralization allows local authorities, who have a better understanding of community needs and priorities, to allocate resources more efficiently for public services. For example, transfers from the national government to regional or local governments can support policing, education, and other critical local development initiatives. In Nigeria, this system can help address ongoing security challenges, as local governments and communities are more familiar with terrains and forested areas that often serve as criminal hideouts. By leveraging local knowledge, fiscal decentralization enhances intelligence gathering and strengthens public safety (Abadan, 2023).

Goals of Local Government Autonomy and Fiscal Decentralization in Nigeria

The essence of local government autonomy and fiscal decentralization is aimed at ensuring the following:

Improved Service Delivery

The primary purpose of the local government system is to bring governance closer to the people. Achieving this goal requires empowering local governments to deliver services that reflect the specific needs and preferences of their communities. Having government operate at the local level fosters human and infrastructural development and encourages active citizen participation. Addressing the developmental needs of rural populations ensures they share similar benefits with urban residents within the state (Yahaya, 2019).

Increased Efficiency

Local governments, with their detailed knowledge of local conditions, are better positioned to allocate resources efficiently. Being the tier of government closest to the community, they have first-hand insight into societal needs, enabling a bottom-up (Uzochukwu, 2023).

Enhanced Accountability and Transparency

In Nigeria, local governments can enhance accountability to their constituents by gaining direct control over service delivery and revenue generation. This transparency enables community members to track the monthly inflow of funds into their local government and monitor how these resources are managed and utilized (Wale, 2022).

Greater Political Stability

In some contexts, decentralization can promote political stability and reinforce nationhood. Stability

arises when societal needs are met and citizens are actively involved in governance. By enabling citizens to achieve their goals, decentralization fosters patriotism and loyalty to the state, contributing to effective nation-building (Watts, 2008).

Merits of Local Government Autonomy and Fiscal Decentralization in Nigeria

Responsive and Inclusive Governance

When properly implemented and monitored, financial decentralization and local government autonomy can create governance structures that encourage good governance and drive national development. As the third tier of government in Nigeria, local governments would be able to perform effectively, rather than remaining, under the current system, susceptible to corruption and undue control by state governments (Yahaya, 2019).

- **Transparency and Accountability**

It promotes transparency and accountability in addressing grassroots needs, reinforces democratic principles, and strengthens public trust. Local government autonomy and fiscal decentralization facilitate local participation in decision-making, planning, and implementation, fostering an environment of openness and accountability at the local level. Consequently, empowering local governments is a critical step in Nigeria's fight against corruption (Yahaya & Eze, 2022).

- **Civic Engagement**

It fosters participatory governance by encouraging civic engagement and responsibility. In a democratic system, active citizen involvement supports societal growth, progress, and development, contributing to a stable and smoothly functioning government. Local government serves as the foundational platform for reflecting local interests, activities, and aspirations, creating a balanced system that ensures people are actively involved in governance (Wale, 2022).

- **Efficient Resource Allocation**

Local government autonomy and fiscal decentralization enhance efficient resource allocation by reducing waste through closer oversight. Financially independent local councils can prioritize local projects and development in Nigeria, helping to prevent misappropriation as resources are used to meet the specific needs of the community. In this way, the principles of public choice theory are effectively applied (Yahaya, 2019).

- **Self-sufficiency**

It fosters self-sufficiency and financial autonomy at the grassroots level, thereby strengthening local economies. No nation can achieve meaningful progress without good governance, which entails the integration of local autonomy and fiscal management across federal, state, and local levels. When leaders uphold the principles of good governance, it generates positive outcomes for

national development. It is a collective responsibility to demand accountability, and implementing fiscal decentralization at the local government level in Nigeria is essential for achieving this success (Aisha et al., 2025).

Challenges of Local Government Autonomy and Fiscal Decentralization in Nigeria

The challenges facing local government autonomy and fiscal decentralization in Nigeria are multifaceted, encompassing legal, political, economic, and institutional aspects. The key challenges can be summarized as follows:

- **Finance**

Despite the increase in total funds available to local governments in Nigeria since the early 1990s including a substantial 80% financial contribution from the federal government in 1999 aimed primarily at addressing rural needs their economic and financial capacity remains weak relative to the development programs they are expected to implement (Ajayi, 2021). The misuse and misappropriation of funds by local councils is closely tied to the existing system. Through the State Joint Local Government Account mechanism, state governments legally mandated to fund local councils have instead exploited this arrangement to keep local governments' hostage, effectively reducing them to extensions of the state (Cornelius, 2022).

- **Constitutional and Legal Constraints**

State governments continue to act as intermediaries in transferring funds from the Federation Account to local government areas. Despite the Supreme Court ruling, the National Assembly has yet to amend the constitutional provisions supporting the State Joint Local Government Account. As a result, the implementation of the judgment remains largely incomplete (Ibrahim, 2020). In reality, both federal and state institutions seem to lack the political will to enforce the Supreme Court's judgment effectively. Furthermore, the Local Government Service Commission (LGSC), though not constitutionally mandated under the 1999 Constitution, has contributed to the further marginalization of local governments, making its influence a critical factor to consider (Abdull, 2022).

- **Political Interference**

State interference in local governments, as noted by Agbo (2019), often manifests in hiring practices driven by personal and parochial interests, leading to issues of redundancy. Nigeria Health Watch (2023), observes that when administrative institutions become politicized, corruption is more likely, and key positions are filled based on subjective or personal interests rather than merit. Faguet (2021), further defines this interference as the influence exerted by politicians or higher tiers of government on local administration,

manipulating internal affairs to undermine the effectiveness of the system.

According to Ajayi (2021), it is evident that local governments in Nigeria face varying levels of interference from politicians, state governments, and other political actors. This occurs when politicians dominate decision-making processes related to staffing, planning, organizing, directing, coordinating, and reporting including activities such as planning and budgeting within the public administration sphere (Aisha et al., 2025).

Conclusion

The quest for local government autonomy and fiscal decentralization in Nigeria is crucial for advancing democratic governance and fostering inclusive development. Although the constitution recognizes local governments as the third tier of government, their effectiveness is frequently compromised by excessive state control, limited fiscal capacity, and political interference. These limitations have hindered local governments' ability to address the specific developmental needs of their communities. Enhancing fiscal decentralization through clearer revenue allocation frameworks, improved internally generated revenue systems, and accountable intergovernmental transfers would enable local governments to play a more significant role in service delivery. However, autonomy must be coupled with strong oversight mechanisms to ensure transparency, prevent mismanagement, and encourage citizen participation in governance.

Ultimately, a truly decentralized system in which local governments possess both fiscal independence and institutional autonomy could improve governance efficiency, foster grassroots participation, and accelerate socio-economic development throughout Nigeria. Achieving this goal requires not only constitutional and legal reforms but also a sustained political commitment to align the federal system with the principle of genuine subsidiarity.

The debate on local government autonomy and fiscal decentralization in Nigeria highlights the ongoing tension between constitutional provisions and political practice. Although the 1999 Constitution formally recognizes local governments as the third tier of government, their autonomy is still significantly constrained by state interference, particularly through joint account mechanisms and state oversight of local fiscal operations. This structural imbalance has created a paradox: while local governments are expected to drive grassroots development, their ability to fulfill this role is consistently limited by systemic constraints.

From a theoretical standpoint, fiscal federalism posits that decentralization improves allocative efficiency, accountability, and responsiveness by bringing

government closer to the people. However, Nigeria's experience highlights the difficulties of realizing these benefits in a context characterized by elite capture, weak institutions, and widespread rent-seeking. Evidence from comparative federal systems shows that when local autonomy is paired with effective fiscal decentralization and strong accountability mechanisms, it can encourage innovation and enhance service delivery. In Nigeria, however, decentralization has often been "decentralization in form but centralization in practice."

The future of local governance in Nigeria depends on aligning constitutional guarantees of autonomy with institutional reforms that protect local councils from state interference while promoting fiscal discipline. Improving intergovernmental transfers, diversifying local revenue streams, and institutionalizing participatory budgeting can strengthen both fiscal capacity and democratic legitimacy. Ultimately, achieving sustainable development at the grassroots level requires not only legal and fiscal reforms but also a shift in political culture toward genuine subsidiarity and citizen-centered governance.

Recommendations

- A constitutional review that ensures clearly defined local government autonomy and fiscal decentralization is essential. To fully realize the principles of democratic federalism and give concrete effect to the concept of three-tier federalism, local governments should be explicitly and unambiguously recognized in the general provisions of Chapter I, Part I, Sub-section 2 of the 1999 Constitution of the Federal Republic of Nigeria. Accordingly, local governments should be empowered to generate independent revenue through enhanced taxation and intergovernmental transfers.
- Abolishing the Joint Account would grant local government councils full financial independence and political autonomy. It would also make them responsible for the efficient management of schools, healthcare, social services, rural development, and other local functions. However, each council must be accountable for every kobo spent. Statutory allocations from the Federation Account intended for local governments should be transferred directly to them in accordance with the Supreme Court ruling.
- The federal system comprises three tiers of government, each with distinct responsibilities and powers; therefore, the constitutional provisions defining these powers must be strictly respected by politicians and state actors as it will help to stamp

out political interference at the local government. Citizens and civil society organizations should serve as vigilant watchdogs whenever sections of the constitution are violated by contemporary politicians, thereby promoting effective social accountability and governance.

Abstract

This study examined the connection between corporate ownership and the valuation of companies listed on the Nigeria Exchange Group, with a focus on Tobin's Q. The independent variables included block institutional ownership, first largest ownership, block family ownership, and block government ownership. Data from ten years (2013 to 2022) was analysed using fixed-effect regression models, correlation analysis, and descriptive statistics on STATA 13. The results revealed that block government ownership has negative effect on firm value, while block institutional ownership and first largest ownership were positively associated with firm value. In contrast, block family ownership did not show a significant impact on firm value. The findings suggested that the corporate ownership, especially institutional and first largest ownership, can enhance firm performance by addressing agency issues and aligning managerial incentives with shareholder interests. Moreover, excessive government ownership appeared to impede firm performance due to potential political interference and inefficiencies. This study contributes to the ongoing discussion on ownership structure's role in corporate governance and firm value, offering valuable insights for policymakers, investors, and corporate managers in emerging markets. The implications highlight the importance of diversified ownership for sustainable firm performance and the improvement of monitoring and control mechanisms.

Keywords: *Corporate Ownership, Block, Institution, Family, Government, Tobin's Q*

Introduction

Despite the numerous studies worldwide, the connection between ownership structure and firm performance is unresolved. Drawing significant interest from corporate governance, Ibekwe (2021), opined that the separation of ownership and control enables managers to pursue objectives that may conflict with other stakeholders, potentially leading to losses. Ownership structures are influenced by well-developed capital markets with high liquidity and corporate philosophies aimed at maximizing shareholder wealth (Herrigel, 2008). Cheng and Wang (2021) argued that there is usually an agency problems in corporate governance especially where corporate ownership is diffuse. This mitigates the principal-agent dilemma by raising the cost of managerial actions and in the long-run jeopardized the firm's existence. Gilson, and Milhaupt (2022) observed that one of the ways of resolving this agency conflict is through institutional monitoring mechanisms, which would reduce any negative impact of expenses overindulgence on the firm's value.

The structure of a company significantly affects its performance. Mehboob, Tahir, and Hussain, (2015) argued that whether a firm is institutionally concentrated or family concentrated, ownership patterns plays a crucial role in determining the business environment. Furthermore, ownership influences how managers behave and the benefits received by important stakeholders (Ahmed, Ali-Shah, & Bhatti, 2020). Herein, these ownership variables as tied to block institutional ownership, first largest ownership, block family ownership, and block government ownership on a firm's value. Few studies found a positive relationship between ownership concentration and firm value. Conceivably, some studies suggests that family-owned businesses tend to do well, while firms with high levels of managerial ownership may struggle to find success. Others opined that a high level of divorce of ownership concentration reduces the managerial incentive arrangement, and thus a negative relationship. This further buttressed that a high level of ownership concentration will only strengthen the manager's insider control motive and discourage the use of resources, impose high agency costs, and lead to

sub-optimal valuation of firms. Okolo, Irem, and Ugwuoke, (2019) argued that either Management, staff and society as a whole does not know much about value for money audit and how efficient it is in fraud controls and misuse

The types of ownership concentration generally depicts the relative equity stake of different groups influencing the management of the company with the interest of such a group being paramount (Osterwalder, Pigneur, Smith & Etienne, 2020). Ogbada, Useh, and Udoanyang (2021) divided ownership structure into two categories: ownership concentration, which is made up of the share percent of the top five owners, and ownership structure, which is made up of the share percent of the state, legal or institution, and domestic individual holders. As a prerequisite to the role of control, it is commonly agreed that family-owned firms usually have some long-run goals which could have a significant impact on the value of the firm. Camisón-Zornoza, Forés-Julián, Puig-Denia, and Camisón-Haba (2020), argued that the participation of family members can impact the performance and three specific frameworks that support the authority to make decisions and control capacity in family businesses are the financial structure, the leadership and operational structure of the company, and the governance system of the family itself. Contrarily, a country with weak legal protection, higher transparency and dividend payment can thus enhance the firm's ability to cope, particularly concerning political and institutional pressures, and can reduce the tunneling interest within family firms (Sadler-Smith & Cojuharenco, 2021).

Government interest in a firm either economic or financial is a general practice that extends to the corporate sector. According to Oyejide and Soyibo (2001), ownership interest of government presence in quoted firms are noticeable in sectors like Building Materials (15%), Insurance (15%), Petroleum Marketing (17%), Banking and Finance (21%), Automobile and Tyre (30%) and Agriculture (32%), with some arrayed for privatisation through Public-private partnership. The extent of government ownership regardless of the level of control has strong implications.

The level of control involves participation of the board of directors, influence on technical or economic goals, or influence in appointing and removing the managers of the firm. The government may thus become a co-investor and sponsor of equity investments. It may provide the firms an opportunities to invest in additional resources, access to new markets and new public and private contracts. Nsoke, Okolo, and Ofoegbu, (2021) noted that as a matter of urgency in Nigeria, the government made it as a must for all registered enterprises to undergo mandatory skills

acquisition training before accessing credits and other associated benefits from the government.

The debate between government (public) and non-government (private) organizations has left many questions unanswered (Darnihamedani & Terjesen, 2022; Nwachukwu, & Nwoha, 2023). Sun, Tong and Tong (2002) noted that without government involvement, organizations may miss out on the political support and business connections that can greatly impact their performance. These connections and support are crucial for organizations to thrive. Smith, (2020); Al-Issa, (2021) and Hassanein, Marzouk, and Azzam, (2022) pointed out the problem of associated with government ownership, arguing that politicians may prioritize gaining profit over efficiency and use the money to suppress opposition from their supporters.

On the other hand, critics argue that government control over investment, supervision, and compensation, as well as the possibility of political punishment, allows the state to provide an alternative form of services through ownership and thereby transferring firm's resources (Singh & Chen, 2018). Jensen and Meckling (1976) maintained that when shareholders and management attends a publicly traded corporation, there are conflicts of interest that favour the allocation of resources of the enterprise's consumable assets rather than the desired assets. The asymmetric risk, differing investment opportunities or cash flow schedules of the firm, and differences in taxes depend on the rationality of the particular ownership structure, which can be particularly prevalent in firms with block ownership (Camisón-Zornoza, *et al.*, 2020 & Schmalz, 2021). According to Schillemans and Bjurström (2020), expected relationship between block government ownership and firm value and the appropriate choice of the corporate governance mechanism depends on the main theory of corporate governance, namely the agency theory.

This bridges a potential conflict of interest arising among these groups. Trisnadewi and Amlayasa (2020) and Din, Arshad-Khan, Khan, and Khan (2022) maintained that corporate ownership does not only defines the control and residual rights, but it also gives the owner a right to profits in the form of dividend income and an increase in the value of shares. Undoubtedly, corporate ownership also influences the firm's strategy behaviour and overall firm performance. Battilana, Obloj, Pache, and Sengul (2022) noted that most times, the attention of shareholders is shifted to the maximization of wealth through effective and efficient operations. These goals may, as a result, be in conflicts due to agency problems. The firm's performance is largely judged in terms of its financial and stock performance. This arises because dividend income can directly accrue to the shareholders, while

an increase in stock values constitutes a capital appreciation for the shareholders. In the Nigerian capital market, institutional ownership has been considered to have some positive influences on firm value (Ogabo, Ogar, & Nuipoko, 2021). According to Sinebe and Jeroh (2023), institutional investors affect the entire functioning of relevant financial markets to the extent that listed firms are also involved in the short and long-run because institutional concentration have influence on corporate decision-making processes. The distinction between gains for large institutional shareholders for the cost of a takeover may be of far less relevance in Nigeria than the control benefits offered by many publicly quoted firms. Chen, Liu, and Yan (2021), argued that in China, the huge presences of institution investors revolve around funds and insurance and holds more than 31% of the total value of listed companies.

Family-owned businesses are businesses controlled by members of the family and firms have many features in common with other firms. Corporate governance issues are central in the separation of managerial efforts from corporate control and are usually not associated with family-owned and managed businesses. The difference in the objectives of family-owned businesses and professionally managed firms is usually not given recognition (Buchanan, Martikainen, & Nikkinen, 2023). Family firms tend to prioritize long-term sustainability and generational wealth, while professionally managed firms focus on short-term profitability. Furthermore, family-owned firms often have a strong sense of loyalty and commitment to their employees and local communities. This can result in higher employee satisfaction and retention rates, contributing to the overall success of the firm (Biel & Ślusarczyk, 2022).

In contrast, non-family firms may prioritize short-term financial gains over long-term sustainability (Castellaro, 2023). Despite the differences, agency problems are present and ordinarily should not be seen as more prevalent in family-owned firms. However, researches have shown that family-owned firms may have unique ways of addressing these agency problems. The block family ownership variable has an important relationship with mechanism ownership structures that receive less attention. It gives families, whose direct holdings are relatively small, significant influence over the firm (Arteaga & Escribá-Esteve 2021). Because strong family ties exist. A family with a small block holding and a small pay package will have greater influence and control over a firm than an executive manager with large shareholdings and pay packages.

Review of Related Literature

Ogbada, et al. (2021) conducted a study on the connection between ownership structure and corporate

performance of 15 companies listed on the Nigerian Stock Exchange from 2016 to 2020. The study utilized an ex-post facto research design and discovered that the share of the largest shareholder ratio did not have a statistically significant impact on Tobin Q. Therefore, it was suggested that companies in Nigeria should consider adopting a diffused ownership structure rather than a concentrated one. Additionally, it was highlighted that firms with highly concentrated ownership are often challenging to monitor and control. The investigation of corporate governance as a potential predictor of financial statement fraud among listed Nigerian non-financial enterprises was conducted by Sinebe, et al. (2023). It looked at secondary data from 2012 to 2021; a period of ten years. Using an ex-post facto research approach, the findings showed that institutional ownership had no discernible impact on the financial statement fraud committed by listed non-financial companies in Nigeria. The study recommended that rather than putting too much attention on the structure, future revisions to the current governance standards for Nigerian firms should concentrate more on creating a comprehensive strategy to prevent financial statement fraud.

The impact of insider ownership on stock price synchrony was investigated by Cheng, *et al.* (2021). The management entrenchment effect predominates in nations where investor protection is inadequate, according to the study. Increasing ownership is accompanied by an increasing rate of synchronization. The management entrenchment impact, however, only becomes more significant than the incentive alignment effect in nations with robust investor protections when controlling ownership first rises. A more transparent firm results from the incentive alignment effect becoming greater and the net effect being reversed as controlling ownership increases.

Biel, et al. (2022) assessed the degree to which specific management techniques and instruments are employed in Polish family enterprises and investigated their influence on the efficiency of accomplishing different goals. 182 managers of Polish family firms participated in a survey regarding the efficiency of goal attainment and the tools and techniques employed in management. According to the study's findings, all three groups show that using these strategies has a limited impact on how successfully the objectives are completed. Enhancing family business managers' understanding of professional management techniques and resources is another fundamental goal of the larger family business environment.

Camisón-Zornoza et al. (2020) examined the asymmetric effects of family engagement on dynamic skills using a sample of 748 family-run businesses from the Spanish tourism sector. The result shown that a tightly controlled ownership structure with a sizable

amount of family money is invested in the business has unfavorable effects. From the findings, it asserted that the board of directors are not important structural components. The presence of an efficient family board and the use of family management tools is the most potent structural element that promotes the growth of innovation capabilities. These safeguards aid in lessening the detrimental consequences of an ownership and management structure controlled by a family.

Buchanan and colleagues (2023) conducted a study on how family competitiveness and owner engagement impact the performance of small and medium-sized enterprises (SMEs). They used random sampling to choose 1,137 Finnish SMEs that were not listed. The results of the study showed that businesses managed and run by family members have a stronger effect on performance compared to other types of corporate structures. Additionally, the research suggested that non-family businesses with actively engaged owners have similar performance to family-owned businesses, indicating that owner involvement in non-family businesses can contribute to their performance.

Din and colleagues (2022) researched how ownership structure affects a company's financial performance. They analyzed data from 146 manufacturing firms listed on the Pakistan Stock Exchange over 10 years. The study looked at institutional shareholdings, insider shareholdings, foreign shareholders, and government shareholdings, as well as return on assets, return on equity, market-to-book ratio, and Tobin's Q as the indicator of financial performance. To address potential issues with data, the researchers used the Generalized Method of Moments (GMM). Their results showed that institutional ownership had a notably positive impact on performance. They also found that insider ownership and government shareholding were significantly related to Tobin's Q.

Sun, et al. (2002) conducted a study on the correlation between government ownership and businesses in China. The study found that regardless of whether the government ownership was by a state or legal entity, it has a positive effect on partially privatized state-owned enterprises. Additionally, the study showed that this relationship was not linear and had a U-shape. The researchers also suggested that excessive government control is detrimental to enterprises, while minimal government ownership may not be beneficial either.

Theoretical Framework

Agency Theory

Agency theory was propounded in 1976 by Jensen and Meckling. The study argues that the separation of ownership from control is, in large part, due to a conflicts between the owner's interests and the manager's interests. It assumes that the interests of the owners and the interests of the managers are in opposition. One of the fundamental problems addressed by this theory is in the determination of ways that shareholders can induce managers to act in the best interest of the firm. But often, the managers operate to satisfy personalised interests. Usually, the agency theory assumes a two-sided relationship between the owners of the firm (principal) and management (agent), where the agents are better informed and exercise more discretion than the principals (Sadeghi, Banerjee, Ray, Bergen, & Dutta, 2022). These agents can exploit their privileged position. Based on these underpinnings, agency theory emphasizes aligning the interests of the principal with those of the agent.

Agency problems are self-inflicted because managers decide what to do with a firm's financial resources. The alignment between the owners and managers is referred to as the agency cost. A firm's financial performance is dependent on the reasons managers make decisions because the existing confluence between ownership and management interest will motivate managers to adopt decisions recognized as receiving oversight (Aksoy, Yilmaz, Tatoglu, & Basar, 2020; Din, *et al.*, 2022). These decisions will increase the firm's value. Conversely, when management decisions are recognized as diverging from the preferred oversight, it will decrease the firm's value.

Research Methods

Ex-post facto research design was employed since the data were historical and cannot be manipulated. The population consists of 53 Non-financial companies listed on the floor the Nigeria Exchange Group for a period of ten (10) years (2013 to 2022). In describing the variables, the study used the Descriptive statistics while the correlation analysis was adopted in ascertaining the relationships among variables. Also, Ordinary Least Squares (OLS), and some diagnostic tests were conducted to ensure the validity of the model. The econometric model is written as:

$$TOB-Q_i = \beta_0 + \beta_1 BIO_i + \beta_2 FLO_i + \beta_3 BFO_i + \beta_4 BGO_i + \beta_5 FS_i + \epsilon_i \quad (ii)$$

Where;

TOB-Q = Tobin-Q, BIO=Block Institutional Ownership, FLO = First Largest Ownership, BFO =Block Family Ownership, BGO = Block Government Ownership, FS = Firm size, ϵ is the error term, β_0 is the intercept term, β_1 , β_2 , β_3 , β_4 and β_5 are the coefficients for the respective variables.

Measurement of Variables

Proxies	Denotation	Measurement	Reference
Independent Variables of Interest			
Block Institutional Ownership	BIO	All of the block's institutional shareholders with 5% or more of the total shares (%) owned	Sinebe, et al. (2023)
First Largest Ownership	FLO	The percentage of ownership that the primary majority shareholder holds for the company's largest block of shares.	Ogbada, <i>et al.</i> (2021).
Block Family Ownership	BFO	Allocating the company's share to individuals or groups holding a minimum of 5% ownership in the company.	Camisón-Zornoza, <i>et al.</i> (2020)
Block Government Ownership	BGO	The majority ownership of shares is held by government block shareholders who possess at least 5% of the shares.	Sun, <i>et al.</i> (2002)
Dependent Variable			
Tobin-Q	TOB-Q	Market capitalization plus total liabilities minus cash divided by total asset	Apochi, <i>et al.</i> (2022).
Moderator			
Firm Size	FS	natural log of total asset	Chen, et al (2021) &

Descriptive statistics

Table 1: Summary of Descriptive statistics

STATS	TOB-Q	BIO	FLO	BFO	BGO	FSI
MEAN	1.374075	50.9717	40.86226	5.867925	.490566	7.036439
P50	.97	57	46	0	0	6.93915
MIN	-31	0	0	0	0	5.2394
MAX	9.29	98	84	73	14	9.2409
SD	1.250962	26.29355	22.01627	13.38783	2.189705	.798704
N	530	530	530	530	530	530

Source: Author's computation via STATA 13.

The descriptive statistics in Table 1 revealed that there are 530 observations and the TOB-Q has a mean value of 1.374075; which exceeds the median 0.97. This narrates how the distribution is a right-skewed. Also, the minimum value, maximum value and Standard deviation values are -0.31, 9.29, and 1.250962 respectively. In the case of BIO, the mean value of 50.9717, is lower than the median of about 57. The buttressed the left-skewed distribution. It maintained, 0 and 98, as minimum and maximum values while the standard deviation stood at 26.29355. The FLO had a mean of 40.86226, relatively lower when compared to the median of 46. This by implication asserts that a left

skewed distribution. A critical observation into the minimum and maximum values shows 0, and 84, having a broad spectrum and observed a standard deviation of 22.01627. The BFO maintained a mean and median values of 5.867925, and 0, suggesting a right-skewed. Its maximum value was 73, and the standard deviation 13.38783. The outcome of BGO had a mean 0.490566, and the median of 0, symbolising right-skewed distribution with many zero values. The maximum value is 14, and the standard deviation from the mean was 2.189705. Lastly, Firm size (FSI) has a mean of 7.036439 which is relatively more than the median of 6.93915. it depicts that FSI is right-skewed.

Correlation Analysis

Table 2: Summary of Correlation analysis

	TOB-Q	BIO	FLO	BFO	BGO	FSI
TOB-Q	1.0000					
BIO	0.1898	1.0000				
FLO	0.1713	0.7598	1.0000			
BFO	-0.0943	-0.5167	-0.2631	1.0000		
BGO	-0.0552	0.1905	0.1752	-0.0900	1.0000	
FSI	0.0122	0.1364	0.0452	-0.0069	-0.1303	1.0000

Source: Author's computation via STATA 13.

Table 2, discloses the correlation matrix existing among variables of study. A critical look at the outcome reveals that TOB-Q (dependent variable) has a weak positive with BIO, a weak positive association with FLO, and also weak and positive with FSI as their

values are 0.1898, 0.1713 and 0.0122 respectively. Furthermore, TOB-Q has a weak and negative association with both BFO and BGO as their values stood for -0.0945, and -0.0552.

Result for Multicollinearity Test

Table 3: VIF Result Test

VARIABLE	BIO	FLO	BFO	BGO	FSI	MEAN VIF
VIF	3.33	2.53	1.46	1.07	1.06	1.89
1/VIF	0.300641	0.394488	0.686303	0.937557	0.939703	

Source: Author's computation via STATA 13.

In observing the presence or absence of multicollinearity among variables, the study employed the Variance Inflation Factor (VIF) analysis as shown in Table 3. Observably, none of the mean exceed (>) 10

as stipulated in the VIF rule. It shows no presence of multicollinearity. The overall mean VIF is well suited below 5.

Breusch and Pagan Lagrangian Multiplier test

Table 4: Other Diagnostic Tests

Breusch and Pagan Lagrangian Multiplier test	
Decision rule	Accept alternative hypothesis (HA) if the p-value is significant, and reject the null hypothesis (H0) if the P-value is not significant.
Result	chibar2(01) = 0.00, Prob > chibar2 = 1.0000
Hausman Test	
Decision rule	When p-value becomes significant, the study will reject the null (H0) hypothesis and by implication would accept the alternative hypothesis (HA)
Result	(chi2): 179.21, Prob>chi2 = 0.0000

Source: Author's computation via STATA 13.

A critical look at the diagnostic tests in Table 4, showed that when the p-value records a figure such as 0.0000, against the 5% level of significance; it suggests strong evidence against the null hypothesis. A systematic difference between the estimated coefficients from the fixed-effects (FE) and random-effects (RE) models has been identified. The Hausman test is used to determine if there is a systematic difference between the coefficients from the FE and RE models. If the null hypothesis is rejected, the fixed-effects model is preferred over the random-effects

model. The Breusch and Pagan Lagrangian multiplier test is used to test the null hypothesis that the variance of the individual-specific random effects (u) in a random-effects model could be zero. In this case, the test statistic (chibar2) is 0.00 and the p-value (Prob > chibar2) is 1.0000, indicating that there is no need for random effects in the model as the probability value is not significant. Therefore, the null hypothesis is supported, suggesting that the fixed-effects model is more appropriate.

Hypotheses Testing

Table 5: Summary of Fixed Effect regression Result

	FIRM VALUE			
TOB-Q	COEF.	STD.ERR.	t	P> t
BIO	.0094625	.0036731	2.58	0.010
FLO	.0031749	.0038007	0.84	0.404
BFO	.0003503	.0047393	0.07	0.941
BGO	-.0656552	.0248596	-2.64	0.009
FSI	-.0229902	.067909	-0.34	0.735
_CONS	.9539433	.4801202	1.99	0.047
OBS				530
F(5,515)				2.96
PROB > F				0.0019

Source: Author's computation via STATA 13.

Table 5, shows the result from the fixed-effects regression model which is primarily used to show relationship among variables. The result revealed that BIO coefficient Positive of 0.0094625, and the p-value of 0.010 is significant at 5% confidence level. This in effect means that a unit increase in BIO, could possibly result in an increase in TOB-Q. The result for FLO has a positive coefficient of 0.0031749 but not significant with a high P-value of 0.404, at 0.05. In the event to increase FLO, may not automatically lead to any meaningful increase in TOB-Q. The result further shows that BFO has a positive coefficient 0.0003503, but not significant due to the huge value of P-value of 0.941, above the threshold of 0.05. This result suggests that an increase in BFO will not bring about a significant increase in TOB-Q. As further observed the outcome of BGO maintained a negative coefficient of -.0656552, but a significant P-value of 0.009, when compared to the 0.05 level of confidence. It depicts that an attempt to increase in BGO will bring a unit decrease in TOB-Q since they move in an opposite direction. The result also reveals that FSI has a negative coefficient of -.0229902, and insignificant with a value of 0.735 which is greater than the 0.05 level. An increase in FSI may likely result to decrease in TOB-Q. However, the Constant (_cons) intercept is statistically significant with p-value = 0.047, although very close to 0.05 level. Lastly, the result discloses that FSI has negative and insufficient impact on firm's value. This explains the fact that firm size has not been able to control the variable of performance. An attempt to increase firm size would result to firm having losses due to committed finance in services the different stakeholders.

Discussion of Results

Corporate ownership and firms' value is an interesting topical issue due to recent happenings in the business world such as liquidation and collapse and mergers and acquisition. Literature have had divergent view about

the outcome of corporate ownership on firm's value. Evident in this investigation, the findings from the examination indicated that Block Institutional Ownership (BIO) has a beneficial, substantial correlation with the measure of a company's worth. These results indicated that increasing BIO will ultimately lead to a positive increase in business value. These findings support the research of Din, et al (2022), which revealed that Institutional ownership has a positive and significant impact on a company's worth. Furthermore, the study showed that the First Largest Ownership (FLO) has a positive coefficient, however it is not significantly associated with the company's value. This result regarding FLO reinforces the conclusions drawn by Ogbada, et al. (2021), which indicated that First Largest Ownership does not have a noteworthy influence on a company's worth. In addition, the findings suggest that Block Family Ownership (BFO) has a positive, albeit not significant, effect on a company's worth. These results contradict that of Buchanan, et al. (2023), which showed that the number of family members actively involved in daily business operations has a significant negative relationship with firm performance. Furthermore, the result herein disclosed that Block Government Ownership (BGO) maintained a negative but significant impact on the firm's value. This finding as revealed in BGO digresses a bit from the findings of Din, et al (2022) which found that Government ownership has a Positive and significant relationship on firm's value.

Conclusion and Recommendation

This study investigated the relationship existing between corporate ownership structures on the value of non-financial companies listed on the Nigeria Exchange Group for a period of 10 years (2013-2022). This study used ex-post facto research and various statistical methods to examine the connections between variables and understand their relationships. The results showed that Block Institutional Ownership (BIO) has a

positive influence on firm value, demonstrating the important role of institutional investors in improving firm performance. On the other hand, Block Government Ownership (BGO) was found negative impact on firm value, suggesting inefficiencies linked to government ownership. Meanwhile, First Largest Ownership (FLO) and Block Family Ownership (BFO) had positive effects on firm value, but these effects were not statistically significant, highlighting the importance of a well-balanced ownership structure. Firm Size (FSI) had a negative but insignificant impact, suggesting that firms should carefully manage their growth and operational efficiency. This study conclude that companies and policymakers should be guided in achieving an optimizing ownership structures to enhance firm performance and value.

Emanating from the above, this study recommends that companies should encourage and attract more institutional investors because its positive and significance will bring in better governance practices and strategic oversight, which can enhance firm performance and value. There should be a monitoring mechanism to act as buffer to the insignificant of first largest ownership effect on firm's value. This could be done through diversifying ownership to mitigate potential risks associated with having a dominant single shareholder. The study further recommends that family-owned businesses need to re-assess their ownership structures thoroughly. The business environment is associated with volatile environment, it is very unwise for firms to negate the involvement of professional managers and advisors to balance family influence and business performance. The presence of government should be limited because it will be more beneficial for enhancing firm value. Firms should advocate for policies that reduces governmental stakes in companies, allowing for more private sector-driven growth and efficiency. Firms should embrace an optimal size that balances economies of scale with efficient management practices. Such as the continuous appraisal of asset utilization and operational efficiency regularly.

Leveraging Sport Marketing to Boost Nigeria's Tourism Industry: Opportunities and Challenges

ERUKAYE, Omosegho Jennifer; ODIA, Edith O.

Department of Marketing
Faculty of Management Sciences
University of Benin, Benin City.

Publication Date: 2025/11/28

Abstract

This study investigates how sport marketing contributes to the development of Nigeria's tourism industry. Despite Nigeria's vast tourism potential and growing interest in sports, the connection between both sectors remains underexplored. The problem addressed in this study is the lack of structured, data-driven strategies to link sport marketing with tourism growth. This gap has led to underutilized opportunities in regional events, international competitions, and grassroots sports that could otherwise attract tourists and drive economic gains.

The justification for the study lies in the urgent need to diversify Nigeria's economy and leverage non-oil sectors like tourism through innovative platforms such as sport. The objectives were to examine the role of sport marketing in promoting tourism in Nigeria and to identify the challenges limiting its effectiveness. The study adopted a qualitative approach, relying on peer-reviewed journals, academic articles, and empirical studies.

Findings show that sport marketing significantly supports tourism through event branding, sponsorships, and athlete-driven campaigns. However, infrastructure gaps, weak coordination, and poor digital penetration limit its full potential. The study concludes that integrated stakeholder engagement and targeted investments in digital marketing are essential. It recommends institutional reforms and capacity-building as practical steps for progress.

Keyword: Infrastructure, Security, Sport Marketing, Stakeholders and Tourism Industry

Introduction

Tourism is a recognized driver of economic growth, cultural exchange, and national image enhancement. In countries with coordinated development strategies, tourism contributes significantly to GDP and employment. In Nigeria, this sector remains underdeveloped despite abundant natural resources, cultural diversity, and sporting potential. The National Bureau of Statistics (2022) estimates tourism contributes less than 4% to GDP, indicating major structural weaknesses. Countries like South Africa have successfully integrated sport into tourism policy, but Nigeria continues to treat the two sectors in isolation. This separation weakens the potential of sport as a tool for tourism growth and economic diversification.

The tourism industry. Nigeria's tourism sector lacks visibility, structured branding, and coordinated national campaigns (Uthman & Sadiq, 2024). Annual sporting events such as the Lagos City Marathon, Okpeke Road Race, and the National Sports Festival attract athletes and participants, but their potential to attract

visitors or stimulate local economies is often lost. Beatrice and Oghenebrorien (2024) argue that sports entrepreneurship in Nigeria is growing, but its synergy with tourism has not been effectively structured. The challenge lies in weak marketing, institutional fragmentation, and low investment in sport tourism packaging. Sport marketing, when structured and implemented effectively, connects sport events with tourism promotion by attracting audiences, sponsors, and international attention.

While the academic literature on sport and tourism in Nigeria is growing, most studies treat them as separate disciplines. For example, Julius and Patrick (2024) assessed customer satisfaction in event tourism, while Ajake (2020) explored tourism strategy in Cross River State. There are also works like Adeyemo et al. (2023) which focused on localized sport tourism activities. However, none of these studies address the strategic application of sport marketing as a deliberate tool for national tourism promotion. This fragmented approach leaves a gap in understanding how sport assets athletes,

teams, events can be professionally marketed to support tourism outcomes.

This study addresses that gap by examining the practical opportunities and barriers that exist in leveraging sport marketing for tourism development in Nigeria. The issue is urgent. Nigeria is in a post-oil economy transition phase and needs non-oil revenue streams. Abubakar et al. (2020) emphasized that sport tourism could drive infrastructural development and job creation. Ibagere (2023) also highlighted the role of media and broadcasting in promoting sports events, yet policy linkage to tourism outcomes remains absent. Without a deliberate sport marketing strategy, Nigeria continues to miss out on the global tourism revenue generated through sporting events, sponsorship, and sport heritage.

The objectives of the study was to: assess how sport marketing strategies can be used to promote tourism in Nigeria and identify the major barriers hindering the integration of sport marketing into Nigeria's tourism development framework. This research used a qualitative approach, drawing data from scholarly literature. Journals, peer-reviewed articles, conference papers, and institutional reports serve as primary data sources. The review focused on current sport marketing models, tourism strategies, and policy evaluations relevant to Nigeria. The aim is to extract practical insights for policymakers, investors, and researchers seeking to improve sport-tourism integration.

Literature Review

Conceptual Review

Sport Marketing

Sport marketing refers to the strategic promotion of sport events, teams, organizations, and associated products or services to drive engagement, loyalty, and revenue. It operates on two levels: the marketing of sports themselves (e.g., competitions, athletes, teams) and the use of sports as a platform to market non-sport products or services. Globally, sport marketing has become a multi-billion-dollar industry, supported by digital innovations, sponsorships, merchandising, and broadcasting. According to Silva and Casas, (2020), this field plays a critical role in shaping the perception of sports entities and aligning them with fan bases. Additionally, Eskiler et al., (2021) emphasized that effective sport marketing requires audience understanding, message clarity, and media synergy to influence behavior and achieve brand objectives.

In Nigeria, sport marketing is still at a developmental stage. Though the country has a rich history of sporting talent and community interest, the commercialization of sports remains minimal. Many Nigerian clubs lack professional marketing departments or dedicated sponsorship structures. The Nigerian Professional Football League (NPFL), for example, suffers from

poor branding, inconsistent fan engagement, and low media value (Akarah, 2012). While there is national interest in football, basketball, athletics, and combat sports, the marketing infrastructure around these events is weak or informal. Research by Tubosun et al., (2019) found that only 30% of sport organizations in Nigeria had active sponsorship or merchandising campaigns in the last three years, with most relying on government subventions for survival.

The main challenge with sport marketing in Nigeria is the lack of strategic planning and investment. Stakeholders often see sports only from the lens of physical performance, rather than a platform for economic development. There is limited understanding among sports administrators about branding, audience analytics, or revenue models. As identified by Anifowose and Adejumo, (2020), sport managers rarely use consumer data, fan feedback, or market trends to guide promotional decisions. Similarly, Iheanacho et al., (2013) argue that most sport events in Nigeria lack commercial packaging that would make them attractive to sponsors or international media. This results in poor exposure, low turnout, and missed revenue opportunities.

Another problem is the underdeveloped relationship between media and sport marketing. Media coverage in Nigeria focuses heavily on European leagues, while local leagues and events receive minimal attention. This affects viewership, engagement, and advertiser interest. According to Akarah, (2012), over 75% of Nigerian sport content consumed online or through TV is foreign. Without strong media partnerships, sport marketing campaigns cannot achieve scale or sustainability. In addition, digital marketing one of the strongest global growth areas remains underused in Nigeria's sports scene. Only a few athletes and clubs maintain active online platforms, and most lack content strategies to reach fans or attract commercial partners (Girsang, 2022).

Despite these challenges, there are signs of progress. The annual Lagos City Marathon, supported by private sponsors and media partners, has gained continental attention. Similarly, the Basketball Africa League (BAL) partnership with Nigerian teams has introduced structured media and sponsorship model (Elyasi, 2024)s. These examples show that, with proper strategy, Nigerian sports can attract global interest. As argued by Akarah, (2012), integrating sport marketing into national development plans can support job creation, brand export, and tourism growth. Sport marketing should not be seen as a support activity it is central to the sustainability of any professional sports ecosystem. You need to understand the importance of developing sport marketing in Nigeria if the country hopes to transition its sporting potential into real economic value. Without robust marketing strategies, local sports

will continue to struggle for relevance and revenue. Academic research must shift focus toward building frameworks that are practical, scalable, and tailored to Nigeria's unique market. This section lays the foundation for evaluating how sport marketing, if properly developed, could support tourism development across the country..

Sport Marketing Encompasses Various Aspects, Including

Sport marketing is made up of several strategic components that support the promotion and commercial growth of sports. One major aspect is **event marketing**. This involves planning and promoting sports competitions to attract fans, sponsors, and broadcasters. When done correctly, it increases visibility, drives attendance, and supports tourism. Alma (2024) notes that well-executed event marketing links community values with commercial goals. In contrast, Nigerian events often suffer from weak planning and limited brand exposure (Tyo, 2022).

Another aspect is **athlete branding**. This involves using athletes' public image to market products or services. Globally, top athletes serve as brand ambassadors, drawing corporate interest. Nigeria's athletes like Tobi Amusan are underexposed due to limited branding infrastructure. Longa (2025) links athlete visibility to gender equity and legal protections, which are lacking in Nigeria. Also, poor representation reduces athletes' commercial appeal (Kaya et al., 2025).

Sponsorship activation is also key. This includes full brand engagement through co-branded content, digital promotions, and experiential campaigns. Today's sponsors seek audience insights and long-term partnerships. Sztuk (2025) argues that territorial marketing must build shared value between brands and fans. Many Nigerian sport institutions fail to deliver this due to lack of market data (Alma, 2024).

Media rights and broadcasting are core drivers of revenue. Strong partnerships with TV and digital platforms expand fan reach and attract advertisers. Yet, Nigerian leagues depend on limited domestic coverage and have weak digital distribution (Tyo, 2022). This makes it harder to monetize content or build international followership.

Fan engagement and digital platforms also define modern sport marketing. Clubs use social media, mobile apps, and merchandise to connect directly with fans. Nigerian teams rarely collect or analyze fan data. Kaya et al. (2025) explain that sport engagement now extends into digital entertainment, including esports. Without digital strategies, teams lose relevance and revenue (Sztuk, 2025).

Finally, **venue branding** includes naming rights, concession deals, and hospitality. Most Nigerian facilities lack commercial models and depend on public funds. Alma (2024) recommends public-private

partnerships to revitalize stadiums. Tyo (2022) supports structured infrastructure management as a way to attract international attention and investment.

Importance of Sport Marketing in Nigeria

Sport marketing plays a crucial role in shaping economic, social, and national development outcomes. In Nigeria, this is particularly relevant due to the country's growing youth population, increasing sport participation, and expanding media reach. A strong sport marketing system can unlock revenue streams, attract sponsorship, and grow public engagement with local sport content. Emunah (2025) emphasized that the lack of strategic marketing in African football markets contributes to poor commercialization outcomes, especially in Nigeria. Okigbo et al. (2024) added that sport media campaigns enhance customer connection and promote consumer behavior, which are essential for growing Nigeria's internal sport economy.

One of the most direct impacts of sport marketing is job creation and economic stimulation. Marketing campaigns require creative services, digital content production, merchandise development, and event management. These activities employ hundreds across sectors. In their study, Khusanovich (2025) found that countries with well-marketed sporting events experience spikes in service sector growth during and after the events. Emunah (2025) also observed that football marketing campaigns in Nigeria support retail sales, venue activation, and local hospitality. These effects are especially important in Nigeria's fragile job market.

Another reason sport marketing matters is its potential to rebrand national identity. Nigeria's international sport image remains underdeveloped. Poor media presence and weak branding around athletes make the country less competitive in the global sport business. Okigbo et al. (2024) highlighted that targeted media narratives shape how sports from emerging economies are perceived. Nigeria's failure to tell its own stories through sport reduces interest from both global fans and sponsors. Khusanovich (2025) emphasized that sport marketing, when linked to national symbols and storytelling, drives interest in both tourism and foreign investment.

Sport marketing also builds community identity and youth engagement. Nigeria has the youngest population in Africa, yet most young people consume foreign sport content. Emunah (2025) found that 78% of Nigerian youth follow European leagues, while local clubs have less than 10% digital reach. Without investment in marketing, local sport brands will continue to lose relevance. This disconnection not only hurts the sport economy but reduces opportunities for cultural connection and local pride.

Tourism and Tourism Development

Tourism has become a critical sector for economic growth, especially in countries with cultural and ecological richness. In Nigeria, tourism remains underutilized, despite its potential to diversify revenue streams and create jobs. Tourism accounted for less than 4% of Nigeria's GDP in 2022, even though destinations such as Yankari Game Reserve and Olumo Rock attracted increasing interest (Ibanga, 2024). A lack of infrastructure and unreliable security systems have discouraged sustained development, but reforms in public-private partnerships are slowly improving that outlook (Yang, 2022).

Sustainable tourism has been gaining policy attention in Africa. Governments now realize that tourism development needs to be environmentally sound, locally inclusive, and economically viable. Nigeria's Ministry of Information, Culture and Tourism initiated a multi-phase plan in 2023 aimed at protecting heritage sites while increasing visitor flow to eco-tourism areas like Cross River National Park (Yang, 2022). Parallel to this, research shows that integrating renewable energy into tourism infrastructure reduces operating costs and carbon footprint while appealing to international tourists who prioritize sustainability (Ibanga, 2024).

Another area shaping tourism development is digital transformation. Smart tourism technologies—like mobile booking platforms and AI-driven visitor data systems—are transforming visitor experiences. In Nigeria, adoption remains uneven due to gaps in digital literacy and connectivity. Still, global trends suggest that digital investments lead to longer visitor stays and higher satisfaction (Astanakulov et al., 2025). These findings suggest that your strategy must include tech integration to remain competitive in regional tourism markets.

Cultural tourism is also emerging as a tool for both economic inclusion and identity preservation. A 2025 report showed that rural communities in sub-Saharan Africa gained up to 18% household income growth by participating in locally-led tourism cooperatives (Newerli-Guz et al., 2025). Nigeria holds immense potential in this area, with Nollywood, traditional festivals, and crafts attracting a growing audience both locally and internationally. Still, monetization mechanisms remain weak, requiring stronger community-business frameworks.

Types of Tourism

Tourism has evolved into a fragmented system of specialized experiences, each reflecting unique motivations, demographics, and economic implications. Understanding these types is essential for you if you're planning sustainable development or policy interventions. For example, leisure tourism, often

driven by rest and recreation, remains the dominant form globally. According to Erenwa (2023), active tourism, a subcategory of leisure, has grown in Nigeria due to increased interest in wellness and cultural festivals. Business tourism, on the other hand, continues to fuel urban hospitality sectors in cities like Lagos and Abuja (Zaki et al., 2021).

Medical tourism has gained traction across Africa. In nations with underfunded local healthcare, wealthier travelers now cross borders to access better treatments at reduced costs. A study by Kaushik and Rustagi (2020) reported an 8.5% global compound annual growth rate in medical tourism, with countries like India and South Africa being top destinations. Meanwhile, eco-tourism has carved out a niche in Sub-Saharan Africa. Its appeal lies in low-impact, conservation-minded travel. According to Carlisle et al. (2021), ecotourism helps fund protected areas while offering employment to local communities.

Religious tourism plays a unique role, especially in culturally diverse nations. Pilgrimages to Mecca for Hajj are one of the most prominent examples. Yet, pilgrimage sites within Nigeria, such as Osun-Osogbo Sacred Grove, attract thousands yearly. Research by Widz and Brzezinska-Wójcik (2020) emphasized the role of spiritual travel in cultural preservation. Similarly, educational tourism is growing among youth seeking cross-border academic enrichment. A report by Bratić et al. (2025) observed that universities in countries like South Africa now attract foreign students not just for learning, but also for heritage experiences. Rural and agro-tourism are seeing investment as alternatives to crowded city destinations. They support inclusive growth in remote areas, offering hands-on farm experiences and community living. Kahangirwe et al. (2025) stress that these forms of tourism empower local economies while preserving traditional livelihoods. Additionally, shopping tourism is now considered a separate category, with travelers organizing trips around access to exclusive or cheaper goods (Newerli-Guz et al., 2025). Each type of tourism reflects evolving consumer values. Knowing the distinctions allows your strategies to target real needs, whether you're building infrastructure or running a local business.

Tourism Industry in Nigeria

Nigeria's tourism industry has both potential and persistent barriers. Despite rich landscapes, historical sites, and a population eager for domestic travel, tourism remains under-leveraged. The sector contributed only 2.8% to GDP in 2023, largely due to low infrastructure investment and inconsistent national policy (Johnny & Wenner, 2015). Compounding the issue is a lack of coordination between federal and

state-level agencies, which limits scale and integration of tourism zones (Yustie et al., 2022).

Domestic tourism is rising, especially among middle-income earners in urban regions. Attractions such as Obudu Mountain Resort and Erin-Ijesha Waterfalls have recorded higher local visits post-COVID (Ofre et al., 2015). That said, growth has been uneven. The northeast and other security-compromised zones remain inaccessible to both foreign and domestic tourists (“UNWTO World Tourism Barometer and Statistical Annex, January 2022,” 2022). Without consistent security strategies, key eco-tourism and heritage regions will remain disconnected from the wider economy.

The global perception of Nigeria also plays a role. Negative media coverage and weak branding reduce international arrival numbers. In 2022, the country received fewer than 1.3 million international tourists, despite having the largest population in Africa (Ndanusa et al., 2014). Branding campaigns are often fragmented, lacking measurable calls-to-action for international partners (Damayanti et al., 2022). Countries like Ghana and Rwanda have surpassed Nigeria in digital tourism promotion, using cultural diplomacy and social media integration.

Investment remains a challenge. Although the Nigerian Tourism Development Corporation (NTDC) promotes private sector engagement, high entry barriers persist. Unstable tax regimes, poor road networks, and unreliable utilities keep investors away from rural destinations (Anwuri & Osuoha, 2022). Incentive packages exist but are often delayed or mismanaged, pushing capital to neighboring economies like Benin and Togo.

The skills gap is another area of concern. The hospitality and service sectors suffer from untrained staff, limiting tourist satisfaction and return visits (Jackson, 2017). Tourism-focused institutions offer limited programs, and there is little linkage between training and employment. Without improving vocational education in tourism management, service quality will continue to drag the industry’s reputation.

Opportunities for Leveraging Sport Marketing in Nigeria

Sport marketing in Nigeria presents major opportunities across media, tourism, branding, and economic engagement. First, the rise of digital platforms allows you to bypass traditional infrastructure limitations. With over 100 million internet users in Nigeria, sports organizations can build direct-to-fan channels, offer streaming subscriptions, and drive merchandise sales online. Iheanacho et al., (2013) note that clubs leveraging digital strategies see 45% higher fan retention. In a similar study, Girsang, (2022) found that social media marketing increased

club revenue by over 30% in selected Nigerian football leagues.

Nigeria’s large youth population also creates a strong market for local sport engagement. Over 70% of Nigerians are under 30, and most actively follow international sports. By investing in local sport events, cities can convert this interest into domestic travel, ticket sales, and sponsorship attraction. According to Roper, (2015), hosting mid-size sports events in local communities stimulates micro-enterprise growth and tourism inflows. Elsheikh et al., (2022) argues that localized sports branding creates community pride and business participation around grassroots sports.

Global partnerships are another untapped avenue. Nigerian athletes, especially in football and athletics, already compete at international levels. This global presence can be leveraged to attract international sponsors, federations, and event organizers. Ndanusa et al., (2014) argue that Nigeria’s diaspora and sporting icons can be positioned as cultural ambassadors to increase tourism interest. Cultural Tourism in Nigeria: Towards a National Identity, (2022) adds that successful use of athletes in global campaigns can attract tourism through perception branding.

Sport infrastructure development also holds opportunity. Public-private partnerships (PPPs) can fund modern stadiums, training centers, and sport tourism resorts. These serve both local athletes and attract international sporting activities. A report by Ogunyemi and Daramola (2024) highlighted that PPP-funded facilities in Lagos and Abuja increased tourism footfall by over 22% in 2023. Anwuri & Osuoha, (2022) also found that multipurpose sport venues can double as event and hospitality hubs if branding is professionally managed.

Finally, sport education and talent development attract sponsorship from banks, telecoms, and FMCGs. Youth development programs tied to professional pathways offer brands measurable impact and future consumer loyalty. Akarah, (2014) noted that 64% of Nigerian parents would support youth sport if it linked to job skills or scholarships..

Challenges in Leveraging Sport Marketing in Nigeria

Sport marketing in Nigeria faces persistent structural and institutional challenges that limit its impact on tourism and national branding. One core issue is poor infrastructure. Stadiums, training centers, and support facilities remain underfunded or obsolete. Akarah, (2014) reported that only 25% of state-owned sports facilities meet international hosting standards. Separately, Assessing Management Practices of Sport Facilities and Equipment by the Municipality Council, (2018) observed that inadequate public transport to

sporting venues discourages domestic sport tourism and large event attendance.

Corruption and mismanagement also block progress. Sponsorship deals are often non-transparent, leading to loss of trust among investors. In a recent audit of sports federations, Chukwurah et al., (2021) highlighted contract inflation and lack of oversight in over 60% of cases examined. Similarly, Andrews and Harrington, (2016) found that grassroots programs rarely reach intended communities due to fund diversion or politicization.

Marketing capacity is low across many sport bodies. Few have dedicated communication teams or long-term media strategies Chukwurah et al., (2021) found that over 70% of Nigerian sport organizations rely on volunteer-run social media pages with no structured content plans. Girsang, (2022) emphasize that branding without consistent digital storytelling results in low fan engagement and short sponsorship life cycles

Athlete development systems remain weak. Most young talents lack access to proper coaching, exposure, or physical infrastructure. Ezike, (2014) reported that fewer than 15% of secondary schools in Nigeria offer structured sport talent development programs. Ferguson, (2022) noted that this directly affects long-term brand loyalty and content creation tied to emerging stars.

Legal and policy uncertainty discourages private investment. There is no unified sport marketing policy framework at the national level. Obeta, (2024) argue that overlapping jurisdiction between federal and state sports ministries leads to duplication and confusion. Tubosun et al., (2019) observed that investors frequently exit deals due to unclear regulatory obligations and inconsistent taxation rules. Finally, media rights remain underexploited. Broadcasters rarely invest in local sport because of low production quality and piracy. Owonikoko, (2020) explained that Nigeria loses an estimated ₦3.5 billion yearly from unlicensed sport content sharing, while foreign leagues dominate the airwaves.

Theoretical Review

The study used two theories, which are Social Identity Theory and Stakeholder Theory. The study adopted Social Identity Theory.

Social Identity Theory (SIT)

Social Identity Theory was propounded by Henri Tajfel and John Turner in 1979. It emerged from research in intergroup behavior, where Tajfel explored how group membership shaped individual identity and intergroup dynamics.

The central argument of SIT is that individuals derive a significant portion of their self-concept from the social groups they belong to. These identities, shaped by

perceived group norms and boundaries, guide how people behave toward in-groups and out-groups. The theory maintains that individuals instinctively assign themselves and others to social categories, including nationality, profession, ethnicity, and athletic allegiance. Such categorization elicits in-group favoritism and out-group derogation, thereby shaping attitudes and behaviours at the group level (Polat et al., 2024). Within sport marketing, Social Identity Theory (SIT) is regularly referenced to elucidate mechanisms of team loyalty, fan conduct, and consumer-brand congruence, as individuals materially strengthen attachments to franchises that authenticate and reproduce their social identity (Teare et al., 2025). Also, these identities are maintained by visual ciphers, ceremonies, and shared discourses that intrinsically join members to the group and eventually influence their consumer and communicative behaviours..

SIT posits that individuals will strive to secure a favourable social identity, a process that customarily involves a favourable inter-group comparison with a salient out-group. The categorization itself is envisioned as an automatic, often pre-reflective, operation that insidiously configures attitudes without conscious meditation. The rank of the group itself is consequential, since individuals are inclined to affiliate with collectives that confer enhanced self-esteem (Mate et al., 2024). Identity is likewise regarded as supple and situational, adjusting in accordance with the contextual frame, a trait that clarifies the ease with which subjects may reorient their loyalty within multi-team spectacles or national tournaments (Alma, 2024).

Critiques contend that Social Identity Theory (SIT) forecasts collective cognition to an excessive degree whilst underestimating temporally contingent individual agency. Such an imbalance partially arises from the theory's relative neglect of power relations and systemic inequalities that shape identity formation (Sousa-Silva et al., 2024). Furthermore, SIT tends to represent social categories as singular and monolithic, effacing the internal complexity and discord that characterise virtually all collective identities. Another limitation lies in SIT's failure to accommodate the variable and context-specific geographies in which identities are negotiated, as evidenced in sport, ethnicity, and socialisation (Lu et al., 2024). Finally, the model has been characterised as 'psychologically thin', as it systematically overlooks the affective, and often pre-reflective, processes that orient and modulate acts of identification.

Social Identity Theory (SIT) offers a robust conceptual framework through which phenomena such as consumer engagement, collective brand co-creation, and varied tiers of supporter activity can be scrutinised within sport-marketing scholarship. The magnitude of identity as a mediating construct renders Sport industry

practitioners capable of executing finely calibrated behavioural nudges when promoting sport properties and events. Adherents of sport culture frequently acquire branded merchandise, congregate in stadiums, or affiliate with digital platforms independent of specific performance indices, hence reaffirming an overarching collective self-schematic (Makoondlall-Chadee et al., 2024). By adapting SIT heuristics to tourism-oriented sport messaging, brand communicators gain a disciplined technique for crafting narratives that foreground shared in-group norms, culturally mediated storylines, and locally endorsed symbolic motifs. Such a strategic orientation is duly potent in the African context, where relational primacy and a pervasive sense of collectivism inform consumer trajectories and participatory practices.. Furthermore, the framework provides anticipatory insights and managerial controls over collective conduct in the design of mega-events or the branding of sport-oriented travel destinations. When initiatives invoke communal pride and strategic identity, the likelihood of heightened co-engagement and the perception of brand genuineness increase, thus reinforcing affective ties and loyalty to the brand (Chang, 2024).

Stakeholder Theory

Stakeholder Theory was first articulated by R. Edward Freeman in 1984 in *Strategic Management: A Stakeholder Approach*, where he critiques the orthodox principle that firms exist only to maximise returns to shareholders. He contends that pragmatic managerial rationality requires firms to systematically identify and attend to any group whose legitimate interests may be positively or negatively influenced by the firm's activities. Since that seminal exposition, the theory's conceptual apparatus has proved fruitful for diverse applied fields, including tourism, sustainability, and sport management.

Fundamentally, Stakeholder Theory posits that corporate legitimacy derives not merely from delivering profit to equity-holders but from maintaining responsible citizenship in a network of interdependent actors. Its normative core privileges ongoing dialogue, reciprocity, and the co-creation of value, thereby embedding accountability, long-range trust, and ethical governance within strategy. Applied to sport and tourism, the theory underscores the necessity of inclusive collaboration involving local residents, sponsors, spectators, public authorities, and tourism boards, positing that such collaboration is indispensable for enduring viability. In the arena of sport marketing, the theory informs the design of alliances that harmonise corporate, civic, and emotional value through the stages of event conception, brand strategy articulation, and socially oriented legacy

design (Wang & Gao, 2021; Peña-Miguel & Cuadrado-Ballesteros, 2022).

Stakeholder Theory operates on the premise that all affected parties possess inherent value and merit equitable treatment and esteem. It postulates that corporations inhabit web-like social orders and that stakeholder preferences fundamentally influence, and are in turn influenced by, one another. According to the theory, organisational viability depends on the forthright, principled administration of stakeholder relationships, the success of which cannot be guaranteed through the primacy of near-term profit (Parmar et al., 2021). Additionally, it affirms that tensions between stakeholder claims are to be regarded as inevitable and as resolvable through persistent discourse and the pursuit of common goals (Zhao et al., 2023).

The theory is vulnerable to substantial critique whose scope is sharpened by the absence of a settled definition of stakeholder, a lacuna that critics maintain renders the construct susceptible to imprecision and that, in turn, jeopardises officer responsibility and strategic coherence (Schreck & Raithel, 2020). Further, the theory is besieged by its apparent incapacity to establish a hierarchy among converging claims; the contest, for instance, to reconcile the preferences of a local populace against those of a corporate sponsor in sport tourism initiatives, exposes both an ethical and a managerial quagmire (Dmytriiev et al., 2021). There is a broad academic view that regards the theory as prescriptive rather than as an explanatory, and the limitations of its normative framework, in combination with the unpredictability of actual markets, call into question its capacity to generate reliable forecasts (Hörisch et al., 2020).

The investigation into employing sport marketing as a driver of tourism growth in Nigeria employs Stakeholder Theory to codify the function of joint networks. Within the Nigerian setting, the tourism and sport ecosystem encompasses the Ministry of Tourism, the Nigerian Football Federation, corporate sponsors, resident communities, and spectators. The theoretical framework posits that sport-facilitated tourism dissemination achieves optimal impact only when the delineated actors engage in purposeful cooperation, calibrating promotional tactics to harmonise with explicit social and economic imperatives (Anh, 2023). A salient exemplification of this dynamic resides in the organisation of co-hosted competitive fixtures that equally engage tourism authorities and sporting governing bodies, thereby enhancing both the nation's global corporate identity and the localized draw of targeted regions.

Stakeholder Theory also helps explain the dynamics of trust and participation that affect the success of sport-based tourism campaigns. For example, fans often

serve as brand ambassadors whose engagement directly influences travel behavior. Ignoring their interests weakens the loyalty needed for repeat tourism. In line with Freeman's propositions, the theory affirms that meaningful participation from all involved groups—especially at the grassroots level—leads to sustainable outcomes. Therefore, by embedding this theoretical lens, the study recognizes tourism development as not only a marketing exercise but also a multi-actor engagement strategy (Teplitz, 2025).

Empirical Review

Erenwa (2023) in "Active Tourism: The New Tourism Trends in Africa (Nigeria Precisely)" examined Nigeria's shift toward active tourism. The study aimed to evaluate its impact on local economies and public health. Conducted in Lagos, the research used structured interviews and thematic analysis. It found growing interest in wellness-focused activities like hiking and sports travel. The author concluded active tourism is rising and recommended national frameworks to support this shift.

Gamba (2025), in "The Marketing Strategies of International Restaurant Chains (IRCs) in Tanzania," explored how tourism drives food service strategy. The study was done in Dar es Salaam to assess marketing adaptation by IRCs. Using survey tools and regression analysis, the findings indicated that tourist inflows shape menu localization and branding. The conclusion emphasized tourism as a key marketing factor for hospitality businesses. Recommendations called for synergy between tourism boards and restaurant investors.

Khanyile et al. (2025), in "Enhancing Service Quality in Public Recreation Hubs," conducted a qualitative study in Gauteng Province, South Africa. The aim was to explore user satisfaction with government-managed sport facilities. Data were gathered via focus group discussions and analyzed using NVivo. The study showed that poor maintenance and low staff engagement affected attendance. The conclusion advised immediate policy reforms to enhance recreation center usage.

Strawn (2025), in "The War on Tourer," studied how terrorism affects tourism flows in Nigeria and the wider MENA region. Using data from national tourism boards and structured interviews, the study identified a clear link between perceived insecurity and reduced tourist spending. Conducted across Abuja and Maiduguri, thematic analysis showed tourism decline post-terrorist events. The study recommended robust security communication to rebuild Nigeria's tourism confidence.

Lornede and Zheng (2025), in "Factors Influencing Merchants' Willingness to Participate in E-commerce Marketing in Digital Africa," focused on Lagos,

Nigeria. Their objective was to explore merchants' attitudes towards online sports-related commerce. A survey of 300 merchants was conducted and data were analyzed using SPSS. Results showed low participation due to distrust in digital platforms and lack of digital literacy. The authors recommended training programs and improved payment systems to support digital marketing in the sports industry.

Ajuzieogu and Nnamdi (2025), in "Nigeria's Fraud Reality: Dismantling Global Stereotypes Through Data," focused on media portrayal and its impact on Nigeria's tourism image. Using datasets from global crime indices and tourism flows from 2020–2025, the research identified media-induced perceptions as a key barrier to tourism. Statistical tools like correlation matrices were used for analysis. The conclusion emphasized improving Nigeria's global narrative. The study called for public-private collaboration in rebranding national image.

Oladunjoye and Chaka (2025), in "Digital Technology and Agricultural Productivity in South Africa," included tourism as part of broader rural development. Conducted in Limpopo Province, the study used structured surveys and logistic regression. Findings showed tourism and agritourism enhanced digital adoption in remote communities. It concluded that rural tourism investments trigger tech-based entrepreneurial behavior. The study recommended tailored rural tech infrastructure to leverage tourism for development.

Discussion of findings

The findings from the reviewed studies emphasize that sport marketing has a measurable impact on tourism development in Nigeria. Erenwa (2023) showed that integrating sports and wellness tourism increased domestic tourist participation, highlighting a 20.9% projected growth in active tourism between 2020 and 2025. In a related study, Khanyile et al. (2025) found that sport-focused public recreation hubs in South Africa positively influenced community cohesion and visitor frequency, especially where facility branding and quality were strong. Lornede and Zheng (2025) examined e-commerce marketing's impact on digital participation among sport merchants in Lagos and discovered that branding campaigns significantly shaped consumer trust and engagement. Similarly, Gamba (2025) reported that international leisure chains leveraged the 7Ps of marketing to adjust product placement for sports-related consumers, improving loyalty in African markets. Bingwa and De Meyer-Heydenrych (2024) explored digital loyalty behaviors in sport-related purchases and concluded that consistent promotional messaging aligned with identity-based appeals yielded stronger consumer retention.

On the second objective, which examined the challenges in leveraging sport marketing for tourism,

several scholars identified structural, technological, and perceptual barriers. Ajuzieogu and Nnamdi (2025) emphasized the African data paradox, where inconsistencies in data reporting limit accurate sport-tourism analytics. Strawn (2025) noted that regional instability and perceptions of insecurity continue to reduce inbound sports tourism, especially in Nigeria and the MENA region. Oladunjoye and Chaka (2025) observed that the digital divide in Africa slows innovation in sport tourism marketing, especially among rural businesses. Nguyen Hoang Thanh and Lee (2025) examined the role of public-private partnerships in tourism development and found that in African contexts, bureaucratic bottlenecks often stall sport-tourism projects. Lastly, De Meyer-Heydenrych et al. (2024) reiterated that inconsistency in brand experience across sport events leads to low tourist retention, especially among millennials (De Meyer-Heydenrych et al., 2024).

Conclusion

The study has shown that sport marketing plays a measurable role in influencing tourism growth in Nigeria. Properly managed sports events, brand partnerships, and promotional campaigns attract both domestic and international tourists. Sport marketing stimulates tourism by driving visibility and increasing local participation. To-date, digital platforms and personalised multifunnel marketing leveraged by identity-based propositions have demonstrably heightened consumer interactivity and, concomitantly, brand allegiance, thereby underpinning long-term visitor retention in the tourism sector. Yet such gains remain tempered by systemic impediments. Decentralised transportation and event infrastructure, deficient inter-agency regulatory alignment, circumscribed private-finance mobilisation, and uneven regional proficiency in data-driven outreach collectively limit the prospective scale of sport-led tourism.

Persistent inter-sector housing implausibility, pulverised consumer and operational datasets, and a measurable insecurity gradient further hinder the predictable trajectory from marketing stimuli to realised visitation and expenditures. Consequently, while sport marketing articulates a conspicuous opportunity, attainable sustainability and leverage of external or intra-national loyalty hinges upon Nigeria's capacity to resolve enduring structural impediments and synchronise diverse public, private, and civic coalitions. Without measures that agreeably pair systemic reform, harmonised investment, and stakeholder alignment, the tourism economy will likely remain inertial and confined, beneath its apparent comparative and absolute growth trajectory within

sports and, by extension, ancillary reputational marketing.

Recommendations

1. Institutionalize Stakeholder Collaboration: To make sport marketing effective for tourism, Nigeria needs a formal framework that links tourism boards, sports commissions, local governments, and private sponsors. Such collaborations should define roles, set marketing objectives, and ensure alignment of sport events with national tourism goals. This would reduce duplication, improve resource use, and strengthen the commercial viability of sport-tourism campaigns, especially during regional and international sporting events.

2. Build Digital Marketing Infrastructure and Capacity: To reach younger and global audiences, the government and tourism marketers should invest in digital skill development and infrastructure. The digital divide limits the reach and performance of sport marketing campaigns. Local SMEs and event organizers need tools and training to run effective online campaigns that promote sports events tied to tourism destinations. Support through grants or partnerships with tech platforms could help regional organizers adopt social media strategies and mobile-friendly booking systems. This will make tourism more accessible and marketable across digital channels.

Publication Date: 2025/11/28

Abstract

This study titled “Just-In-Time Practices and Operational Performance of Fast Food Restaurants in Warri Metropolis, Delta State, Nigeria” examined the effect of JIT practices on cost reduction, service quality, delivery efficiency, and productivity. The objectives were to ascertain the influence of JIT on service quality, cost, and delivery; to evaluate its implementation on operational performance; and to determine how JIT enhances productivity and competitiveness. A descriptive survey design was adopted, with a target population of staff drawn from selected fast food restaurants in Warri metropolis. Stratified random sampling was used to obtain a sample size of 279 respondents. Data were collected through structured questionnaires on a five-point Likert scale. Validity of the instrument was ensured through expert review, while reliability was tested using Cronbach’s Alpha, with all constructs achieving values above 0.70. Data were analyzed using descriptive and inferential statistics. Findings revealed that JIT practices significantly reduce food spoilage, minimize operational costs, improve service speed, and enhance employee productivity. Supplier reliability emerged as the most critical factor influencing successful JIT implementation. The study also noted infrastructural and logistical challenges such as poor roads and erratic power supply as limiting factors. Based on these findings, the study recommends establishing long-term supplier partnerships, adopting hybrid cold storage solutions to mitigate power disruptions, forming cooperative purchasing hubs among restaurants, staff training in lean workflow techniques, and government support in improving road networks around food markets. The study concludes that JIT remains a viable strategy for enhancing performance in Warri’s fast food sector.

Keywords: JIT, JIT practices, Operational Performance, Selling, Local Fast Food Companies in Warri.

Introduction

The global fast-food industry has experienced significant growth over the past few decades, driven by factors like urbanization, changing consumer lifestyles, and the increasing number of working-class individuals. Nigeria is no exception, with the fast-food sector expanding rapidly, particularly in major cities like Warri. The industry is characterized by a mix of local and international brands, all competing for a growing customer base. However, this competitive environment, coupled with operational challenges, puts immense pressure on these businesses to optimize their processes. In this context, Just-in-Time (JIT) practices have emerged as a potential solution. JIT, a production and inventory management philosophy, aims to minimize waste by receiving and producing goods only when they are needed. While widely applied in manufacturing, its principles of reducing inventory, improving quality, and enhancing efficiency are highly relevant to the fast-paced, high-volume environment of a fast-food restaurant. For fast-food businesses in Warri, where supply chain disruptions and infrastructural issues

are common, the adoption of JIT could be a game-changer. By aligning ingredient inflow with actual customer demand, restaurants can minimize spoilage, lower storage costs, and improve the freshness of their offerings. This, in turn, can have a direct impact on their operational performance, which includes metrics like productivity, customer satisfaction, and profitability.

JIT, according to Dalci and Tanis (2006), is a production system that shortens lead times, lowers inventories, and enhances supplier relationships. Rapidly evolving market conditions and heightened rivalry in the industry, led fast food chains to implement Just-In-Time (JIT) as an effort to reduce their inventory levels and enhance customer service. Sing and Ahuja (2014), however, contended that JIT is a methodology that aims to eliminate waste and achieve precision in the production service process. According to Kinyua (2015), just-in-time (JIT) manufacturing enables businesses to produce goods in the proper quantity and quality with the least amount of resources. According to Phan et al. (2019), JIT is based on the ongoing pursuit of processes that increase the productivity and effectiveness of

performance operations. JIT's primary goal is to deliver products or services without wasting any resources. According to Ketokivi and Schroeder's (2004) analysis, some JIT applications are more likely to improve particular operational performance metrics. But according to Khairuddin et al. (2015), JIT requires a variety of techniques to achieve optimal performance and depends on more than just worker's effort, it also takes into account other environmental factors. Conversely, Sutrisno (2019) contended that operational performance characteristics, such as improved product and service quality, increased productivity, decreased costs associated with defects, shorter delivery times, effective product delivery, and inventory performance, significantly impact on the outcome of the process. The aims of this study is to highlight the importance of JIT practices with emphasis on JIT purchasing, JIT selling and JIT on performance such as quality, cost effectiveness, and quick service delivery.

Statement of the Problem

Despite the potential benefits of JIT, many fast-food restaurants in Warri metropolis face significant operational challenges that may hinder its successful implementation. The fast-food industry in Nigeria often deals with an unreliable supply chain, characterized by poor road networks, security challenges, and fluctuations in the availability and price of ingredients. These issues make it difficult to maintain the precise and consistent deliveries required for a successful JIT system. Building reliable supplier relationships is critical for JIT success. However, many restaurants in Warri face difficulties in establishing stable partnerships with suppliers, leading to inconsistencies in food quality and supply (Ukorebi, 2018). According to (USDA, 2022), poor infrastructure, particularly inconsistent power supply, is a major challenge. Restaurants rely heavily on electricity for refrigeration, cooking, and point-of-sale systems. Frequent power outages can disrupt operations and lead to food spoilage, making it risky to operate with minimal inventory as required by JIT. The fast-food industry in Warri, like in other parts of Nigeria, sees a high rate of business failures. Many new outlets open and close within a few years, suggesting an inability to maintain long-term survival strategies and efficient operations, (Onwuegbule, 2025). This highlights a critical gap in understanding how to improve operational performance and competitiveness.

Objectives of the Study

- The objectives of this study is to investigate:
- i. To ascertain the effect of instant service quality, cost, and delivery of local fast food restaurants in Warri metropolis.
 - ii. To evaluate the implementation of JIT practices and the operational performance in fast food restaurants

- iii. To determine how JIT operations improve productivity and enhance the performance of fast food restaurants.

Research Questions

In order to find answers to the problem under investigation, the following question were raised to guide the study.

- i. What is the influence of JIT practices on operational performance, quality, cost, and delivery on local fast food restaurants in Warri metropolis?
- ii. What is the influence of implementation of JIT practices on operational performance of fast food restaurants?
- iii. What is the effect of JIT operations in improving productivity and enhancing the performance of fast food restaurants in Warri metropolis?

Review of Related Literature

Conceptual framework:

Many scholars have x-strayed just-in-time (JIT) from various angles. Bartezzaghi and Turco (1989) distinguished JIT from two perspectives: first, as a universal approach, and secondly, as a collection of methods intended to continuously enhance production. JIT is a mindset that aims to reduce inventory in the manufacturing process in order to provide goods with high quality and excellent customer services (Clarke and Mia, 1993). While Bandyopadhyay (1995) postulated that the key to implementing Just-In-Time (JIT) effectively is to comprehend the intended objectives and that top management bears responsibility for employees' involvement.

According to Kootanaee, et. al. (2013) argued that JIT is a concept of production that tends to minimize inventories through creating a pull system in which each component of these systems pulls the other to deliver with high level of quality and quantity.

In the light of this, Phan et al. (2019) clarified that JIT approaches improve customer service, boost process implementation and execution, quality, and enable effective communication. JIT, in the opinion of Al-Haraisa (2017), posited that JIT is a method or strategy based on prearranged actions meant to gain a competitive edge and reduce production waste.

Drawing an overview of JIT, which the fast-food companies adopted, is possibly based on the definitions given above. JIT is an approach that focuses on producing stable items in a salable quantity with good quality through a pulling system, with the goal of creating an operational performance with zero defect or minimal waste. It is noteworthy to state that this kind of technique can be used in selling, buying, and operating fast food restaurants.

Just-in-Time Practices:

Numerous studies have demonstrated that JIT techniques can be successful when applied correctly. For example, JIT can be used in operations, purchasing, and selling when it is tailored to the specific company context. Green et al. (2011), posited that implementing JIT selling can only result in improved performance if integrated control is applied to the entire process. Chanda (2017) opined that JIT techniques can help the production process so that the manager can raise operational performance to a desired or superior level. Also, Pérez and Torres (2019) argued that in order to apply JIT, it is necessary to consider the quality level, which is most likely to be improved upon over times especially in JIT purchasing.

JIT Purchasing:

According to Singh and Ahuja (2014), stated that JIT purchasing is a system that stands on purchasing of materials based on the actual and urgent needs to fulfill the urgent demands of the clients with zero waste and minimum inventory cost. Based on this, we can say that implementing such system leads to reducing the amount of money needed to buy materials and the cost of storage. Mazanai (2012), argued that purchasing procedures support the creation of long-term agreements and contracts for the location of facilities. JIT purchasing strategies are intended to be utilized to reduction of inventory, boost buyer-supplier confidence to increase production levels, and decrease production waste, Phogat and Gupta (2018). It's interesting to note that JIT purchasing is defined by Pérez and Torres (2019) as a process that, via increased quality and flexibility, fosters long-term, trust-based coordination between the buyer and the suppliers. Stated differently, suppliers and purchasers will become reliant on one another's companies as a result of frequent logistics arising from simpler and smaller deliveries.

JIT Operation:

Researchers have not yet come to a consensus on a single definition of JIT operation, but according to Chanda (2017), the fundamental goal of just-in-time (JIT) operation and management is to eliminate waste while adopting business procedures to create an efficient system. Such a strategy is based on providing customers with high-quality products at the most affordable price while still meeting their desires. To achieve these kinds of outcomes, JIT must be correctly implemented in the operations of business. In this regard, Ganiyu, et al. (2019) noted three essential components; a correct mindset, ongoing improvement, and staff involvement are critical to the concept's success. These elements together target the company's performance towards being more efficient which in turn affects the company's change culture.

According to Bortolotti et al. (2013), Just-in-Time (JIT) technologies facilitate production operations and aid organizations in avoiding excessive inventory. Given that

inventory expenses were very high at the middle of the 20th century, Toyota strove to keep them to a minimum. Toyota has developed an operational system based on just-in-time (JIT) and lean manufacturing, Dora et al. (2014). Furthermore, Phogat and Gupta (2018), emphasized that JIT enables the restaurant to determine whether a task takes longer than anticipated or to identify any malfunctioning system components.

Ho (1995), opined that McDonald's is the only major fast-food business that employs just-in-time (JIT) processes to provide everyday customer service. According to Molashkhia (2014), McDonald's typically operates under a system that makes sure all necessary materials and procedures are available when needed and are taken into account on time. In order to ensure that their customers always receive the same order with fresh ingredients at equal levels of quality, Patel et al. (2016) stated that McDonald begin assembling their burgers in a standardized procedure in collaboration with their suppliers.

Customer satisfaction

In the context of fast-food restaurants, Just-in-Time (JIT) practices are directly linked to customer satisfaction by improving key aspects of the dining experience, such as food quality and speed of service. JIT principles, when applied effectively, address fundamental customer expectations. JIT practices significantly influence customer satisfaction in the fast-food industry. The core philosophy of JIT is to eliminate waste and produce only what is needed, when it is needed. This translates into several direct benefits for customers such as improved food quality and freshness, reduced waiting and service time and enhanced menu consistency

Adopting this strategy results in devoted clients. When customers place an order, they know exactly what to expect - fresh food that tastes well and is prepared more freshly. Customers become satisfied enough to place additional orders as a result. Client Relationship Management arose from corporate procedures such as relationship marketing (RM) and the focus on boosting customer retention through efficient customer relationship management (Wang & Feng, 2012). A streamlined production process and efficient inventory management enable fast - food restaurants to serve customers more quickly. This is especially important in a fast - paced environment like Warri Metropolis, where customers often have limited time. A study by Parasuraman et al. (2019) shows that fast service is a critical factor in customer satisfaction in the service industry.

JIT Selling

The concept of JIT selling is an extension of the JIT philosophy to the sales and customer service process. It's about providing the right product to the customer at the right time, based on their specific needs and demands. In fast-food, JIT selling is a more modern, customer-centric approach that goes beyond just the production line. JIT selling focuses on real-time responsiveness to customer

orders. This means the system is designed to "pull" items from production as soon as the customer places an order. JIT selling allows for greater flexibility. Since products aren't mass-produced in advance, fast-food restaurants can more easily accommodate customer requests for customizations, such as "no onions" or "extra cheese," without disrupting the entire flow. This personalized service makes customers feel valued and improves their overall experience.

Modern JIT selling in fast-food is often facilitated by technology. Online ordering systems, mobile apps, and in-store kiosks act as the "pull" signal, sending orders directly to the kitchen staff. This integration reduces errors and speeds up the entire process, creating a seamless and satisfying customer journey from order placement to pick up. In the competitive market, where customers have many options, the ability of a fast-food restaurant to provide high-quality, fresh food quickly and consistently, as enabled by JIT practices and selling, is a key differentiator. It directly impacts customer satisfaction, leading to repeat business and positive word-of-mouth, which are vital for long-term survival and profitability (Ndubisi & Nwankwo, 2019; Anifowose & Olaleye, 2016).

Implementation of JIT in Warri Metropolis, Delta State

The adoption of JIT practices among fast food restaurants reflects the broader trend in Nigeria towards efficiency in the food service sector. The study by Ali (2024) highlights how local establishments have integrated JIT practices to enhance their operational capabilities. Research indicated that many restaurants in Delta Stat have started focusing on local sourcing of ingredients to better control inventory levels and reduce lead times (Ali, 2024). A growing trend is also the implementation of technology for real-time inventory tracking, helping managers make informed purchasing decisions (Ganiyu, 2019). Implementing JIT allows fast food outlets to operate leaner, reducing costs associated with excess inventory.

A study highlighted that restaurants applying JIT saw a reduction in operating costs by up to 20% (Ali, 2024). With a focus on fresh ingredients, restaurants can ensure higher quality products, leading to increased customer satisfaction. Continuous improvement in food quality was noted in establishments that adopted JIT practices (Al-Janabi, 2020). JIT enables restaurants to respond effectively to changing consumer preferences. By analyzing sales data in real-time, management can adapt their offerings, reducing waste and better meeting customer demands (Ali, 2024).

Operational performance

The areas of performance that the business strives to enhance in order to fulfill its plan are known as operating performance goals. According to Sengul et al. (2015), the organization would establish the pertinent operational performance goals to measure and configure the environment in order to facilitate the achievement of the

goals after defining the company's strategy. According to Gabčánová (2012), it is essential to document, track, and evaluate many facets of operational performance in order to guarantee optimal distribution of resources in operations. Finding the right performance metrics for internal and external elements that affect an organization's competitiveness is the primary responsibility of this procedure (Gustafsson and Frost, 2018). Reliance on conventional financial indicators only has become insufficient, because performance measurement and evaluation are necessary, and they are one of the main elements of the success of the establishment (Şengül, et. al., 2015). In light of rapid development and according to Gabčánová (2012) key performance indicators include, customer satisfaction, new product development, quality of the product/service, productivity, efficiency and profitability, Pekuri et al. (2011). Just-In-Time practices within fast food restaurants has made significant strides, leading to enhanced operational performance characterized by increased efficiency and reduced costs.

Theoretical Review

For the resolves of this research, the research was directed by Transactional Cost Analysis Theory (1981) and Queuing Theory.

Transactional Cost Analysis Theory

Overview of Transactional Cost Analysis (TCA), proposed by Ronald Coase and further developed by Oliver Williamson, focuses on the costs incurred during economic exchanges. It emphasizes the importance of minimizing transaction costs to enhance efficiency in operations (Williamson, 1981). Within JIT systems, transaction cost considerations influence purchasing, supplier relationships, and inventory management. JIT necessitates the establishment of collaborative relationships with suppliers to ensure timely delivery of ingredients. High transaction costs associated with negotiating contracts, monitoring performance, and enforcing agreements can deter the effective implementation of JIT (Williamson, 1998). Fast food restaurants in Warri, by minimizing these costs through long-term partnerships with local suppliers, can foster a more efficient supply chain, reducing inventory holding costs and ensuring fresh produce availability.

JIT practices impacts inventory management significantly by advocating for reduced stock levels and timely replenishment. Transaction costs related to inventory holding, such as storage costs and obsolescence risks, are minimized when restaurants order ingredients as needed. This is vital in a locale where perishable items are prominent, helping reduce waste and associated costs (Ali, 2024). The integration of TCA principles allows restaurants in Warri to enhance their operational performance. Streamlined supplier negotiations and minimized inventory-related costs contribute to lower operating expenses, thereby improving profitability (Alhassan & Otoo, 2021).

Queuing Theory

Queuing Theory analyzes waiting lines or queues to understand customer service processes and optimize system performance (Little, 1961). In fast food restaurants, effective queuing mechanics ensure swift service, which is crucial in high-demand environments. JIT implementation aligns with minimizing wait times and optimizing service delivery. By synchronizing food preparation with incoming orders, fast food restaurants can ensure that customers receive their orders promptly, a critical factor affecting customer satisfaction (Bitran & Mondschein, 1997). Efficient service leads to reduced queue lengths, enhancing the overall dining experience.

Queuing theory also aids in better understanding server capacities and customer arrival rates. Fast food restaurants in Warri, apply queuing models to forecast peak service times, allowing them to allocate human resources effectively and adjust staffing levels accordingly (Schmidt & Möller, 2006). This proactive approach ensures that service quality remains high during busy periods, a common challenge in the fast food sector. Implementing insights from queuing theory enhances the customer experience and improves turnover rates, essential for profitability in the competitive fast food landscape. Fast food outlets that leverage this theory are better positioned to accommodate customer demands without compromising service quality (Ganiyu, 2019).

Empirical Review

Rashid et al, (2024) study the impact of just-in-time practices on the operational performance of global fast-food brands in Karachi, Pakistan. The sample size of 300 respondents was taken from the global supply chain management professionals at the global fast-food restaurant supply chain through the non-probability purposive sampling technique. For the constructs' items through reliability and regression analysis, examine the relationship between the independent and the dependent variables of the test hypotheses in the research study. The results indicate that Just-In-Time significantly and positively influences the operational and competitive performance in the restaurants of global fast-food brands.

Agu et al. (2016) posited that an investigation to discover the degree at which inventory control influence the profitability of some manufacturing firms concluded that inventory control essentially influences efficiency of manufacturing firms. As indicated by the results of the analysis, there is a positive relationship between demand management and customer satisfaction in manufacturing firms, Just-in-time has a significant effect on growth of the firms. The instrument utilized for data collection was basically questionnaires and interviews.

Chien and Lin (2015) study titled: "The Effects of the Service Environment on Perceived Waiting Time and Emotions" aimed to test customer's mood and define which

environmental factor may supply the most support in decreasing the sense waiting time and the passionate response. Descriptive approach was used. The sample of the study consisted of (410) customers who favored burger restaurants during traffic hour and who were suspense for their meal or were in the operation of dispatching their order. The result of this study revealed that the impact of understood traffic on the understood waiting time path seems to be stronger than emotional path. For that the strategy to minimize the perception of rush is to inspire the customers feel that their understood waiting time is decreased.

Green, et. al. (2014) study titled "Total Just in Time Impact on Supply Chain Competency and Organizational Performance" aimed to study the relationship between supply chain and total JIT on organizational performance that depends on number of elements (JIT purchasing, JIT selling, JIT and JIT information). Data collected from number of experts (managers, and plant) based on traditional mailing by use the covariance-based structural. Results shows that there is a positive impact between total JIT and supply chain and organizational performance, but the success of supply chain needs a supply chain strategy. Study recommended the future researcher to investigate the impact of each element on performance.

Furlan, et. al. (2011) study titled "On the complementarity between internal and external just-in-time bundles to build and sustain high performance manufacturing" aimed to study the complementarity of internal JIT upstream (suppliers) and external downstream (customer). The authors used questionnaire on 266 manufacturing in nine countries, by send questions to 10 of random managers, 2 supervisors, and 100 employees, to test the hypothesis based on third round of the high-performance manufacturing. The study found that is so important to have correlation between upstream and downstream to achieve maximum operation performance. The recommended is extended to other internal and external JIT bundles like (TQM, and human resource management).

Green, et. al. (2007) study titled "The Impact of JIT-11-Selling on Organizational Performance" aimed to study the influence of JIT selling on organizational performance depends on production and marketing function. Data collect from 166 directors of large companies, and data analyzed based on structural equation approach. The study concluded that there is an effective impact of JIT selling on performance. The study recommended to seeking for suppliers to achieve long-term relationship and effective implement of JIT selling.

Barlow (2002) study titled "Just in time: Implementation within the Hotel Industry" aimed to investigate the value of JIT purchasing and inventory on hotel sector. Data collected based on case study of three different types of hotels. The result showed that implement of JIT purchasing and inventory has a positive impact on hotel sector. The author

recommended studying the benefits of JIT in short term such as return on capital employed.

Methodology

This study adopted a descriptive survey research design, as it enabled the researcher to gather quantitative data on Just-In-Time (JIT) practices and operational performance of fast food restaurants in Warri metropolis. The population of the study comprised employees of selected registered fast food outlets within Warri, estimated at approximately 950 staff. A stratified random sampling technique was employed to ensure fair representation of managers, supervisors, chefs, and service staff. Using the Taro Yamane formula at a 5% margin of error, a sample size of 279 respondents was selected. Primary data were collected through structured

questionnaires designed on a five-point Likert scale to measure perceptions on JIT practices, cost, quality, delivery, and productivity. The study variables were operationalized by adapting validated items from prior JIT and operational performance studies. Content validity was established by expert review, while reliability was confirmed using Cronbach's Alpha, with coefficients above 0.70 considered acceptable. Data were analyzed using descriptive statistics (frequency and percentage) for demographic information and mean scores for responses. Inferential statistics, including regression analysis, were employed to test the effect of JIT practices on operational performance. Ethical considerations such as informed consent, confidentiality of responses, and voluntary participation were strictly observed throughout the study.

Presentation of Data

Table 1: Demographic Characteristics of Respondents (N = 279)

Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	158	56.6%
	Female	121	43.4%
Age	18–25 years	72	25.8%
	26–35 years	118	42.3%
	36–45 years	63	22.6%
	46 years & above	26	9.3%
Position	Manager	32	11.5%
	Supervisor	48	17.2%
	Chef	55	19.7%
	Service Staff	119	42.7%
	Others	25	9.0%
Years of Experience	Less than 1 year	41	14.7%
	1–3 years	96	34.4%

	4–6 years	84	30.1%
	Above 6 years	58	20.8%
Type of Restaurant	Small-sized	112	40.1%
	Medium-sized	97	34.8%
	Large chain	70	25.1%

Table 1 presents the demographic characteristics of respondents from selected fast food restaurants in Warri metropolis, Delta State, Nigeria. Out of the 279 respondents, 158 (56.6%) were male while 121 (43.4%) were female, indicating that the fast food industry in Warri metropolis is slightly dominated by male employees. In terms of age distribution, the majority of the respondents, 118 (42.3%), were between 26–35 years, followed by 72 (25.8%) within the 18–25 years category. About 63 respondents (22.6%) fell within 36–45 years, while only 26 respondents (9.3%) were aged 46 years and above. This suggests that the workforce in the industry is largely youthful and within the productive age bracket.

Regarding job positions, the majority of the respondents, 119 (42.7%), were service staff, while 55 (19.7%) were chefs. Supervisors accounted for 48 (17.2%), managers

constituted 32 (11.5%), and 25 respondents (9.0%) were categorized as others. This distribution indicates that frontline service staff form the bulk of the workforce in fast food restaurants. Analysis of years of experience shows that 96 respondents (34.4%) had between 1–3 years of work experience, followed by 84 (30.1%) with 4–6 years. Those with more than 6 years of experience were 58 (20.8%), while 41 respondents (14.7%) had less than one year of experience. This suggests that most employees in the industry are relatively new but also have significant representation of moderately experienced staff. In terms of restaurant type, 112 (40.1%) were employed in small-sized fast food restaurants, 97 (34.8%) in medium-sized restaurants, and 70 (25.1%) in large chain restaurants. This shows that small and medium-sized restaurants dominate the fast food landscape in Warri metropolis.

Table 2: Respondents' Perception on JIT Practices and Operational Performance

S/N	Statement	SD (1)	D (2)	N (3)	A (4)	SA (5)	Mean	Remark
1	Our restaurant practices Just-In-Time in inventory management.	18	34	46	108	73	3.71	Agreed
2	JIT reduces food wastage and spoilage.	12	28	39	121	79	3.92	Agreed
3	JIT has helped to cut down operational costs.	22	31	52	105	69	3.72	Agreed
4	JIT improves service speed and reliability in meeting customer orders.	14	24	40	118	83	3.95	Agreed
5	Supplier reliability is critical to the success of JIT practices.	10	20	36	115	98	4.11	Strongly Agreed
6	Challenges in JIT implementation negatively affect operational outcomes.	16	29	45	111	78	3.86	Agreed

Source: Field Survey, 2025

Table 2 shows respondents' opinions on the effect of Just-In-Time practices on the operational performance of fast food restaurants in Warri metropolis. The findings reveal that the majority of respondents agreed that their restaurants practice JIT in inventory management, with a mean score of 3.71. Respondents strongly affirmed that JIT reduces food wastage and spoilage (Mean = 3.92) and contributes to cost reduction (Mean = 3.72). On service delivery, respondents

agreed that JIT enhances speed and reliability in customer order processing (Mean = 3.95). Furthermore, supplier reliability was highlighted as a critical success factor for JIT practices, with the highest mean score of 4.11, suggesting that the efficiency of JIT operations is highly dependent on timely and consistent supplier performance. Respondents also agreed that challenges in JIT implementation negatively affect operational performance (Mean = 3.86).

Table 3: Respondents' Perception on JIT Operations, Productivity, and Performance

S/N	Statement	SD (1)	D (2)	N (3)	A (4)	SA (5)	Mean	Remark
1	JIT practices help to improve employee productivity in the restaurant.	15	28	42	124	70	3.88	Agreed
2	JIT contributes to better time management and workflow efficiency.	12	24	37	119	87	3.98	Agreed
3	The adoption of JIT practices has enhanced overall restaurant performance.	18	27	40	113	81	3.91	Agreed
4	JIT leads to faster turnaround time in processing customer orders.	11	23	35	116	94	4.01	Agreed
5	The restaurant's competitiveness has improved due to JIT operations.	16	30	41	115	77	3.88	Agreed
6	JIT contributes to sustainable performance in the fast food industry.	14	26	38	118	83	3.95	Agreed

Source: Field Survey, 2025

Table 3 presents respondents' opinions on the effect of JIT operations on productivity and performance of fast food restaurants in Warri metropolis. The results show high levels of agreement across all statements. Respondents affirmed that JIT practices improve employee productivity (Mean = 3.88) and contribute to better time management and workflow efficiency (Mean = 3.98). Similarly, JIT was perceived to enhance overall restaurant performance (Mean = 3.91) and facilitate faster turnaround time in processing customer orders, which had the highest mean score (4.01). Respondents also agreed that JIT enhances competitiveness (Mean = 3.88) and contributes to sustainable performance in the fast food industry (Mean = 3.95).

Discussion of Findings

The demographic findings provide useful insights into the structure of the fast food industry workforce in Warri metropolis. The slight male dominance suggests that certain operational tasks, possibly involving physical demands and extended working hours, may attract more male employees. However, the high proportion of female staff also highlights gender inclusiveness in the sector, especially in customer service roles. The age distribution reflects a youthful workforce, consistent with the fast-paced and labor-intensive nature of the industry. Younger employees are more likely to adapt to Just-In-Time (JIT) practices, which require speed, flexibility, and efficiency in service delivery. This aligns with prior studies that associate JIT success with an energetic and adaptable workforce. The high percentage of service staff (42.7%) underscores the customer-centric orientation of fast food restaurants. Since service staff directly interact with customers, their role is critical in ensuring service quality, prompt delivery, and cost efficiency, which are key dimensions of JIT practices.

The predominance of respondents with 1–3 years and 4–6 years of experience suggests a moderately experienced workforce, which can balance adaptability with accumulated industry knowledge. Such a workforce is vital for sustaining JIT operations, as employees with some experience are better positioned to handle the demands of inventory control, waste reduction, and timely service delivery. Finally, the dominance of small and medium-sized restaurants (74.9%) indicates that the implementation of JIT practices in Warri metropolis may vary across different business scales. Smaller restaurants may face challenges of limited supplier networks and resources, while larger chains may have structured systems for operational performance. Nevertheless, the widespread presence of smaller outlets suggests that any analysis of JIT effectiveness must consider the peculiarities of resource-constrained settings.

The effect of instant service quality, cost, and delivery of local fast food restaurants in Warri metropolis

The findings from Table 2 indicate that JIT practices are actively recognized and applied within the fast food industry in Warri metropolis. This supports earlier studies that emphasize the role of JIT in minimizing waste, reducing costs, and improving service efficiency in the hospitality sector. The relatively high agreement levels across items show that employees perceive JIT as a strategy that positively impacts operational performance. Specifically, the high mean score on supplier reliability (4.11) suggests that external factors, such as the dependability of supply chains, play a pivotal role in ensuring the success of JIT systems. This aligns with the principle of JIT, which requires synchronized and timely supply of raw materials to support smooth operations.

Moreover, the agreement that JIT reduces food spoilage and enhances speed in service delivery shows

its direct relevance to customer satisfaction—an essential factor in the competitive fast food industry. However, respondents also recognized that challenges in JIT implementation can negatively affect operational outcomes, reflecting the fact that without proper planning, JIT may expose restaurants to risks such as supply delays and stock-outs. The study revealed challenges in JIT implementation, particularly with supplier reliability, which respondents ranked as a critical determinant of success. This finding differs somewhat from Furlan et al. (2011), who emphasized the complementarity of upstream supplier integration and downstream customer satisfaction in achieving high operational performance. In the Warri context, unreliable supply chains, frequent power outages, and infrastructural deficiencies hinder seamless JIT adoption. These challenges are socio-economically rooted, as many local suppliers operate informally and lack logistics efficiency, creating risks of stockouts and delays. In summary, the findings stresses that JIT practices, when effectively implemented, contribute to cost efficiency, improved productivity, and better service performance in fast food restaurants in Warri metropolis.

The implementation of JIT practices on the operational performance and productivity of fast food restaurants.

The findings from Table 3 clearly suggest that JIT operations significantly influence productivity and performance outcomes in fast food restaurants. The respondents recognized that JIT helps streamline workflow and improve time management, which is critical in the fast-paced nature of food service. This finding aligns with the JIT philosophy that emphasizes waste reduction, efficiency, and responsiveness to customer demand. The highest-rated statement—that JIT leads to faster turnaround time in customer order processing (Mean = 4.01)—highlights the direct impact of JIT on customer satisfaction. In the hospitality industry, service speed is a major competitive factor, and JIT enables restaurants to respond swiftly to fluctuating demand without compromising quality.

Furthermore, the findings that JIT contributes to competitiveness (Mean = 3.88) and sustainability (Mean = 3.95) show that restaurants that adopt JIT practices are better positioned to maintain long-term operational performance and remain resilient in a highly competitive market like Warri metropolis. The implications of these findings are multifaceted. First, they demonstrate that JIT is a viable operational strategy for fast food restaurants in Warri, capable of improving customer satisfaction through reduced waiting time and improved quality of service. The results of this study reveal that Just-In-Time (JIT) practices positively influence operational performance

in fast food restaurants in Warri metropolis. Respondents affirmed that JIT reduces food spoilage, minimizes costs, improves employee productivity, and enhances service delivery speed. These findings align with Belekoukias et al. (2014), who observed that JIT and automation significantly improve efficiency in manufacturing organizations, particularly in areas of cost, quality, and delivery. Similarly, Agu et al. (2016) reported that JIT has a significant effect on firm growth and efficiency, which resonates with this study's findings that JIT contributes to competitiveness and sustainability in the fast food sector. This agrees with Chien and Lin (2015), who highlighted the importance of minimizing perceived waiting time in food service settings. Second, the findings stress that without robust supplier networks and infrastructural support, JIT's potential cannot be fully realized. This echoes Green et al. (2014), who argued that the success of JIT depends on supply chain strategies. The results suggest that while JIT enhances performance in Warri's fast food industry, full optimization requires addressing local infrastructural, supply, and cultural challenges. Overall, these findings reinforce the argument that JIT operations not only enhance internal efficiency but also provide strategic advantages by boosting productivity, improving customer service, and sustaining competitiveness in the fast food industry.

Conclusion and Policy/Managerial Implications

This study, titled *Just-In-Time Practices and Operational Performance of Fast Food Restaurants in Warri Metropolis, Delta State, Nigeria*, investigated how JIT influences service quality, cost, delivery, and productivity. The objectives were to evaluate JIT adoption, its effect on operational performance, and its role in enhancing productivity. Findings revealed that JIT reduces waste, cuts costs, improves workflow efficiency, and strengthens competitiveness. However, unreliable suppliers, poor infrastructure, and unstable electricity supply remain key barriers to full implementation.

Policy and Managerial Implications

1. **Supplier Partnerships** – Fast food operators should sign long-term supply agreements with Warri-based farmers and distributors to ensure timely delivery and reduce dependence on inconsistent markets.
2. **Energy Solutions** – Managers should adopt hybrid energy (solar + generator backup) to power cold storage and maintain JIT efficiency despite frequent outages.
3. **Joint Procurement Hubs** – Policymakers can support restaurant clusters to form cooperative

purchasing hubs in Warri, reducing logistics cost and increasing supplier accountability.

4. **Staff Capacity Development** – Owners should introduce lean-service training workshops tailored to peak traffic periods (e.g., lunch rush) to strengthen workflow under JIT.
5. **Infrastructure Support** – Local government should prioritize rehabilitating feeder roads around Warri's major food markets (Igbudu, Effurun) to improve supply chain reliability.

Digital Forensic tools and the Performance of Small and Medium Enterprises in Delta State, Nigeria

EGBERI, Edith, Onyeyime

Department of Entrepreneurship,
Faculty of Administration and Management,
Southern Delta University, Ozoro

Abstract

Small and medium-sized enterprises are vital contributors to economic growth, poverty reduction and employment generation in Nigeria; however, these enterprises are highly vulnerable to fraud, financial irregularities and operational inefficiencies due to weak internal controls and limited resources. In recent times, digital forensic tools have emerged as innovative solutions for detecting, preventing, and mitigating fraudulent practices within organizations. Despite their growing relevance, adoption and effectiveness of such tools in improving the performance of small and medium-sized enterprises in Delta State, Nigeria remain underexplored. This study therefore investigates the effectiveness of digital forensic tools in enhancing the performance of small and medium-sized enterprises in Delta State which constitute population of the study. The study employed a descriptive survey design, by administering questionnaire to 214 accountants in different categories of SMEs in Delta State. Data obtained were analyzed using regression and findings revealed a significant positive relationship between digital forensic tools, financial accountability, internal control, and financial performance of SMEs in Delta State. It thus means that the adoption of digital forensic tools can enable small and medium-sized enterprises' detect fraud, ensure financial accountability and improve their overall performance. The implication of the finding is that small and medium-sized enterprises that effectively utilize digital forensic tools report better decision-making, enhanced internal controls, and increased stakeholder confidence compared to those without adoption of digital forensic tool. The study concludes that digital forensic tools are critical enablers of fraud prevention and performance improvement of small and medium-sized enterprises. The study recommends increased investments in digital forensic technologies, capacity-building for accountants, and policy interventions to support small and medium-sized enterprises in adopting cost-effective forensic solutions.

Keyword: Digital forensic tools, Small and medium-sized enterprises; Fraud detection; Internal control; Financial accountability; Performance

Introduction

Small and Medium-sized Enterprises (SMEs) play a critical role in driving economic growth, job creation, and innovation in Nigeria (SMEDAN, 2022). Despite their importance, SMEs in Delta State face persistent challenges of fraud, weak internal controls, and financial mismanagement, which hinder sustainable performance (Okoye & Gbegi, 2013; Abeki, 2023). The increasing complexity of financial crimes has necessitated the adoption of digital forensic tools to enhance fraud detection and accountability (Kranacher, Riley, & Wells, 2019; Akande, Benjamin & Umukoro, 2024). However, the extent to which these tools improve SMEs' performance in developing economies remains underexplored (Akinyomi, 2021). This study therefore investigates the effectiveness of digital forensic tools in enhancing the performance of SMEs in Delta State, Nigeria. Digital forensic serves as an intelligence tool and systematic procedure to examine digital records by uncovering financial irregularities

while at the same time, maintaining professional and ethical standards (Amahi, 2023; Aminat, Ezekiel & Obafemi, 2023). Digital forensic in the context of SMEs refers to the investigative process carried out when financial fraud, data breaches, or irregularities occur within their digital systems and networks.

SMEs often lack strong internal control systems, making them prime targets for financial manipulation and data breaches (Bierstaker et al., 2006). To address these challenges, digital forensic tools have emerged as essential instruments for detecting, preserving, and analyzing electronic evidence in a legally admissible manner (Casey, 2011). Such tools are particularly useful in uncovering concealed transactions, unauthorized modifications, and fraudulent activities within SME accounting systems (Nigrini, 2020). SMEs often face strict compliance requirements in fraud prevention and data protection. Digital forensic tools support regulatory compliance by preserving electronic evidence and monitoring financial activities (Ogwiji, 2023; Ubesie, Ibezim & Cyriacus, 2023). This reduces

exposure to fines, penalties, and litigation, contributing to improved financial performance (Horsman, 2019). Most studies on use on digital fraud tools focus on large corporations, banks or public sector sectors organizations leaving a gap in understanding how digital forensic tools affect SMEs performance in specific regions like Delta State. Forensic examiners rely on a variety of tools to analyze evidence collected at a crime scene, with the choice of tool depending on the type of digital forensics being conducted, such as mobile, network, or database forensics. This study focused on how digital forensic tools can be used by SMEs to strengthen financial reporting credibility and reduce the risks of error and fraud.

Objectives of the Study

This study investigates the effect of digital forensic tools on small and medium-sized enterprises' performance in Delta State. On the basis of the above, the following were the specific objectives of the study:

- (i) To determine whether digital forensic tools improve financial accountability of SMEs in Delta State.
- (ii) To ascertain whether digital forensic tools enhance internal control of SMEs in Delta State.
- (iii) To examine the effect of digital forensic tools on financial performance of SMEs in Delta State

Review of Related Literature

Small and Medium-sized Enterprises (SMEs) and Digital Forensic Tools

Small and Medium-sized Enterprises (SMEs) are often considered the foundation of developing economies, playing a vital role in their overall growth and contribution to employment creation, innovation, and aggregate gross domestic product (GDP). In Nigeria, SMEs account for over 90% of businesses and employ a large portion of the workforce (SMEDAN, 2022). Despite their importance, SMEs face challenges such as weak financial management, susceptibility to fraud, and limited adoption of advanced/improved technologies. Fraudulent practices - including financial statement manipulation, payroll fraud, and asset misappropriation have been reported as common threats to SME sustainability (Okoye & Gbegi, 2013; Ubesie, Ibezim & Cyriacus, 2023).

On the other hand, digital forensic tools are technological applications designed to collect, preserve, analyze, and interpret electronic data for use in detecting and preventing fraud or other financial irregularities (Victory, Promise & Mike, 2022). Examples include data mining software, forensic accounting applications, enterprise resource planning (ERP) audit modules, and AI-driven fraud detection

systems. These tools allow accountants and auditors to trace suspicious transactions, identify anomalies, and ensure compliance with regulatory frameworks (Kranacher et al., 2019; Kranacher, 2021). For SMEs, adoption of such tools can provide transparency, build investor confidence, and improve decision-making.

Digital forensics tools have allowed for fast and reliable data acquisition and analysis, which is imperative in a world where information can disappear quickly (Crane, 2013; Agboare, 2021). The digital forensic tools used by SMEs are designed to maintain the integrity of digital evidence while ensuring accuracy and repeatability of findings (Carrier, 2005). In business and accounting contexts, digital forensic tools are increasingly applied to detect fraud, unauthorized data manipulation, and financial irregularities (Nigrini, 2020, Adesina, et al, 2020). Computer forensics developed as a response to the growing incidence of crimes involving computer systems—whether as the target of the crime, a tool used to perpetrate it, or a storage medium for evidence related to criminal activities (Baryamureeba & Tushabe, 2004; Agarwal, et al, 2011; Adam, Zakari Bello, 2023).

Digital Forensic Tools and SMEs' Performance

Performance in SMEs can be measured from both financial and non-financial perspectives. Financial indicators include profitability, revenue growth, and return on investment, while non-financial indicators include employee productivity, customer satisfaction, and internal process efficiency (Madu-Chima, Egbunike & Okoro, 2020). Recent studies suggest that technology adoption such as digital forensic tools has the potential to enhance SME performance by strengthening internal control systems, reducing fraud losses, and promoting accountability (Akinyomi, 2021). In Nigerian businesses, digital forensic tools mirror those utilized globally, encompassing commercial solutions such as Cellebrite, Magnet AXIOM, EnCase, and FTK Imager, as well as open-source alternatives like Autopsy, The Sleuth Kit, and Wireshark. These tools play a critical role in diverse applications, including fraud detection, investigations of intellectual property theft, and ensuring compliance with regulatory standards across financial institutions and corporate entities.

A study on South African SMEs emphasizes the need for digital forensic readiness, where organizational characteristics such as IT skills, available funds, size, and public profile influence readiness strategies. The research notes that optimizing digital forensic readiness is crucial, as smaller organizations are particularly vulnerable to criminal incidents that can threaten their survival. This underscores how forensic preparedness can protect SME performance and continuity. SMEs that employ forensic tools are better equipped to

comply with regulatory requirements, reducing the risk of penalties and reputational damage (Adebisi & Gbegi, 2013). Adopting forensic technologies signals transparency and reliability, which strengthens the reputation of SMEs. A positive reputation not only attracts customers but also fosters partnerships and investment opportunities, improving market competitiveness (Aderibigbe & Bala, 2021).

Furthermore, digital forensic tools help SMEs identify operational inefficiencies caused by data manipulation or cyber threats, allowing management to implement corrective strategies (Casey, 2011). Their use also minimizes downtime from cyber attacks by enabling rapid response and evidence recovery (Agarwal et al., 2011). As a result, business continuity is maintained, ensuring stable revenue generation. Digital forensic provides SMEs with investigative capacity that supports transparency and enhances trust among stakeholders and customers. Ultimately, the integration of forensic tools empowers SMEs to balance growth objectives with the need for robust fraud detection and risk management. Overall, digital forensic tools enhance the accuracy, speed, and reliability of fraud detection in organizations.

Digital forensics assists businesses in responding to financial and cyber-related incidents by minimizing losses and facilitating recovery. Through the examination of compromised accounting and operational systems, organizations can identify weaknesses and implement stronger internal controls. In Nigeria, where cases of fraud and digital crimes affecting enterprises continue to increase, the adoption of effective digital forensic practices has become essential for safeguarding business performance and sustainability.

Theoretical Underpinning

This study was anchored on the Fraud Triangle Theory as advocated by Cressey in 1953 (cited by Oyedokun (2020). The fraud triangle theory explains that fraud occurs when three factors coexist: pressure, opportunity, and rationalization. Digital forensic tools reduce the *opportunity* element by strengthening, monitoring and detection mechanisms in SMEs. Forensic accountants are skilled in detecting and

preventing fraud by strengthening internal control systems, performing comprehensive audits, and analyzing financial records to uncover irregularities or anomalies that could signal fraudulent practices. By reducing opportunities for fraud, forensic accountants help to prevent instances of corruption and bribery within the private sector.

The relevance of the fraud triangle theory to this current study is that when fraudsters perceived opportunity to commit frauds, with the use of digital forensic tools the perceived opportunity by fraudsters to commit fraud can be reduced by way of monitoring, putting in place fraud detection mechanisms and by strengthening internal control measures. By so doing, internal controls, financial accountability and financial performance of SMEs can be enhanced.

Methodology

This study examined the effectiveness of digital forensic tools in improving the performance of SMEs in Delta State, Nigeria. The population comprises those operating in both the metropolitan and the non-metropolitan areas of Delta State. A structured questionnaire served as the primary research instrument and was administered to accountants drawn from each enterprise. Due to the large population of SMEs in Delta State, convenience sampling was employed to select 214 accountants, based on their accessibility. The questionnaire was designed to capture data on both the dependent variable (SMEs' financial accountability, internal control, and performance) and the independent variable (digital forensic tools).

Furthermore, to ensure the reliability of the instrument, it was administered to twenty-one (21) respondents, representing 10% of the sample size who are accountants employed in SMEs located in other states of the Nigerian federation. The pilot test results were assessed using Cronbach's Alpha, yielding coefficients of 0.86 for digital forensic tools, 0.88 for financial accountability, 0.81 for internal control and 0.78 for performance. Data collected were analyzed using descriptive statistics (frequency counts, simple percentages, mean, standard deviation, Pearson correlation) and inferential statistics (simple regression). The model of the study is given as follows:

$$\begin{array}{lll} \text{SMEFacc} & = (\text{Dftol}) & [\text{Eq. 1}] \\ \text{SMEIntcol} & = (\text{Dftol}) & [\text{Eq. 2}] \\ \text{SMEPerf} & = (\text{Dftol}) & [\text{Eq. 3}] \end{array}$$

Equations 1-3 are the implicit forms of the regression models showing the relationships between digital forensic tools, financial accountability, internal control and financial performance of SMEs. The explicit forms of the regression models were estimated as equations 4-6 as follows:

$$\text{SMEFacc} = \alpha_0 + \alpha_1 \text{Dftol}_i + \varepsilon_i \quad [\text{Eq. 4}]$$

$$\text{SMEIntcol} = \alpha_0 + \alpha_1 \text{Dftol}_i + \varepsilon_i \quad [\text{Eq. 5}]$$

$$\text{SMEPerf} = \alpha_0 + \alpha_1 \text{Dftol}_i + \varepsilon_i \quad [\text{Eq. 6}]$$

Where:

SMEFacc is financial accountability;

SMEIntcol is internal control;

Perf is performance;

SMEs is small and medium-sized enterprises;

α regression coefficient;

ε is error term

i is individual respondents.

Results

Table 1: Demographic Variables of Respondent

Ranks	Variable	Respondents	Frequency N= 214	Percentage (%)
1.	Gender	Male	169	80
		Female	45	20
		Total	214	100
2.	Age	21 – 30	12	06
		31 – 40	33	15
		41 – 50	121	57
		51 and above	48	22
		Total	214	100
3.	Marital Status	Single	37	17
		Married	177	83
		Total	214	100
4.	Category of Respondents	Chartered Accountants	67	31
		Management Accountants	15	07
		Auditors	93	44
		Forensic Accountants	39	18
		Total	214	100
5.	Service Years	5-10	82	38
		11- 15	108	51
		16 and above	24	11
		Total	214	100

Source: Compiled by the Researcher (2025)

Table 1 is the demographic variables of respondents; the result revealed that majority of the respondents representing 169(80%) were males while only 45(20%) were females. Also, it was found that majority of the respondents were within age brackets 41-50 representing 121(57%); this was accompanied by 51years and above, representing 48(22%), 31-40 years, representing 33(15%) and lastly, 21-30years, representing 12(6%). The marital status of respondents

revealed that majority of the respondents were married representing about 177(83%) while 37(17%) were single.

Furthermore it was found that majority of the sampled respondents were Auditors (internal and external auditors) representing 93(44%) and Chartered Accountants representing 67(31%) who are considered knowledgeable on issues of digital forensic tools. Finally, it was found that majority of the respondents

had worked with their SMEs for 11-15 of service years, representing 108(51%); this was accompanied by 5-10 of service years, representing 82(38%) while the

remaining respondents, 16years and above was represented by 24(115)

Table 2: Descriptive Results Perceived Digital Forensic Tool for Fraud Detection

	Fraud Detected	Fraud Not Detected	Total
Adopted (Yes)	121(56.2%)	45(20.9%)	166(77.1%)
Not Adopted (No)	23(10.9%)	25(11.9%)	48(22.9%)
Total	144(67.3%)	70(32.7%)	214 (100%)

Source: Compiled by the Researcher (2025)

Out of 214 SMEs, majority (77.1%) reported using digital forensic tools, while only 22.9% did not. Among those that used the tools, 72.9% (121 out of 166) detected fraud, while 27.1% did not detect fraud.

In contrast, among SMEs that did not use the tools, 47.9% (23 out of 48) detected fraud, while 52.1% did not detect fraud. Overall, across the sample, 67.3% of SMEs detected fraud while 32.7% did not detect fraud.

Table 3: Pearson Correlation

Variables	SMEFacc	SMEIntcol	SMEPerf	Dftol
SMEFacc	1.0000			
SMEIntcol	0.0221	1.0000		
SMEPerf	0.03311	0.0387	1.0000	
Dftol	0.0214	0.1049	0.2119	1.0000

Source: Compiled by the Researcher (2025)

The Pearson correlation results (Table 3) revealed that Pearson correlation coefficients showed positive relationship between digital forensic tools, financial accountability, internal control, and financial

performance of SMEs in Delta State. This means that there is positive relationship between digital forensic tools and financial accountability, internal control, as well as financial performance of SMEs in Delta State

Table 4: Regression Results for Digital Forensic Tools and Financial Accountability

Estimator	Predictors	t-value
R-Squared	0.5119	SMEFacc = 4.23
Adjusted R-Squared	0.5008	T-Probability = 0.000
F-Ratio	14.61	
Probability. F	0.000	

Source: Compiled by the Researcher (2025)

Table 4 is the regression result for digital forensic tools and financial accountability of the SMEs in Delta State. The regression results showed that R^2 is 0.5008; indicating that digital forensic tools explained about 51% of the systematic variation in financial accountability of the selected SMEs in Delta State.. Thus, the model of digital forensic tools and financial accountability offers a good fit to the dataset of the study.

The F-ratio is 14.61 and this suggests that digital forensic tools significantly influence financial accountability of the SMEs in Delta State. In addition, the t-value suggests that digital forensic tools positively significantly affect financial accountability of SMEs in

Delta State, Nigeria. This finding agrees with the results of Oyedokun (2020) and Popoola, et al (2019) who found significant influence of forensic tools on fraud detection, controls and performance of companies.

Table 5: Regression Results for Digital Forensic Tools and Internal Control

Estimator	Predictors	t-value
R-Squared	0.7100	Internal Control = 5.99.
Adjusted R-Squared	0.6014	T-Probability = 0.000
F-Ratio	23.02	
Probability. F	0.000	

Source: Compiled by the Researcher (2025)

Table 5 is the regression result for digital forensic tools and internal control of the SMEs in Delta State. The regression results showed that R^2 is 0.7100; indicating that digital forensic tools explained about 71% of the systematic variation in internal control of the selected SMEs in Delta State.. Thus, the model of digital forensic tools and internal control provides a good fit to the dataset of the study.

The F-ratio is 23.02 and this suggests that digital forensic tools significantly influence internal control of the SMEs in Delta State. In addition, the t-value suggests that digital forensic tools positively significantly affect internal control of SMEs in Delta State, Nigeria. This finding agrees with the results of Oyedokun (2020) and Popoola, et al (2019) who found significant influence of forensic tools on fraud detection, controls and performance of companies.

Table 6: Regression Results for Digital Forensic Tools and SMES Financial Performance

Estimator	Predictors	t-value
R-Squared	0.8710	Performance = 8.66
Adjusted R-Squared	0.7222	T-Probability = 0.000
F-Ratio	33.42	
Probability. F	0.000	

Source: Compiled by the Researcher (2025)

Table 6 is the regression result for digital forensic tools and financial performance of the SMEs in Delta State. The regression results showed that R^2 is 0.8710; indicating that digital forensic tools explained about 87% of the systematic variation in financial performance of the selected SMEs in Delta State.. Thus, the model of digital forensic tools and internal control provides a good fit to the dataset of the study.

The F-ratio is 33.42 and this suggests that digital forensic tools significantly influence financial performance of the SMEs in Delta State. In addition, the t-value suggests that digital forensic tools positively significantly affect financial performance of SMEs in Delta State, Nigeria. This finding agrees with the results of Oyedokun (2020) and Popoola, et al (2019) who found significant influence of forensic tools on fraud detection, controls and performance of companies.

Conclusion and Recommendations

Digital forensic tools have become indispensable for strengthening the financial and operational resilience of Small and Medium-sized Enterprises (SMEs) in Delta State. Their application not only enhances fraud detection and error prevention but also promotes accountability, transparency, and compliance with regulatory standards. Given that SMEs in Delta State often operate with limited resources and weak internal control systems, the integration of forensic tools offers a cost-effective means of safeguarding digital assets and financial records. The study confirms that digital forensic tools are highly effective in strengthening SMEs' operations. Specifically, they enhance fraud detection, improve financial performance and significantly strengthen financial accountability and

internal controls. Thus, digital forensic tools play a vital role in reducing fraud risk, boosting transparency, and ensuring better financial outcomes for SMEs.

Moreover, these tools support better decision-making by providing reliable data analytics and evidence preservation. The adoption of forensic technologies can also foster greater stakeholder confidence, as investors and regulators place increasing value on integrity and credibility in business practices. In a competitive and fraud-prone environment like Nigeria, SMEs that embrace digital forensic tools are more likely to sustain growth, mitigate risks, and achieve long-term survival. Based on the findings, the study recommends that SMEs in Delta State should be encouraged to adopt digital forensic tools as part of their standard accounting and auditing practices, since they demonstrably improve fraud detection and accountability. In addition, training programs should be organized for accountants, auditors, and managers to improve their digital forensic skills and ensure effective tool utilization.

Furthermore, government and regulatory agencies should provide incentives (such as tax breaks or grants) to SMEs that adopt forensic tools, encouraging widespread use. Also, digital forensic tools should be embedded into SMEs' internal control frameworks to strengthen fraud prevention and ensure better monitoring of financial activities. Overall, professional accounting bodies and SMEs associations should raise awareness about cost savings, fraud reduction, and performance benefits of digital forensic adoption.

Cost of Capital on Financial Performance of Selected Quoted Consumer Goods Companies

OKWU, Peter Ifeanyi

Alex Ekwueme Federal University

Ndufu Ebonyi Nigeria

peterify2015@gmail.com

Publication Date: 2025/11/28

Abstract

The study examined the effect of cost of capital on financial performance of selected quoted consumer goods companies in Nigeria. The specific objectives were to ascertain the effect of weighted average cost of capital on financial performance of listed consumer goods companies in Nigeria and to determine the effect of market value of equity on financial performance of listed consumer goods companies in Nigeria. The study adopted ex-post facto research design. The study data were sourced from annual financial statement of ten selected consumer goods companies in Nigeria. The stated hypotheses were analysed with descriptive statistic, correlation coefficient and panel regression. The correlation coefficient result revealed that weighted average cost of capital and market value of equity have positive relationship with financial performance of listed consumer goods companies in Nigeria. The panel regression revealed that weighted average cost of capital had positive and significant effect on financial performance of selected listed consumer goods companies in Nigeria and Market value of equity had positive and significant effect on financial performance of selected listed consumer goods companies in Nigeria. It was recommended that listed consumer goods companies should continue to embrace the use of equity financing. In conclusion, effective and efficient cost of capital will enhance the financial performance of consumer goods companies.

Key words: financial performance, consumer goods, weighted cost of capital, market value

Introduction

The manufacturing sector of any economy is the key sector that springs up the availability of goods and services for human consumption and supply of raw materials for other sectors to grow by taking into consideration shareholders value creation and wealth maximization. The main goal of corporate organizations are to improve financial performance, minimize the cost of capital, create value, and provide dividends to shareholders (Khan, Mustafa, & Abu, 2022). Unfortunately, the separation of ownership from control engenders a specific issue known as the agency dilemma, arising from conflicting interests, along with its associated repercussions and cost implications. A way to figure out an organization's cost of capital that takes into account both its own money and money that its sourced from external ways and means as the average cost of capital (WACC). The firm's financing choice is substantially swayed by the cost of capital, which acts as a vital link between the investment decision and the financing decision (Rasheed & Siddiqui, 2019; Isaac & Marshal, 2020; Ahmed et al., 2021).

The cost of capital has a big impact on financial success, because it determines investments, profits, the value of the business, and loan payments

(Ibrahim, Abdelkarim, Muktar & Peter, 2021). To get the best financial results and the most value for shareholders, the cost of cash and investment returns must be perfectly balanced. In Nigeria of today, the manufacturing industries are marked by escalating production costs attributed to elevated tariffs, increasing energy input expenses, high financing prices, and a shortage of foreign currency (FX), insufficient infrastructure, among other factors, such that the industrial capacity utilisations have been consistently low in recent years, averaging 57.8 percent in 2019. (Chukwu & Nduka, 2022).

However, researches have attributed several factors like the insufficient infrastructure, high energy costs, and restricted access to finance, high capital costs, ineffective governance structures, unstale financial system, agency costs, and informational asymmetries to have contributed to Nigeria's low manufacturing capacity utilisations, thereby making businesses to pay a lot to borrow money since they can't get credit easily or the interest rates are too high (Yusuf & Mbatuegwu, 2021). Notwithstanding, the high demand for consumer goods across the globe have made many organizations to capitalise on the opportunity to provide consumer-packaged items to meet these needs. Yinka (2019) noted that the Director General of the Manufacturers Association

in 2018 observed that over 50 percent (%) of manufacturing sub-sectors had experienced a decline in profitability of 2017 and perhaps may have led to closure of some factories. The buildup of debt and the failure to repay loans to creditors are the primary causes of the financial crisis and bankruptcy faced by several firms.

Statement of Problems

The 2008 global economic crisis which originated in the United States and subsequently affecting several nations, including Nigeria, has affected the input of costs of capital and other expenses for enterprises. Certain companies for instance; Enron, Maxwell Communications, and Cadbury, were declared bankrupt owing to accumulated debt resulting from superb performance attributed to accelerated capital costs (Abubakar, Oluwafemi & Esenohor, 2022). This cost of capital constrains the ability to pursue lucrative ventures and grow operations. One of the disadvantages of cost of capital is the reduction in profitability, because firms find it challenging to produce returns that surpasses cost of finance (Ibrahim, Abdelkarim, Mukhtar & Peter, 2021). This allegedly has reduced the values of shares, eroded investors confidence, and distorted the strengths of many companies that engaged in consumer goods. In Nigeria, the rise in the rate of cost of capital is alarming and this has created a wide gap in literature in and across border.

Nworie, Onyeka and Anaike (2023), argued that the effect goes beyond individual businesses and have rippled negative effect on the economy because, an unfair cost of capital has an attribute of crumbling the economic growth, job creation and reduces the overall development of a society. Orji and Agubata (2021), Ibrahim, Mukhtar, Abdulkarim, (2021), and Giwa (2019), in a separated studies narrated the resulting conflicts in empirical evidence on the exclusively appraised of either the cost of capital on firm performance and economic performance with divergent views and recommendations. Hence, the motivation of this study arose from the deficiencies and gaps in literature. indicating a need for a comprehensive examination of cost of capital with the following objectives.

1. To ascertain the effect of weighted average cost of capital on financial performance of listed consumer goods companies in Nigeria
2. To determine the effect of market value of equity on financial performance of listed consumer goods companies in Nigeria.

Review Of Related Literature

Market value of equity

When making an investment selection, fiscal performance is a major consideration for many organizations that optimizes profits. If an enterprise wants to keep its high firm value and attract investors, it has to improve its fiscal performance. Alternatively, stock price movements are always reflective of an enterprise's fiscal health; nonetheless, there are situations when other factors have a greater sway on stock price movements than the firm's

health. Investors' opinions on an enterprise's worth determine its Market Value of Equity (MVE). Observed in Shea (2019), market capitalization, or MVE, is the sum of an enterprise's share values or multiplying the sum of outstanding shares by the closing price of the enterprise's shares yields the MVE. The market value of equity measures a security's worth by comparing its share price to the amount of dividends given out each year, hence MVE is tied to stock prices. Stockholders' dividends are defined as a percentage of an enterprise's stock market price. When deciding whether or not to put money into an investment, the idea of the equity's market value is crucial.

For income-focused investors, the market value of stock is also quite important. Considering the present value of the stock on the market. The market's valuation of an enterprise is reflected in its equity market value. Management-created value (MVE) is therefore a proxy for management-created value beyond the value of investors' money. Since the market value of debt is often unavailable, the market value of equity and book value of debt are the two components that make up a public limited enterprise's market value. an enterprise's MVE indicates the quality of its investors.

Weighted Average Cost of Capital

An organization's total cost of capital, including debt, equity, market value, and taxes, is known as the weighted average cost of capital, or WACC. The sum of all the money that the enterprise has spent on its assets, broken down by the percentage that each part of the capital makes up. Due to inadequate funding, several startups failed during the first few years of operation. The same holds true for how an enterprise funds its working capital operations and investments; these factors determine the enterprise's viability. Internally, an enterprise may use its profits to support operations, and externally, it can raise capital via the sale of shares to the public for subscription or the taking out of loans. The borrowings made by businesses in the form of bonds or debentures are often referred to as debt, while equity refers to the sale of shares to the public as a whole. Mumtaz, Rauf, Ahmed, and Noreen (2013) argued that equity market has a trivial role in meeting financing needs of firms compared to the total amount of bank credit in issue.

However, Myers theoretical perspective of (1984) maintained that equity is not the best way to raise capital because investor's view managers issuing new equity as taking advantage of the firm's overvaluation. An enterprise may choose between three different financing options when working with an external source; all debt, all equity, or a combination of the both. (Ohayemi, & Fakayode, 2021). Gurnam (2012), subscribed to the view that whenever funds have to be secured, the financial manager should weigh the rewards and disadvantages of the various sources of funds and choose the more profitable sources keeping in view the expected capital structure. Okolo, Okwu, Ugwuoke and Kornom-Gbaraba (2019) argued that choice of any corporate body to structure its equity

financing in this era has become a thing of concern. Hence, it has become necessary for the firm's management to describe the cost of their loans and equity when selecting the ideal resources, and appraise the implications of these costs on the firm's fiscal performance. Utilising the right combination of funds may bring down the price. The worth of an enterprise and its economic profit are both enhanced when the financing cost declines. Management relies on the financing cost concept when making decisions, however there is currently no accepted way to calculate the WACC, especially for equity financing (Chen, Jorgensen & Yoo, 2004). In computing for cost of debt, only the returns that creditors anticipate are computed, while the Cost of Equity (COE) just analyses the returns that owners anticipate, but WACC encompasses the total cost of capital metric making it a more accurate reflection of the real cost of capital.

Financial Performance

One of the management methods that is utilised to assess the effectiveness of directing and controlling the application of fiscal resources and resources into an organisation is performance. Opuene (2022) opined that performance is a subjective measurement that represents how well a firm is able to produce revenues and utilise assets that are located in its major business location. Financial performance is a means to assesses how effectively businesses utilise their resources in creating returns (Bacha & Attia, 2016). Financial performance is a vital tool for many stakeholders in an enterprise since it measures how well firms use their resources and an objective measure of how successfully an enterprise uses assets from its principal method of operation to create revenues.

Many variables have been employed to measure and represents financial performance and one of such is return on assets (ROA) which refers to the capacity of a business unit to acquire a certain quantity of assets that are held by the business unit. ROA is a statistic that provides the stakeholders with information about the efficiency and how a firm utilises its assets to create money. The net income that is created by all assets is what is referred to as the rate of ROA. Abbadi and Abu-Rub (2016) argued that the ROA is a performance indicator that shows the relative profitability of a business endeavour during a certain time period. It assesses the efficiency with which an enterprise's assets are utilised to create cash. These assets are either obtained via the purchase of debt from debt holders or through the purchase of stock from shareholders. ROA is a measure that indicates how lucrative a firm is in comparison to the total assets.

Firm Size

The firm size as a moderating variable may be considered as one of the factors that might sway profits. In most cases, the amount of return and profitability is determined by the size of the firm. As the size of an organisation grows, it may be exposed to a greater sum of hazards and have access to a greater sum of resources. As a result, bigger firms

are more likely to execute an enterprise resources program. The empirical researches have as proven with evidence that there is a substantial favourable association between the size of the enterprise and the adoption of enterprise programs. Against the study of Okolo *et al.* (2019), that observed that the financing cost has an unfavourable correlation with the firm size. However, bigger firms perhaps choose a more riskier investment owing to the profitability level of such Investment than a smaller firms that are risky averse in nature. Firm size and financial performance are positively or negatively correlated depending on the size and structures of operations.

Theoretical Framework

An explanation for managers' investment financing choices is the pecking order theory as proposed 1961 by Donaldson's but modified in Myers and Majluf (1984). The propounder of this theory argued that internal financing is the most practical and cost-effective option for satisfying external stakeholders' demands for better returns. The pecking order idea is that, organisations' preferred methods of funding are ranked in order of preference such that retained profits should come first, thereafter issuance of debt, and lastly, the issue of stock.

This theory further estimated that large companies would make references to to use internal source of financing to generate more capital for internal financing needs, if necessary, the company seeks external sources of debt. If a company uses internal funds to experience a financial deficit, they will prefer to use safe funds, namely debt than equity source of financing. Octavia, Wicaksono, Sari, & Mambay (2021).

Myers and Majluf's (1984) postulated that insiders and outside investors share irregular information. Managers have an insider's view of the enterprise's real worth in comparison to outside investors. The consequences of taxes, the cost of distributing new shares, intervention expenses, and the economic pain of the enterprise prospects are not considered by pecking order theory, which is among its many shortcomings.

Khan and Nafees (2013) argued that the allowance of a perfect market, preference for internal finance over debt, and absence of an objective capital structure are all assumptions are all the assumptions made in using pecking order theory. Internally generated funds, debt issuance, and equity issuance are the three pillars upon which pecking order is rested. A business should tap into its own cash reserves before turning to external sources of funding like debt and stock offerings. The theory is owing to the idea of asymmetric information, which states that managers have access to knowledge about all of the enterprise's investments and projects, revealing the firm's actual values, but investors do not.

Empirical Review

The study of Orinya, Kado, Kurfi, Bala (2024) which sought to mediate the ways of WACC in Nigeria. The secondary data were culled from the

yearly reports of fifteen consumer products businesses that were made public on the Nigerian stock market from 2005 to 2019. The research found that debt ratio substantially affects financial performance as assessed by ROA and EPS. It was recommended that the firms' management teams should use a mix of 50% debt and 50% equity capital. The factors influencing share prices on the Colombo Stock Exchange (CSE) were also the subject for Gineshi, Diwakara, and Nuwan (2024). In the study, the dependent variable is the share price while the independent variables are firm's COE, COD, and WACC. The upshots of the descriptive, correlational, and regression analyses revealed a statistically substantial interaction between the share price and the WACC, cost of debt, and COE of manufacturing firms. The study recommended that both the Investors and the firms management should consider the projection of share price movements in the capital market before undergoing such investments.

Tamunotonye and Obutor (2023) researched on the effect of cost of capital on firm performance of listed construction firms in Nigeria from 2012 to 2021. It employed the ex-post facto design and conducted some diagnostic tests, including tests for multicollinearity and heteroscedasticity and engaged the ordinary least square (OLS) regression to observe interaction between variables. The results showed that cost of debt had an insubstantial unfavourable outcome on firm performance, while COE had an insubstantial favourable effect on firm performance, as measured by ROA. The study suggested that available options should be employed for cost effectiveness. Ogiriki and Olorunleke (2023) sought to assess how the financing cost, including loan and equity costs, impacted the financial performance of construction firms in Nigeria from 2008-2017. The study was built on ex post facto design. It made use of the multiple Linear Regression and descriptive statistics to test the hypotheses in the research. Among others, the study revealed that the financial performance is unfavourably affected by cost of debt.

Ochoki, Oloo, and Kamau (2023) studied the effects of cost of capital on firm performance in Kenya. The study argued that the cost of capital is affected by various factors such as interest rates, inflation, market conditions, and government policies. But financial managers are only interested in the use of discounting cash flow techniques to evaluate capital

investments, which requires the estimation of the project's cash flows and the discount rate. The research maintains the need for a mix of financing sources between debt and equity because high costs of capital can limit a firm's access to financing, while low costs of capital can improve a firm's investment and growth opportunities. Marshal, Chigozirim, and Edeh (2023), investigated the impact of cost of capital on market value of manufacturing companies in Nigeria from 2007-2021. The variables of consideration are cost of debt, the COE, WACC, and share prices. It made use of the purposive selection technique to choose 15 manufacturing enterprises from a pool of 63 that were listed. The study employed a variety of econometric methods such as, Unit Root Test, Co-integration Test, Granger Causality Test, and Panel data regression, addition to descriptive and inferential statistics, to analyse the secondary data. Okolo, et al. (2019), examined the implications of equity capital financing on the corporate financial performance of deposit money banks in Nigeria. It made use of 14 banks on the Nigerian Stock Exchange for a period of 11 years. It adopted the ex-post facto research design, and Pooled Ordinary Least Square Method and the analysis used panel data structure with E-View package (version 13). It also revealed that both ROE AND EVA have a positive effect on the corporate financial performance of Deposit Money Banks in Nigeria. It recommended that the implications of scheduling banks capital into equity financing, short-term debt and long-term debt by managers should be closely supervised and monitored by both shareholders and bondholders' so as to avoid the company adding negative value to them who are contributors of finance.

Methodology

This study focused on manufacturing firms quoted on the Nigerian Exchange (NGX) for a period of 16 years 2008-2023 with 160 observations. It adopts the *ex-post facto* design. ten manufacturing firms were observed with 160 observations. The information obtained are secondary in nature collated from the annual reports and accounts of the firms, the purposive sampling was used to generate a sample size of ten (10) consumer goods since the population was fewer than thirty. The sampled firms and the year of listing are:

Table 3.1: Targets 10 sample consumer goods firm

S/N	Name of Company	Year of Incorporation	Year of Listing
1	Cadbury Nig.	1965	1976
2	Dangote Sugar	2005	2007
3	Flour Mills of Nigeria	1962	1979
4	Guinness Nig.	1950	1965

Model Specification

The model was adopted from Giwa (2019) and modified to suit the hypotheses of this study as follows: one.

$$ROA = f(WACC, MV, FS \epsilon) \quad \text{equ.1}$$

Explicitly rewritten as:

$$ROA_{it} = \beta_0 + \beta_1 WACC_{it} + \beta_2 MV_{it} + \beta_3 FS_{it} + \epsilon_t \quad \text{equ. 2}$$

Modified into to log forms in order to be well captured as:

$$LOG ROA_{it} = \beta_0 + \beta_1 LOG WACC_{it} + \beta_2 LOG MV_{it} + \beta_3 LOG FS_{it} + \epsilon_t \quad \text{equ. 3}$$

Where:

LOG ROA = Log of Return on Asset as proxy financial performance

LOG WACC = Log Weighted Average cost of capital

LOG MV = Log of Market Value of Equity

LOG FS = Log of Firm Size

β_0 = constant slope to be estimated; β_1 - β_5 = parameter estimate

ϵ_t = error term; i = firm, t = time period, *A priori expectation:* $\beta_0 + \beta_1 + \beta_2 + \beta_3 > 0$.

Presentation of Results and Discussion

Descriptive analysis

The descriptive analysis displayed the basic features of the cross Sectional and time series data. The outcome of the descriptive analysis is presented in table 4.1.

Table 4.1: Descriptive Analysis

	ROA	FS	MV	WACC
Mean	10.7526	625.8131	737190.1	6834530

Source: Researcher computation from E-View 12, 2023.

From the descriptive analysis in table 4.1, the mean value of ROA for the period was 10.7526. ROA of about 10.7 percent is indicated by the mean figure, which pertains to the sample of Nigerian consumer products enterprises. A return on asset might be as high as 79.7581 or as low as 0.12, due to the data set.

With a maximum ROA of 79.8 percent, it is clear that the majority of the firms under consideration were doing well. One way to look at the dispersion of data relative to the mean is by utilising a standard deviation. Data points are more densely packed around the mean when the standard deviation is

small, and dispersed when the standard deviation is big. Since ROA had a small standard deviation of 11.2189 across the research period, we may infer that the data were well concentrated around the mean. The skewness shows an imbalance of a normal distribution. This means that the data set has outliers or extreme values in its distribution. Also, skewness of the data-set had a favourable value of 2.95840, meaning the data is skewed to the right. Kurtosis is utilised to measure how data disperse between a distribution's center and tails, with larger values indicating a data distribution may have “heavy” tails that are thickly concentrated with observations or that are long with extreme observations. Observably, the kurtosis was 16.0153 > 3, which revealed that the dataset has heavier tails than a normal distribution. Additionally, the average firm size (FS) was 625.8131. The average FS is 625 percent, which means that consumer goods businesses grew in size by an average of 625 percent over the research period. The maximum value of FS was ₦29,390,260 while the minimum value of COE was ₦10075.80. Standard deviation of COE for the period was 452674.7 which shows that the standard deviation was high and that the data are a far from the mean over the period. The skewness of the study shows a favourable value of 5.121569, meaning that the data is skewed to the right and Kurtosis, was 28.86836 > 3, which is the normal value, this indicates which indicates the dataset has heavier tails than a normal distribution.

Furthermore, the mean value of market value of equity (MV) for the period was 737190.1. The maximum value of MV was ₦1,800,000 while the minimum value of MV was ₦1.793608. Standard deviation of MV for the period of this study was 1595180 which shows that the standard deviation

was high and that the data are a far from the mean over the period. The skewness of the study shows a favourable value of 8.191372 meaning the data is skewed to the right and Kurtosis, was 87.23392 > 3, which is the normal value, this indicates which indicates the dataset has heavier tails than a normal distribution

Furthermore, the mean value of market value of equity (MV) for the period was 737190.1. The maximum value of MV was ₦1,800,000 while the minimum value of MV was ₦1.793608. Standard deviation of MV for the period of this study was 1595180 which shows that the standard deviation was high and that the data are a far from the mean over the period. The skewness of the study shows a favourable value of 8.191372 meaning the data is skewed to the right and Kurtosis, was 87.23392 > 3, which is the normal value, this indicates which indicates the dataset has heavier tails than a normal distribution.

Additionally, the WACC for the given time frame was 6834530. There was a somewhat high financing cost for the research during the study period, as shown by the average WACC of 6834530. There is variation in the WACC among the consumer goods companies. The maximum value of WACC was ₦5991723 while the minimum value of MV was ₦2.458280. Standard deviation of WACC for the period of this study was 997883.8 which shows that the standard deviation was high and that the data are a far from the mean over the period. The skewness of the study shows a favourable value of 2.734797 meaning the data is skewed to the right and Kurtosis was 10.77431 > 3, which is the normal value, this indicates which indicates the dataset has heavier tails than a normal distribution.

Table 4.2: Summary of correlation coefficient

	ROA	FS	MV	WACC
ROA	1.0000			
FS	0.00412	1.0000		
MV	0.11970	0.0243	1.0000	
WACC	0.00377	-0.0062	-0.0239	1.0000

Source: E views 12 computations, (2024)

The correlation coefficient as obtained in Table 4.2 emphasized on the link between the dependent variable, ROA, and the independent variables vis-a-vis the moderating variable. The correlation coefficients range from -1 to 1. The link's indication reveals the direction of the connection (favourable or unfavourable), while the absolute values of the

correlation indicate the strength, with bigger values signifying stronger correlations. The upshots indicated a favourable correlation between ROA and firm size (FS), market value of equity (MV), and WACC, with correlation coefficients of 0.00412, 0.11970, and 0.00377, respectively.

The Hausman test in table 4.3, was conducted to determine the appropriate model between the random effects model and the fixed effects model in the study. This served as a test to identify the appropriate model between the fixed and random-effects models. The Hausman test posits the null hypothesis that the random effects model is preferable, while the alternative hypothesis asserts the superiority of the fixed effects model. The

random effects model was chosen because the p-value of Hausman's test exceeds 0.05. This indicates that the research accepts the null hypothesis of the Hausman test and rejects the alternative hypothesis that the random effects model is favoured. Therefore, the random effects model was utilised as the most effective estimator of the impact of capital costs on the fiscal performance of selected publicly listed consumer goods firms in Nigeria.

Table 4.4: Summary of Panel Regression (dependent variable, ROA)

Variables	Fixed Effect Model	Random Effect Model + +
FS	3.054308 (0.87511)	2.759866 (2.486020)***
MV	3.054308 (0.885920)	2.933908 (2.463723)**
WACC	-1.701614 (-0.638572)	2.978604 (2.704591)***
C	18.07022 (7.536795)***	18.13506 (4.606381)***
R-Squared	0.581917	0.764213
Adjusted R-Squared	0.512585	0.727515

*** and ** denotes significance @ 5 percent level, respectively. Values in parenthesis () are t- values of variables, ++ show the accepted Model

Lucky (2017) contended that the focus on panel regression relies on either the fixed effect model or the random effect model, depending upon the upshots of the Hausman test. Kurt asserts that the pooled OLS estimator disregards the panel structure of the data, resulting in inaccurate parameter estimates and standard errors. In congruent with the Hausman test outlined above, the selected model is the random effects model, since it exhibits the maximum sum of substantial variables and is also the model favoured by the Hausman test. In congruent with the random effects model, the adjusted R-squared value of 0.727515 signifies that the firm size (FS), market value of equity (MV), and WACC collectively explain 73 percent of the variance in ROA as the dependent variable, while the

Test of Hypotheses

Table: 4.5. Test of Hypothesis 1

H0₁: Weighted average cost of capital has no significant effect on financial performance of selected consumer goods companies in Nigeria,

Variable	Coefficient	t-statistic	Prob.
Log WACC	2.978604	2.704591	0.0068

Source: *Extracted from panel regression result table*

At a significance level of 5 percent, the data in the table 4.5 shows that the Log WACC coefficient is 2.978604, the p-value is 0.0068, and the t-statistic is 2.704591. At the 5 percent level of significance, the p-value is below

Table: 4.6 Test of Hypothesis 2

H0₂: Market value of equity has no substantial effect on financial performance of selected consumer goods companies in Nigeria.

Variable	Coefficient	t-statistic	Prob.
Log MV	2.933908	2.463723	0.0214

Source: *Extracted from panel regression result table*

At the 5 percent level of significance, the following values are shown in the table: 2.933908 for the coefficient of the Log MV, 0.0214 for the probability value, and 2.463723 for the t-statistic. With a favourable coefficient and a p-value below 0.05 at the 5 percent threshold of significance, we may accept alternative hypothesis one. It follows that the fiscal performance of a subset of Nigerian consumer goods businesses made public on stock exchanges is favourably and substantially impacted by their market value of equity.

remaining 27 percent is attributed to the error term. The F-statistic probability of 0.003127 indicates that the upshots are statistically substantial.

The t-statistic for firm size (FS) was 2.486020 with a probability value of 0.0118, indicating that company size (FS) had a favourable and substantial sway on the ROA of the chosen consumer goods businesses in Nigeria. The T-statistic for the market value of equity (MV) was 2.463723, with a probability value of 0.0214, indicating that the market value of equity (MV) has a favourable and substantial sway on the ROA of the chosen consumer goods businesses in Nigeria. The T-statistic for the WACC was 2.704591, with a probability value of 0.0068, indicating that WACC has a favourable and substantial sway on the ROA of the chosen consumer goods businesses in Nigeria.

0.05, and the coefficient value is favourable, hence alternative hypothesis one is accepted. This suggests that a sum of listed Nigerian consumer goods businesses' financial performance is favourably and significantly impacted by WACC.

Discussion of Results

The purpose of this research was to appraise the impact that the cost of capital has on the fiscal performance of a selection of consumer products firms that are listed in Nigeria. Between the years 2008 and 2023, the research was conducted.

H0₁: Weighted average cost of capital has no substantial effect on financial performance of selected consumer goods companies in Nigeria

In congruent with the upshots of the third hypothesis, the WACC has a favourable and substantial impact on the performance of a selection of consumer goods businesses that are listed in Nigeria. In congruent with this finding, the WACC is an extremely

important factor to consider when making fiscal decisions for a company. As a result of the WACC, a crucial choice must be made on whether to accept debt financing or equity financing, taking into consideration the effect that this funding will have on costs. It is possible to calculate the rate of return by utilising the WACC. This rate of return represents the return that shareholders need in a way to purchase capital. The risk of cash flows and the attractiveness of firm shares, projects, and possible acquisitions are also evaluated by investors with the assistance of this system. In addition to this, it determines the discount rate for future cash flows, which is necessary in a way to determine the value of a company. The upshots of the study seem to be consistent with the upshots of the research. Ibrahim and others (2021). The fact that the WACC has a favourable and substantial sway on the variables that measure fiscal performance (ROA) suggests that shareholders are more interested in investments that result in an upsurge in the value of the company. It also indicates that the value of the company will grow while the COC of the company is decreasing.

H02: Market value of equity has no substantial effect on financial performance of selected listed consumer goods companies in Nigeria.

In congruent with the upshots of the previous hypothesis, the market value of equity has a favourable and considerable impact on the fiscal performance of a sum of consumer goods firms that are listed in Nigeria. The conclusion is supported by the fact that the market value of stock represents the market's assessment of the current worth of a firm. In the majority of cases, prior to making an investment choice on a certain business, investors will first consider the market worth of the stock that the company has. Specifically, this is due to the fact that the market value of the firm's stock reflects the overall success of the company within a given year. In congruent with Marshal (2023), the upshots of the study are consistent with the upshots of the research. On the other hand, the coefficients of firm size (SIZE), market value (MVE), sales growth (GROWTH), and ROA variables are favourable, which is consistent with the research performed by Francis et al. (2005), Lopes and Alencar (2010), and Reverte (2012); however, it was discovered that these coefficients were statistically insubstantial during the time period that was appraised. Contrary to what is found in the literature. Owing to the analysis of the models, it has been shown that the size of the company has a favourable sway on the ROA.

Summary of Findings

A sum of publicly traded Nigerian consumer goods firms had their financing needs analysed to determine the impact of cost of capital. The study howvver showed that:

1. The financial sucesss of some listed consumer goods businesses in Nigeria is favourably and substantially impacted by their WACC.
2. The fianancual performance of some listed consumer goods businesses in Nigeria is favourably and substantially impacted by the market value of equity.

Conclusion

The expansion and profitability of consumer products firms in Nigeria and throughout the globe are heavily swayed by the choices they make about financing. In a way to maximise shareholder value, it finds the optimal debt-to-equity ratio for the fiscal structure. When companies are deciding how to finance themselves, financing cost is a major factor. Investment managers strive to choose a capital structure pattern that minimises financing cost while maximising return for the firm, taking into account the varying degrees of risk associated with different financing sources. For analysts and investors, the financing cost is a key metric.

If a company's projected return on capital is greater than its financing cost, then the investment becomes substantial. This is due to the fact that increasing business value necessitates maximisation of profits for the benefit of shareholders. Companies' financial performance is impacted by the financing cost, which must be acknowledged (Alrjoub & Ahmad, 2017). As a means of acquiring money for long-term projects, the Nigerian capital market is undeveloped in comparison to its international equivalent, which means that its value is low. Consequently, the principal duty of carefully collecting money from economic surplus units and directing them to the deficit sector to cover its capital requirements in the long run has not been duly carried out. The high financing cost is a result, for example, of the limited liquidity of the Nigerian capital market, which is caused by the small sum of listed businesses, low transaction volumes, and low market capitalisation. Most research on the topic have focused on other nations, therefore there is still a lack of understanding on how financing cost affects fiscal performance, even if there is more and more literature on the subject. So, the research. A sum of publicly traded Nigerian consumer goods firms had their fiscal performance analysed to determine the impact of financing cost. In conclusion. A company's bottom line will benefit from a financing cost that is both effective and efficient.

Recommendations

The researcher offered the following suggestions:

1. It is recommended that consumer goods companies made public onstock exchanges maintain a capital structure that is roughly 50 percent debt and 50 percent equity. This is because the average of these two factors greatly impacts financial health of the said entites

performance, which in turn ensures long-term sustainability.

2. Owing to the market value of equity, managers of listed consumer goods businesses in Nigeria should choose equity borrowing over debt borrowing when it comes to financing their operation.
